Q. 3. Do you remember visiting Mr. Drawbaugh's shop, at one time, in company with Mr. John A. Oyster, who is now present?

A. Yes, sir; I do.

Q. 4. Are you able to fix the day or year of that visit?

A. Of my own memory, it was either in 1874 or 1875. I am positive that it was not later than 1875, and I think it was in May or June, but am not positive.

Q. 5. Do you remember on what day of the week it was?

A. On the Sabbath.

Q. 6. Did Mr. Drawbaugh, on that occasion, exhibit any talking-machines to you and Mr. Oyster?

A. Yes, sir; he did.

Q. 7. Did he talk through them to you?

EPHONE COMPANY,-1

A. Yes, sir.

Q. 8. Where was he when he was talking through them, and where were you when you were listening at the machine?

A. Mr. Drawbaugh was up on the second story of his machine-shop, and I was down below in the cellar, under the machine-shop.

Q. 9. How many floors were there between you and him?

A. Two.

Q. 10. Were there any doors, and if so, were they closed while the talking was going on?

A. There were two doors. I can't be positive about them both being closed, but one of them was.

Q. 11. From where Mr. Drawbaugh was to where you were when you were listening, could you or could you not have heard what he said without the aid of the machine?

A. No, sir; you could not have heard it, unless he would have hollowed very loud.

Q. 12. Did you hear and understand what he said through the machine?

A. Yes, sir; I did, part of it. I could not understand him—all. I remember of him singing "Yankee Doodle" in it. That I can remember as distinctly as if it was to-day yet.

Q. 13. Did he sing the words of "Yankee Doodle," or only the tune?

A. He sang the words.

Q. 14. Did he talk, or ask any questions through the machine, besides singing through it?

A. Yes, sir; he did, but the words and the questions I can't remember any more what they were.

Q. 15. How did you know that it was Mr. Drawbaugh who was talking through the machine while you were listening?

A. I could understand his voice—that it was his voice. When I put the machine to my ear, I could understand it very distinctly.

Q. 16. If there had been a good many other persons in the room above with Mr. Drawbaugh at the time, could you or could you not have recognized his voice, as distinguished from any other voice through the machine?

[*Question objected to, because the question is hypothetical, and because the witness has no means of answering it.*]

A. Yes, sir; I could have distinguished his voice.

Q. 17. Please look at the machines, "A," "B," and "F," now shown you, and state whether you ever saw them before, and if so, when you first saw them, so far as you recollect.

A. I have seen them before, or something like these These might be the machines. I first saw them on that Sabbath, when I was at the shop, as I have above testified.

Q. 18. Was it any one of these machines, that you listened at in the cellar? If so, which one?

A. This one, [indicating "A,"] or one like this one, I listened at.

Q. 19. Was that the one, or like the one you were listening at, in the cellar, when you heard him singing "Yankee Doodle," and talking and asking questions through the machine?

A. Yes, sir; this is the one, or one like it.

Q. 20. Was that machine at which you listened in the cellar connected in any way with anything in the room where Mr. Drawbaugh was, on the second floor above? If so, how was it connected?

A. Yes, sir; it was connected with wires. Two wires run from where Mr. Drawbaugh was down into the cellar, where I was, and connected to this machine "A."

Q. 21–22. While in the room where Mr. Drawbaugh was, on the second floor, did you see any vessel or vessels shaped like jars, and containing a green and white substance or liquid?

A. Yes, sir; I did. After I came up from the cellar, Mr. Drawbaugh showed it to me then.

Q. 23. What did he say about them when he showed them to you?

A. I can't remember his conversation any more. He explained to me, but I can't remember what it was.

Q. 24. Did they have anything to do with the talking-machine or not?

A. Yes, sir; they had.

Q. 25. Do you remember whether they were in any way connected with the talking-machine up on that floor, and if so, what do you remember about the connection?

A. Yes, sir; they were connected by two wires, to the best of my knowledge.

Q. 26. From the time when you were there at the shop with Mr. Oyster, as you have testified, down to the beginning of the year 1880, were you or not occasionally in Mr. Drawbaugh's shop again?

A. Yes, sir; I was.

Q. 27. Were you there during the time that Mr. Chellis has been manufacturing faucets and motors at that shop?

A. Yes, sir; I have been there since.

Q. 28. Did you see Mr. Drawbaugh doing anything with talking-machines during that time, since Mr. Chellis began manufacturing faucets and motors there?

A. Yes, sir; I did.

Q. 29. Were you there at the shop at any time or times when the Electric Clock Company, consisting of Mr. Shettel and the Grissingers, were carrying on business there at the shop?

A. Yes, sir; I was.

Q. 30. How often, to the best of your recollection, were you there while that Clock Company were carrying on business there?

A. May be five or six times, or perhaps more, in a year.

Q. 31. On Sundays, or week days, or both?

A. Principally on Sundays; I have been there on both.

Q. 32. What, generally, caused you to go there?

A. In the summer time we would go there to bathe in the creek, right close to the machine-shop, and Mr. Drawbaugh and I have been intimate friends, and I would always stop in to see him.

Q. 33. While the Electric Clock Company were carrying on business there at the shop, did you ever see Mr. Drawbaugh doing any work on his talking-machines?

A. Yes, sir; I did. He had a machine made to cover the wire, and I remember distinctly seeing him work at that part of it, and I asked him what it was for, at the time, and he told me it was for his talking-machine. That is the reason I know what it is for. I saw him frequently working at it, but principally on Sunday. The most work that I saw him doing at the talking-machine was on the Sabbath. This was the case that year and other years. In fact, I was oftener there on the Sabbath. He would attend church in the morning and go to work in the afternoon.

Q. 34. When you would be there at the shop from time to time between the summer of 1875 and the time the Clock Company started up, did you see Mr. Drawbaugh doing anything with his talking-machines?

A. Yes, sir; I did.

Q. 35. How often during that time?

A. Yes, sir; I could have distinguished his voice.

Q. 17. Please look at the machines, "A," "B," and "F," now shown you, and state whether you ever saw them before, and if so, when you first saw them, so far as you recollect.

A. I have seen them before, or something like these. These might be the machines. I first saw them on that Sabbath, when I was at the shop, as I have above testified.

Q. 18. Was it any one of these machines, that you listened at in the cellar? If so, which one?

A. This one, [indicating "A,"] or one like this one, I listened at.

Q. 19. Was that the one, or like the one you were listening at, in the cellar, when you heard him singing "Yankee Doodle," and talking and asking questions through the machine?

A. Yes, sir; this is the one, or one like it.

Q. 20. Was that machine at which you listened in the cellar connected in any way with anything in the room where Mr. Drawbaugh was, on the second floor above? If so, how was it connected?

A. Yes, sir; it was connected with wires. Two wires run from where Mr. Drawbaugh was down into the cellar, where I was, and connected to this machine "A."

Q. 21–22. While in the room where Mr. Drawbaugh was, on the second floor, did you see any vessel or vessels shaped like jars, and containing a green and white substance or liquid?

A. Yes, sir; I did. After I came up from the cellar, Mr. Drawbaugh showed it to me then.

Q. 23. What did he say about them when he showed them to you?

A. I can't remember his conversation any more. He explained to me, but I can't remember what it was.

Q. 24. Did they have anything to do with the talking-machine or not?

A. Yes, sir; they had.

Q. 25. Do you remember whether they were in any way connected with the talking-machine up on that floor, and if so, what do you remember about the connection?

A. Yes, sir; they were connected by two wires, to the best of my knowledge.

Q. 26. From the time when you were there at the shop with Mr. Oyster, as you have testified, down to the beginning of the year 1880, were you or not occasionally in Mr. Drawbaugh's shop again?

PHONE COMPANY,-1

A. Yes, sir; I was.

Q. 27. Were you there during the time that Mr. Chellis has been manufacturing faucets and motors at that shop?

A. Yes, sir; I have been there since.

Q. 28. Did you see Mr. Drawbaugh doing anything with talking-machines during that time, since Mr. Chellis began manufacturing faucets and motors there?

A. Yes, sir; I did.

Q. 29. Were you there at the shop at any time or times when the Electric Clock Company, consisting of Mr. Shettel and the Grissingers, were carrying on business there at the shop?

A. Yes, sir; I was.

Q. 30. How often, to the best of your recollection, were you there while that Clock Company were carrying on business there?

A. May be five or six times, or perhaps more, in a year.

Q. 31. On Sundays, or week days, or both?

A. Principally on Sundays; I have been there on both.

Q. 32. What, generally, caused you to go there?

A. In the summer time we would go there to bathe in the creek, right close to the machine-shop, and Mr. Drawbaugh and I have been intimate friends, and I would always stop in to see him.

Q. 33. While the Electric Clock Company were carrying on business there at the shop, did you ever see Mr. Drawbaugh doing any work on his talking-machines?

A. Yes, sir; I did. He had a machine made to cover the wire, and I remember distinctly seeing him work at that part of it, and I asked him what it was for, at the time, and he told me it was for his talking-machine. That is the reason I know what it is for. I saw him frequently working at it, but principally on Sunday. The most work that I saw him doing at the talking-machine was on the Sabbath. This was the case that year and other years. In fact, I was oftener there on the Sabbath. He would attend church in the morning and go to work in the afternoon.

Q. 34. When you would be there at the shop from time to time between the summer of 1875 and the time the Clock Company started up, did you see Mr. Drawbaugh doing anything with his talking-machines?

A. Yes, sir; I did.

Q. 35. How often during that time?

A. That I can't recollect how often. I saw him work at it, but the number of times I can't really say, and I did not see him just every time I came into the shop.

Q. 36. During that time, from the summer of 1875 to the spring of 1878, did you, or did you not, see him working at the talking-machine, or doing something with it, quite a number of times?

A. Yes, sir; I did.

Q. 37. As you would be in his shop from time to time, from the summer of 1875 to the beginning of 1880, did you see other talking-machines there that you had not seen in the summer of 1875?

A. Yes, sir; I did.

Q. 38. During those years, from the summer of 1875 to the year 1878 or 1879, did Mr. Drawbaugh ever state to you what he desired to accomplish by any of his improvements on his talking-machine? If so, state as nearly as you can what he said about it.

A. Yes, sir; he did. He stated to me that he wanted to accomplish, and could do it, to make a machine that you could stay in one corner of the room, and put the machine in the other corner, and hear as distinctly what was said in the machine, as well as putting it to his ear. He stated also that he was working at it on that principle, to improve it that he could hear across the room from one corner to the other.

Q. 39. How many times during the years 1875, '6, '7, '8, and '9, did you hear Mr. Drawbaugh make remarks to that effect?

A. I could not say how many times. Different times, when I would be in there, he would talk about it, and I have asked him questions about it, whether he had it accomplished. That I have done frequently, and his answer would always be, "No, sir; I am working at it, and I am going to get it accomplished." I can remember his words yet.

Cross-examined by Mr. Storrow:

Cross-Q. 40. Please tell me anything else that you remember that you heard Mr. Drawbaugh say about his talking-machine.

A. Indeed, I can't. He did say a good deal about it, but I can't remember it. He always had a great deal to say about it.

Cross-Q. 41. Please tell me all that you can remember, or anything that you can remember.

A. I have told about all that I know about it, that I can get into my memory at present.

Cross-Q. 42. Are these instruments, "A," "B," and "F," now on the table before you, in the same condition that they were in when you first saw them at Drawbaugh's shop?

A. No, sir; they are not quite in the same condition. The coating inside of this ["F"] was heavier and thicker than it is now; and also the coating in this one ["B"]; they seem to be the same in other respects. This machine ["A"] is the same, to my knowledge, that it was when I had a hold of it.

Cross-Q. 43. On that first Sunday, when you say that you and Mr. Oyster went to Mr. Drawbaugh's shop, who else was there besides you three?

A. No person, to my recollection, but us three.

Cross-Q. 44. Can't you recollect anything else that Mr. Drawbaugh said to you on that day about his talking-machines?

A. There is something came into my memory since I have been studying over it that I do recollect. It was that very day, too, Mr. Drawbaugh said that the talking-machine could be used to talk at a long distance; "from Philadelphia to California," are the very words that he used. I heard so much of it that I can't keep it in my memory.

Cross-Q. 45. What did you and Mr. Oyster go there for that Sunday?

A. To get a small cone, I think they term it, to put on the mowing-machine.

Cross-Q. 46. Do you mean it was one of Kline's conical patent axle fixings that you went there for?

A. Yes, sir; it was to connect to a mowing-machine, also. I don't think it was more than two inches long. It was only a small affair.

Cross-Q. 47. Were they making those Kline patent conical spindles there at the shop at that time?

A. Yes, sir; they were.

Cross-Q. 48. How far is White Hill from Drawbaugh's shop?

A. About one mile.

Cross-Q. 49. Who did you ever meet there on any of these Sundays, when you say you went there?

A. I declare if I can remember any person just personally. I have met different persons there, but to name them, I can't tell you who they were. I did go from my place direct to the shop one Sunday with a gentleman. Mr. Drawbaugh showed us the machinery that time. There were two of us together that time.

Re-direct by Mr. Hill:

Q. Q. 50. At the time you saw this machine "B" there, in the summer of 1875, on that Sunday when Mr. Oyster was there with you, do you remember whether the tin box was open at both ends, as it is now?

A. Indeed, I don't. I can't remember whether it was open or whether it was shut.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 2d day of June, 1881.
FRED. M. OTT,
Examiner.

GEORGE FREE.

Recess for dinner until 2, P. M.

June 2, 1881, 2, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

JOHN A. OYSTER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Twenty-nine; residence, Camp Hill, Cumberland county; occupation, farmer.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. I have known him about twelve years.

Q. 3. You were present this forenoon and heard a part of the testimony of George Free, I believe. Am I correct?

A. Yes.

Q 4. Do you recollect the incident that he mentioned of his being at Mr. Drawbaugh's shop one Sunday in company with you?

A. I do.

Q. 5. Are you able to fix the time of that occurrence? If so, when was it?

PHONE COMPANY,-1

A. Yes; it was on or about the 21st of June, 1875.

Q. 6. What did you go there for on that occasion?

A. Bear, Kline & Co. were manufacturing the compensation spindle and offered to put a journal on the connecting rod of my reaper and mower, and I took the machine there, used it, after taking it home, part of a day, which was on Saturday. I lost the cone from the journal, and could not use the machine until I got another. Not wishing to be detained on Monday, I drove to Mr. Drawbaugh's on Sunday, to get the lost part, and on my way I picked up George Free, who accompanied me to Mr. Drawbaugh's shop, where we found him working on what he called a talking-machine.

Q. 7. Was that repair made on the grain-cutting or grass-cutting part of the machine?

A. It was made on the grass cutting-part.

Q. 8. Was it your understanding at the time that Bear, Kline & Co. were to make such repair free of charge, or not?

A. They were to make it free of charge.

Q. 9. How are you able to fix the year 1875 as the year of that visit?

A. I began farming in 1874, and bought a second-hand reaper and mower, the pitman of which was about worn out, and I was required to get a new one before the machine could be used again. Bear, Kline & Co. suggested that, as I was getting a new one, I should use one of theirs to test the practibility of it. I believe that was about the way they spoke.

Q. 10. Did you have any further repairs made on that machine in the year 1876? If so, what and when?

A. In 1876 my grain-bar required the same attachment as the grass-bar had, which I had had put on in 1875. It was then put on to the grain-bar in 1876. It was some time either in May or June, because I cut wheat in the latter part of June.

Q. 11. Was that attachment to the grain-bar to be paid for?

A. No, sir; it was not to be paid for. It was part of the contract that they were to put it on, and I was to test it.

Q. 12. Did that firm of Bear, Kline & Co., or M. M. Grove & Co., do any other work for you in 1875 or 1876, except what you have stated?

A. No, sir.

Q. 13. Their books show a charge against you for some work done in June, 1876. Was that charge entered at the time of the first work or the second work which you had done?

A. I don't know. There was to have been no charge at all. If entered in June, 1876, it was at the time of the second work.

Q. 14. With whom—that is, with what member of the firm—did you make the arrangement to have the devices put on your reaper and mower without charge?

A. First, with Mr. Bear; afterwards, with the full consent of Mr. Kline and Mr. Grove.

Q. 15. When you and Mr. Free were in Mr. Drawbaugh's shop on that Sunday in June, 1875, do you recollect the circumstance of Mr. Free going into another part of the shop to listen, while Mr. Drawbaugh talked through his talking-machine?

A. I do.

Q. 16. Did you go with Mr. Free, or remain with Mr. Drawbaugh?

A. I remained with Mr. Drawbaugh.

Q. 17. Please look at the instruments now shown you, marked "A," "B," and "F," and state whether or not you remember seeing them there at Mr. Drawbaugh's shop on that day.

A. I recollect seeing instrument marked "A" and "B," and a machine that looked very much like the one marked "F." I think this ["F"] is the glass or machine that I seen.

Q. 18. Did you talk into any of the machines yourself?

A. I don't think I did.

Q. 19. From that Sunday in June, 1875, down to the beginning of 1880, were you occasionally at Mr. Drawbaugh's shop again? If so, how often, as near as you can remember?

A. About twice or three times a year, I think.

Q. 20. How far from Mr. Drawbaugh's shop did you live during those years, from the summer of 1875 down to the beginning of 1880?

A. About two miles.

Q. 21. As you would be there from time to time during all those years, did you see any more talking-machines that you did not see at the time of your visit in 1875?

A. I did see some instruments.

Q. 22. Give us your best recollection as to about how many.

A. There may have been two, three, four, or five; perhaps more.

Q. 23. Did they resemble the machines "A," "B," and "F" in form, or were they of a different form?

A. I remember a larger box or machine, perhaps eight inches in diameter. I can't say now whether it was a round machine, or octagonal; I think it was an octagonally shaped machine. Also some smaller machines or boxes.

Q. 24. I now show you instruments marked "D," "E," "G," "K," "L," "M," and "O," and ask you whether or not the smaller instruments that you saw at Mr. Drawbaugh's shop between the year 1875 and 1880 resemble these, or any of these, in general appearance.

A. I have seen a quantity of instruments about the size of these, and I think, perhaps, more than there are here, from time to time, at Mr. Drawbaugh's shop. The dates of my visits there are only fixed by the circumstances of my connection with the spindle company. I don't mean to say that I saw all these at one time, but that I saw them from time to time. The date of the only visit that I can fix, is fixed by my connection with the spindles, as I have already testified.

Cross-examined by Mr. Storrow:

Cross-Q 25. On the occasion of your visit with Mr. Free, did you see Mr. Drawbaugh talk into any of these machines, and if so, which one?

A. He may have talked through the machine. I can't remember positively that he did, but think he did. I could not answer which one, not remembering positively that he did. I remember distinctly his showing them to us, and explaining the principles on which they were to act, comparing the film, or thin substance spread over the end of a tin can, as I remember it, to which a wire was attached, or came close to it, the sound to strike that and be conveyed in the same manner that the sound strikes the ear, and that I know took place on that day, because that is one of the points I took notice of. I think I did not take so much account of the test as I did of the principles. I was more interested in the explanation of the principle than I was in the test, and that is the reason I do not remember distinctly of his speaking through it.

Cross-Q. 26. Please tell me everything else you recollect that Mr. Drawbaugh said to you about his talking-machine on that occasion.

A. He spoke about improvements that he thought of making and was experimenting.

Cross-Q. 27. You and Mr. George Free have talked over this visit a little in the last six months or a year, have not you—or talked about it a little to each other?

A. No, sir; not within the last nine months.

Cross-Q. 28. When did you and he last mention it?

A. That I can't tell you. If you can tell me when this litigation first began to be talked about and agitated, then I can tell you. I will give you the substance of the conversation and the circumstances, and you can judge for yourselves. One evening I had gone to our store, where Mr. Free was sitting. He came to meet me, and asked me if I remembered the Sunday that he and I drove into Milltown to get my reaper fixed; and I told him I did, and I asked him why. He refused to tell me, and I told him if it was a secret, he had better not divulge it, and that was the way we quit, and I walked into the store. That is the only conversation I ever had with Mr. Free on the subject.

Cross-Q. 29. Did you tell him then, or any time after, what the date was, according to your recollection?

A. I never told him, that I can remember. I never spoke to him about it, because we very seldom meet.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 2d day of June, 1881.

FRED. M. OTT,
Examiner.

J. A. OYSTER.

Dr. JOHN W. MOFFITT, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I am forty-six years of age; live in Harrisburg, Penna., No. 7 North Market Square, and am a Dentist by profession.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.? If so, how long have you known him?

A. I have known him twenty-five years, at least.

Q. 3. During the past seven or eight years, have you been in the habit of frequently visiting his shop, at Eberly's Mills, or not?

A. I have.

Q. 4. What caused you to go out there frequently?

A. Trout fishing, and the interest I took in the various and numer-

PHONE COMPANY,-1

ous inventions that Daniel Drawbaugh was making and experimenting on.

Q. 5. Did you ever see any talking-machines there, and if so, when did you first see them, to the best of your recollection?

A. I have; and as near as I can recollect, in 1873 first, and from then till now.

Q. 6. Did you at one time purchase an interest in his measuring faucet, and undertake its manufacture? If so, about when was that?

A. I did; as near as I can recollect, November or December, but I am not certain whether it was 1879 or 1880.

Q. 7. Was it the November or December before or after the interference of Drawbaugh against Hauck?

A. It was before. I was already engaged in the business when that interference was in progress.

Q. 8. You testified as a witness in that interference, did you not?

A. I did.

Q. 9. I have in my hand a printed copy of your deposition in said interference, which purports to have been taken on the 25th day of June, 1879. Was it the November or December before that, that you went into business in connection with the faucets?

A. It was.

Q. 10. How long did you continue to own an interest in that faucet manufacturing business?

A. I think about six or eight months.

Q. 11. To whom did you dispose of your interest?

A. To Mr. E. W. Chellis.

Q. 12. At the time when you first saw the talking-machines, about 1873, did you see any of the instruments now on the table before you? If so, please point out which.

A. I did, and saw this one, ["F,"] and this, ["C,"] and this ["B."] Those are all I saw the first time.

Q. 13. Do you remember whether Mr. Drawbaugh talked through the instruments at that time?

A. I can't give any definite time when he talked through any of these instruments, whether it was the first time or a short time after. The first time that he talked through them to me was shortly after I had any knowledge of his having a talking-machine, when he handed me an instrument similar to this [indicating, "A,"] which he directed me to place to my ear, stating that he would go down-stairs or in some other part of the building, and that I should listen. He went, and I heard Mr. Drawbaugh's voice asking me if I heard him talk. "Do you hear me talk?" was the way he put it. I was surprised and looked around, expecting to find Mr. Drawbaugh behind me, but did not find him. He came in presently and attempted to explain to me the principle on which the machine operated. I did not understand his explanation. He alluded to the vibration of a bee's wing to illustrate how the diaphragm operated to produce the sound. That is about all that I remember distinctly on that occasion. There was a great deal more said that I do not remember.

Q. 14. About how long do you think that was after he showed you the machines "B," "F," and "C"?

A. As I visited Mr. Drawbaugh's shop frequently, some weeks two or three times, I cannot state positively whether it was two days or two weeks thereafter. But I am positive that it could not have been one month thereafter.

Q. 15. From that time down to the time when you went into the faucet business with him, did you, from time to time, see other talking-machines in his shop?

A. I did.

Q. 16. Please look at the machines "D" and "E," now shown you, and state whether or not you recollect seeing them, or either of them, in his shop, and if so, give us your best recollection as to the time when you first saw them.

A. I did see an instrument of this kind, shape, or style. This one ["D"] looks like the one I saw. I cannot state positively the time, because I took so little interest in the machine that I only gave it a passing notice. I should have said, instead of the machine, the whole talking-machine business,—I took very little interest in it. I will sum the whole matter up in this way, in regard to seeing the different instruments. That I recognize nearly all the instruments on the table as those I saw in Mr. Drawbaugh's shop, from time to time, as I would be there, but cannot give any definite date as regards any of them, except the first three, and that is not very definite.

[*The examiner certifies that the instruments on the table at the time of the witness' answer are "A," "B," "C," "D," "E," "F," "G," "H," "I," "J," "K," "L," "M," "N," and "O."*]

[*The witness, after looking over the machines, continues:*]

I am not certain about having seen the instrument marked "J." I may have confounded that with the one that has the bell on, ["H,"] which I know I saw.

Q. 17. As you would be at his shop from time to time, from the time when you first saw the three talking-machines, "B," "F," and "C," down to the time when you were in the faucet business, would you, from time to time, see talking-machines or instruments that you had not seen at previous visits?

A. Yes, sir; I suppose so, because Mr. Drawbaugh would have something to say to me about his improvements and his talking-machine, and I remember that he showed me different forms of curved iron or steel on pieces of wood turned up, resembling this [holding up "D."] and also showed me one that he had improved what he had called the diaphragm, stating that he was making it of heavy metal, and showed me the machines from time to time with these improvements.

Q. 18. How heavy were the heaviest diaphragms that he showed you at any time or times?

A. I should say, at least ¼ of an inch, and of metal.

Q. 19. Did you ever hear him talk through the machines that had the heavy diaphragms?

A. No, sir.

Q. 20. Was Mr. Drawbaugh doing any work on his talking-machines during the time when you were connected with the faucet business?

A. Yes, sir; our trouble was to keep him away from it.

Q. 21. Were you at his shop frequently when the Electric Clock Company of Messrs. Shettel & Grissinger were manufacturing Electric Clocks there?

A. Yes, sir.

Q. 22. Did you see him doing any work on his talking-machines at any time or times while said Clock Company were carrying on their business there?

A. Yes, sir; but what particular part of the machines I could not say. I saw a machine—I think he called it a transmitter—made in the shape of a funnel, of paper, with threads passing through from one wall to another. That was while the clock company was in operation, and was one of the last things I saw him working on that I can describe.

The reason I remember that is, that he wanted me to go in with him to get it patented and get it into use.

Q. 23. When did Mr. Drawbaugh first ask you to go in with him and furnish means for getting the talking-machine patented and introduced into use; and if he asked you more than once, how often after the first time did he ask you to do so?

A. Considerable time before I went into the faucet business he asked me to go into the talking-machine. It was before the Centennial year, and on nearly every occasion we would meet, he would try to induce me to go in, and ask me if I had not enough money, to try and get some other person to go in with him.

Q. 24. Why did you finally decide to go into the faucet, rather than the talking-machine?

A. Because I understood the faucet business better than the talking-machine, and having asked Mr. Cheilis what he thought of the talking-machine as a speculative enterprise, he discouraged it, and encouraged the faucet business, because, as he stated, there was more prospect of making money out of it—the faucet—in a short time than out of the talking-machine.

Q. 25. When Mr. Drawbaugh first asked you to go into the talking-machine with him, had you heard it talk, and did you know that it would operate as he claimed for it?

A. I heard it talk, but, up to the time that I went into the faucet business, looked upon it more as a toy, or matter of amusement, than an instrument of any utility.

Q. 26. Did not you, during those years, think there was any money to be made out of invention by which a person could talk from one place to another, instead of telegraphing?

A. I did, towards or during the latter part of the time; but, I suppose, from my knowledge of telegraphing, that I did not put the telephone, or talking-machine, in its stead. In other words, it never occurred to me that the thing would ever amount to anything as a telegraph. At an early stage of the proceedings, I had seen at Mr. Drawbaugh's shop a dial telegraph, with letters around the dial, to spell out the words. This was to be worked entirely with magnets, without a battery. This was one of the things that made me think that the talking-machine would not amount to much as a speculation.

Q. 27. When did Mr. Drawbaugh invent the faucet that you became interested in?

A. As near as I can remember, in the year 1869 or 1870. In one of those years; the exact time I cannot remember.

Cross examined by Mr. Storrow:

Cross-Q 28. How long before you went into the faucet business did you have the conversation with Mr. Chellis about the relative merits of the talking machine and faucet?

A. As near as I can remember, a month or two.

Cross-Q. 29. Your conversation must have been somewhere in the fall of 1878, I suppose?

A. I think so.

Cross-Q. 30. Did he tell you why he thought there was more prospect, &c., as you have stated?

A. Yes, sir; I remember that one of the leading points he stated was that the telephone was already in use, and that Dan would have a hard time to establish his claim on it, and that there would be more money in the faucet than in the telephone business. His meaning was that Drawbaugh would have to establish priority of invention, &c.

Cross-Q. 31. Did you and Mr. Chellis go into this faucet business as partners together, and at the same time?

A. Yes, sir; with Mr. Drawbaugh, one third interest each.

Cross-Q. 32. Did you ever have one of Drawbaugh's electric clocks?

A. I had one in my house.

Cross-Q. 33. When?

A. I lived on Market street at the time. It was while the clock company was in operation. I think it was in 1878.

Cross-Q. 34. Did it ever trouble you by stopping and not keeping good time?

A. No, sir.

Cross-Q. 35. Did it always keep good time and not stop?

A. No, sir; it did not always keep good time.

Cross-Q. 36. Did it always keep going?

A. Yes, sir.

Cross-Q. 37. Did you ever make any complaint about it to the company or to Mr. Drawbaugh?

A. Yes, sir; I did.

Cross-Q. 38. Did you ever complain of it more than once?

[*Mr. Hill says, that not being able to see what this line of cross-examina-*

tion has to do with talking machines, he objects to it as immaterial and irrelevant.]

A. I don't remember. I remember of one time.

Cross-Q. 39. Whom did you buy it of?

A. No one.

Cross-Q. 40. Do you mean that you only borrowed it?

A. Neither one. I did not own it, nor I did not buy it, nor I did not borrow it.

Cross Q. 41. How did it come into your possession?

A. It was put there by the Company with my permission.

Cross-Q. 42. Did you tell them that they must come and make it go better, or come and take it away?

A. I don't remember. I wrote to one of the Company—not to Drawbaugh—that if the clock did not run better, they must take it away.

Cross-Q. 43. Did Drawbaugh or any of the Company come over to see you, in consequence of that complaint?

A. Mr. Shettel came to see me.

Cross-Q. 44. Did not Mr. Drawbaugh come, too?

A. Mr. Drawbaugh did not come at that time.

Cross-Q. 45. Did he come alone to see you about it, on a different day?

A. He came alone one time. I don't remember whether it was at that time, or on that call, or not.

Cross-Q. 46. Please look at your fourth answer, and tell me what are the inventions there referred to.

A. Various inventions. I could not state which ones. I was interested in almost any mechanical pursuit the man was working at, being inclined that way myself, to some extent.

[*Mr. Hill renews his objection to the cross-examination about the clock.*]

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 2d day of June, 1881.

FRED. M. OTT,
Examiner.

JOHN W. MOFFITT.

Adjourned until June 3d, 1881, at 10 o'clock, A. M.

Friday, June 3, 1881, 10 *o'clock*, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

Recess for dinner until 1.30, P. M.

1.30, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

CHARLES L. DRAWBAUGH, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Twenty-six; residence, Todd, Huntingdon county, Penna.; occupation, lumber business.

Q. 2. Are you a son of Henry F. Drawbaugh, who testified a few days ago in this cause?

A. Yes, sir.

Q. 3. How long have you lived at Todd, and how far is it from Eberly's Mills?

A. I have been there one week next Monday.

Q. 4. Where did you live just before that?

A. At Three Springs, Huntingdon county.

Q. 5. How far is Three Springs from Eberly's Mills?

A. About one hundred and eight miles, and Todd is one hundred and eighteen miles from Harrisburg.

Q. 6. How long did you live at Three Springs?

A. I moved to Three Springs about the last of January, 1881.

Q. 7. Where did you live before that?

A. At Newville, Cumberland county, in the same town with my father, but not in his family since April, 1878. Before that time, I lived in my father's family. Newville is twenty-eight miles from Eberly's Mills.

Q. 8. Your father testified that he commenced running a line of market cars on the railroad, about May 1, 1876, and run them until the summer of 1878. Were you employed on that line of cars while he run them?

A. Yes, sir.

Q. 9. Prior to that time, had you ever heard your uncle, Daniel Drawbaugh, say anything to you about his talking-machines? If so, how long before you commenced running the cars did you first hear him say anything about them, and what did he say, to the best of your recollection, the first time?

A. Yes, sir; to the best of my recollection, it may have been a year, and it may have been three or four years before we commenced running the cars. I can't just recollect. I understood him to say that he had a machine to talk to a distance. I understood that it was to work pretty much like telegraphing. I can't recollect that he showed me the machines at that time.

Q. 10. When do you recollect first seeing his talking-machine, and who showed it to you?

A. It was some time before we commenced running cars. I can't tell exactly how long. It may have been a year, and it may have been two or three years. It was shown to me by my cousin, Harman K. Drawbaugh, at my uncle's shop.

Q. 11. Did Harman talk through the machine to you at that time?

A. Yes, sir.

Q. 12. Explain what floors you and Harman were on while he was talking and you were listening to the machine.

A. I was on the first floor, and he was above me somewheres, but I don't recollect just exactly where he was; he was on a floor above.

Q. 13. Did you hear and understand through the machine what was said?

A. Yes, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 14. Were you ever at your uncle's shop on any other occasion?

A. Yes, sir; I was there quite a number of times; I could not say how often.

Re-direct by Mr. Hill:

Q. Q. 15. How many times do you think you were there during the three years before you commenced running the cars?

A. I may have been there three or four times, or I may have been there more; I can't tell exactly. I may not have been there that many times.

Q. Q. 16. How many times were you there during the two years and a quarter that you were running the cars?

A. I was there three or four times, and may be oftener; I can't tell.

Q. Q. 17. How many times have you been there since you stopped running the cars?

A. I think it was but once, if I recollect right. I think it was about January, 1880.

Q. Q. 18. Did you ever hear your uncle say anything more about talking-machines after that first conversation?

A. I think the last time that I was down at his place he was talking about it. I can't recollect what it was that he said. I can't recollect whether or not I heard him say anything about it between the first conversation and the one last mentioned. I never took much interest in it.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 3d day of June, 1881.
FRED. M. OTT,
Examiner.

C. L. DRAWBAUGH.

Adjourned by consent of both parties until Monday, June 27th, at two o'clock, P. M.

Monday, June 27, 1881, 2 *o'clock,* P. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

DANIEL C. JONES, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Age, thirty-one; residence, 110 Buttonwood avenue, Harrisburg; occupation, clerking for Mr. Knisely, in the hat business.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.? If so, how long have you known him?

A. I do; I got acquainted with him in 1870.

Q. 3. Did you at one time live at or near Milltown, or Eberly's Mills, Cumberland county, Penna.? If so, when did you commence to live there, and to what time did you continue to live there?

A. I moved there in the spring of 1870, and left in the spring of 1871.

Q. 4. During the time that you lived there, were you ever in Daniel Drawbaugh's shop? If so, how often?

A. I was there a great many times; I can't tell the exact amount of times.

Q. 5. Have you ever been in that shop since you moved away from Milltown, in 1871?

A. No, sir.

Q. 6. When you were in that shop, during the time when you lived there, did you see any talking-machine, or talking-machines, there?

A. I saw a machine there. I was told it was a talking-machine.

Q. 7. State how you came to see it there, and what was said about it at the time.

A. I had been looking around the shop and seen something that resembled this very much, [indicating "B,"] and I asked what it was Harman Drawbaugh told me it was a talking-machine.

Q. 8. Did you talk through it, or hear anybody talk through it?

A. No, sir; I did not.

Cross-examined by Mr. Storrow:

Cross-Q. 9. Whose house did you live in?

A. Mr. Martin Best's; my father farmed Mr. Best's farm one year.

Cross-Q. 10. Who run the grist-mill while you were there?

A. Mr. Leonard.

Cross-Q. 11. Who had the blacksmith-shop then?

A. Mr. Fettrow.

Cross-Q. 12. Who kept the store?

A. Mr. Kissinger.

Cross-Q. 13. Who had the post-office?

A. Mr. Kissinger; the post-office was in the store.

Cross-Q. 14. Where did you go when you left there?

A. From there we moved to York county, back of Lewisberry.

Cross-Q. 15. How long did you live in Lewisberry?

A. We moved there April 1st, and left the first of the following March.

Cross-Q. 16. How far is it from Lewisberry to Newberry?

A. I can't tell you that distance.

Re-direct by Mr. Hill:

Q. Q. 17. State whether or not Harman Drawbaugh had recently returned from the West at the time when you saw the machine which he told you was a talking-machine.

A. He had returned some time before that. It might have been about two months, as near as I can tell.

Re-cross by Mr. Storrow:

Re-cross-Q. 18. What work was going on at Mr. Drawbaugh's shop at the time you refer to?

A. There was no one working in his shop, that I recollect of, except himself.

Re-cross-Q. 19. What house did he live in at that time?

A. He lived in what we called the corner house, a kind of a double house, next to the blacksmith shop. He and Fettrow lived in the same house.

Re-cross-Q. 20. Did you ever talk with anybody, outside of Drawbaugh's shop, about the talking-machine, or did you ever mention it to anybody while you lived there?

A. I don't remember of ever hearing anything outside, nor of ever mentioning it to anybody.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 27th day of June, 1881.
FRED. M. OTT,
Examiner.

DAN'L C. JONES.

Adjourned until June 28th, at 10 o'clock, A. M.

June 28th, 1881, 10, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

DAVID H. GOOD, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is forty one years; residence, Yocumtown, York county, Pa.; occupation, merchant. I am acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa. I learned to know him in 1867.

Q. 1. How long have you lived at Yocumtown?

A. I moved there in the fall of 1870.

Q. 2. Before you moved there, where were you doing business and residing for several years?

A. At Eberly's Mills.

Q. 3. From what time to what time did you reside at Eberly's Mills?

A. From the spring of 1867 to the fall of 1870 I resided there, and did business there as a merchant.

Q. 4. While you resided there, did you at any time have any conversation with Daniel Drawbaugh with reference to his talking-machine? If so, what was the conversation, and when was it?

A. No, not individually, but heard some. In the fall of 1868 I heard him tell two men in my presence that he had a machine that he could convey sound or talk as plain as he was talking now. Then he went on, of course, with a great rigamarole, that he had experimented. He did not just say what distance, but that he could talk at a distance, or hear.

Q. 5. What kind of a store did you keep at Eberly's Mills, while you lived there?

A. What is called a general store. Everything to suit farmers, outside of farming implements.

Q. 6 Did Mr. Drawbaugh or his family trade at your store?

A. Yes, sir; they were regular customers.

Q. 7. So far as you had any knowledge, what was his financial condition during that time?

A. Very limited. His means were very limited.

Q. 8. Did you have any difficulty in collecting accounts from him?

A. Yes, sir.

Q. 9. When you gave up business there and moved away, had he settled and paid you in full, or did you leave him still owing you?

A. I left him still owing me. I took his note for balance due, amounting to sixty-four dollars.

Q. 10. How long was it before you collected the note?

A. The last payment, I think, was made in 1873. He paid it in different installments.

Q. 11. Did you finally get a judgment on the balance due on the note?

A. Yes, sir.

Q. 12. What was Drawbaugh's general reputation, in the community there, for honesty?

A. It was good.

Cross-examined by Mr. Storrow:

Cross-Q. 13. Did this conversation, that you have spoken of, take place in your store?

A. Yes, sir.

Cross-Q. 14. Who were the two men?

A. Mr. Hart and Mr. Dittlow, if my memory serves me right. I would not be positive as to Mr. Dittlow.

Cross-Q. 15. When you heard him say that he had got a machine that would do what you have stated he said it would do, I suppose you believed, right off, that he had got such a machine, and that it would do it, did not you?

A. I had every reason to believe it.

Cross-Q. 16. What do you mean by "every reason?"

A. I never knowed him to say anything of the kind but what he brought to perfection, in the way of machinery and invention.

Cross-Q. 17. Did not it strike you as rather a startling kind of machine, if it could do what he said it could do?

A. Yes, sir.

Cross-Q. 18. And, notwithstanding that, you were ready to believe, right off, that he had invented and made such a machine, just because you heard him say so to two men in your store; is that so?

A. Yes, sir.

Cross-Q. 19. Do you think that the most of people who knew him in that community were disposed to accept his remarks about his own inventions with the same confidence?

A. To a great extent.

Cross-Q. 20. I wish you would tell me everything else you know personally, or that you have ever heard him say, about any talking-machine.

A. He said he could greatly improve it from what he had. I never heard anything afterwards, I believe.

Cross-Q. 21. Was this remark in your last answer made on the same occasion that you have already testified about?

A. Yes, sir.

Cross-Q. 22. Was he looked upon, by you and others, as a man who could invent most anything?

A. He was.

Cross-Q. 23. What other things did he ever invent?

A. A stave-cutter, faucet, clock, and some other arrangements that I don't know the name of. I saw the patterns, but I don't know the name of them.

Cross-Q. 24. Where did you see the patterns?

A. At his shop.

Cross-Q. 25. He had quite a garret-full, at his shop, of models and patterns, and things that he had made and experimented with, did not he?

A. Yes, sir.

Cross-Q. 26. Who took the store when you left?

A. No one, that fall.

Cross-Q. 27. Did you move away your stock, or sell it out?

A. I moved my stock.

Re-direct by Mr. Hill:

Q. Q. 28. Do you remember who kept store there next, after you left?

A. Kissinger.

Re-cross by Mr. Storrow:

Re-cross-Q. 29 Please to tell me the names of the householders at Eberly's Mills, while you kept store there.

A. Christian Eberly, John Beetem, John W. Drawbaugh, Daniel Drawbaugh, George B. Heck, William Heck. That is all I can recollect in the town. Most of the houses were owned by the company there, Beetem & Eberly.

Re-cross-Q. 30. Who was the blacksmith at that time?

A. Daniel Fettrow.

Re-cross-Q. 31. Who was the postmaster?

A. George B. Heck.

Re-cross-Q. 32. Who carried the mail?

A. David H. Good.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 28th day of June, 1881.

FRED. M. OTT,
Examiner.

DAVID H. GOOD.

Adjourned until 2, P. M.

2 *o'clock*, P. M.

Mr. Storrow only appeared, and at three o'clock, the counsel for the respondents not appearing, or not producing any witnesses, examination adjourned until the 29th instant, at 10, A. M.

June 29, 1881.

Examination resumed, pursuant to adjournment, at 10.20 o'clock, A. M.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

[*Mr. Hill states, in explanation of the delay yesterday afternoon, that it was caused by the non-attendance of witnesses, who had been sent for and were expected to be here.*]

D. E. BYERS, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is twenty-seven; I reside in Newville, Cumberland county, Pa.; occupation, railroad agent and telegraph operator.

Q. 1. Do you know Henry F. Drawbaugh, of Newville, Cumberland county, Pa.? If so, how long have you known him?

A. I have known him ever since I can remember anything. I suppose twenty years.

Q. 2. How long have you been engaged in the business in which you are now employed—telegraph operating?

A. Since 1869.

Q. 3. Have you any recollection of Henry F. Drawbaugh asking your opinion, a good many years ago, of a talking-machine, which he told you his brother had invented?

A. Yes, sir.

Q. 4. To the best of your recollection, about how long ago would you say that conversation occurred?

A. I would say, to the best of my recollection, it would be six or eight years. I can't get at it any nearer than that.

Q. 5 Was it, or was it not, several years before you ever heard or read of the invention or introduction of electric telephones?

A. Yes, sir.

Q. 6. When Mr. Henry F. Drawbaugh spoke about it to you, as you have testified, did you encourage, or discourage, him about it?

A. My recollection is that I discouraged him.

[*Mr. Hill here reads over question and answer* 111, *in the deposition of Henry F. Drawbaugh, printed on page* 411 *of* "*Defendants' Record,*" *and asks the witness:*]

Q. 7. What is your recollection of the conversation with Henry F. Drawbaugh, and how far does it agree, or disagree with the testimony that I have just read to you?

[*Counsel for complainants objects to the reading of the testimony before it is read, and to the question as leading and incompetent.*]

A. It might have been that that is the conversation that took place. It has been so long ago that I don't remember the exact words, but remember of laughing at the idea of such an invention.

Cross-examination waived by Mr. Storrow.

D. E. BYERS.

Recess until 11.30, A. M.

June 29, 12, M.

Examination resumed.

GEORGE BRICKER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is sixty-two; residence, Newville, Cumberland county, Pa.; occupation, none at present. I am acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa., and have known him for twenty-five or thirty years.

Q. 1. If you ever had any knowledge of his working upon a talking-machine, please give us a full statement of all the knowledge that you had about it, together with the dates, as near as you can fix them.

A. The first knowledge I had of it was during the fall of 1870. My information I got here in Harrisburg, from Mr. Winters, on South Second street, (liquor merchant, I think he is,) and Mr. Brandt, who was a drygoods merchant in the square. Mr. Drawbaugh, not Daniel, but some relation, father-in-law of Mr. Brandt, was also present. The three were together. That was my first intimation—through those parties—of Mr. Daniel Drawbaugh working upon this machine. I don't remember what they called it. The purpose for which it was intended was to convey sound to a distance. My recollection is indistinct as to whether it was the sound of the voice, but is distinct as to its conveying sound by electricity, if he had a mind to. Through this information, at the time, before I left the place here to go to my home, I went out to his place of residence to see it. When I went there I found he was away, and I did not see it. After that I met him again at a time that I fix as some time during the year 1870 or 1871, and had a conversation with, or rather I asked him the question, when I met him, and told him about my being there. I then asked him how he got along with his machine that he was working on. I mean this machine that we speak of. He said the trouble with him not making more progress was owing to his not having any money to go on and complete it as fast as he would like to, and having no one to assist. He told me that outside people looked upon or considered him crazy, or something like that, and were not willing to assist him with money to complete his invention. That is the last that I recollect of meeting him, and having any conversation with regard to this machine.

Cross-examined by Mr. Storrow:

Cross-Q. 2. Was he working upon other machines, and getting up and experimenting upon other inventions?

[*Objected to, and the magistrate is requested to instruct the witness to answer from his own knowledge, and not from hearsay.*]

A. I don't know that he was.

Cross-Q. 3. Did not you understand that he was?

[*Objected to as above.*]

A. I have no knowledge that he was working upon any other machine, or any other machines, that he had patented, or intended to.

Cross-Q. 4. Did not you understand that he was working upon other machines?

[*Objected to as hearsay, and as immaterial and incompetent.*]

A. I did not. He never told me that he was, and I have no knowledge of his working on any. He might have been, but he never told me.

Cross-Q. 5. Did not you hear that he was, and did not you believe that he was, working upon other machines and inventions?

[*Same objections.*]

A. I never heard and never thought that he was. I had no knowledge that he was. He might have been, but I have no knowledge of it.

Cross-Q. 6. Do you mean to say that you knew Daniel Drawbaugh twenty-five or thirty years, and never heard, or never thought, that he was working on any machines or inventions, except the alleged machines you spoke of in your direct examination?

[*Objected to as assuming that the witness's testimony covered a period of twenty-five or thirty years, whereas, on the contrary, the witness expressly stated that it covered only the years* 1870 *and* 1871, *and, so far as the cross-examination goes, outside of those two years, it is further objected to as irrelevant to the subject-matter of the direct examination.*]

A. I will answer it in this way—that I should not have known about this, had not my attention been drawn to it in this way by these men.

Cross-Q. 7. Is that the best answer you can give?

[*Same objections.*]

A. That is the best one I can give.

Cross-Q. 8. In your direct testimony, you say: "I then asked him how he got along with his machine that he was working on." After saying that, you added: "That is not definite, because he was working on a good many machines," did you not?

A. I don't have any knowledge of saying that he was working on a good many machines.

Cross-Q. 9. Did you not say that he was working on other machines?

A. No; any time he was talking to me, it was about this one machine that these men got me to go out to see, and when I talked to him about how he was getting along, I had only reference to this particular one.

Cross-Q. 10. So you mean to leave it, that, during all the years you knew him, you never heard of him working on any machine, except this alleged machine, do you?

[*Same objection as to cross-question* 6.]

A. Yes, sir.

Cross-Q. 11. You never saw this alleged machine to convey sound, did you?

A. I did not.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 29th day of June, 1881.
FRED. M. OTT,
Examiner.

GEO. BRICKER, SR.

Recess for dinner until 2, P. M.

June 29 2.30 *o'clock*, P. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

HENRY SNYDER, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is sixty years; I am a grain and commission merchant. I have lived for a year past at Jacksonville, about four miles from Newville, Cumberland county, Pa.; that is, I am doing business there, but have not moved my family yet.

Q. 1. Do you know Henry F. Drawbaugh, of Newville.

A. I do.

Q. 2–3. State whether or not Henry F. Drawbaugh ever applied to you to go in and furnish money for patenting and introducing upon the market a talking-machine, invented by his brother Daniel; if so, tell us all about the matter—what was said and done, and when.

A. He did. I can't fix the date as 1872, '3, or '4, exactly. I think it was in the year 1872 or 1873, that Harry F. Drawbaugh came to my place of business in Newville and asked me if I would not go into an enterprise with his brother Daniel, or furnish him money, in a project or enterprise that was an entirely new thing—perhaps never heard of; that it was a machine, as he called it, for talking. I asked Harry, Dan's brother, what the object or intent of it was. Harry said that it was intended to establish a patent, what he believed, on the talking-machine, and that it required a good deal of money to procure different kinds of machinery, as well as his own labor and time connected with it, and that he himself was too poor to carry the project or enterprise to a successful issue, or something equivalent. That may have been all that occurred between Harry and I at that time. He may have come to me as often as a half a dozen different times, and still insisted that I should go in with Dan and furnish him the money; that he was too poor to carry it on much longer himself. I asked Harry why he would not try and get a man of mechanical genius that could assist him, that I could be of no advantage to him, only in the money matter. Harry assured me that it was nothing but the money alone that was wanting. That he had within himself all the knowledge that was requisite to establish the talking-machine he intended to put into use; and that, unless he could obtain a patent, all his time and labor would be spent or lost in vain. I, however, declined giving them any assistance, having no knowledge or idea of what he intended to establish or accomplish, and upon these facts I based my objections.

Q. 4. Do you mean to be understood that Harry came to you different times, perhaps a half dozen times, about this matter?

A. I expressed it so; that is what I meant.

Q. 5. The first time that he came to you, you say was in 1872, '3, or '4. About what year would you fix as the last time Harry spoke to you on the subject?

A. Not later than 1875. My intercourse and acquaintance with the Drawbaugh family has been so common and familiar that I could not state the time as positive as I might have done with a stranger.

Q. 6. When Harry was urging you to go in with his brother in this enterprise, did he tell you that the machine had been made to operate, so as to talk from one place to another, or not?

[*Objected to as hearsay.*]

A. At every interview, after the first, Harry still told me that the facts of his machine was becoming more evident every time that he saw or talked with his brother Dan. I mean, that he considered that he was still meeting with more and more success in it, and he said that, from the first to the last, it would prove a full and successful talking-machine, and that his only drawback was the want of funds to bring it before the public.

Q. 7. Am I to understand that the proposition that he urged upon you, from time to time, included the patenting of the machine and the manufacture of it, and its introduction upon the market?

A. Yes; that was the understanding, that all the expenses incumbent upon the patenting, manufacturing, and all other machineries was to be included in the bill of expenses, to bring it before the public, or to put it into use. By all other machineries, I mean machinery for manufacturing it, or models, or anything of that kind.

Q. 8. What was offered to you as a consideration for putting the money into it?

A. The half interest.

Q. 9. Did you study over the matter and make up in your own mind an estimate of the money that would be required to get a patent and introduce the patent into public use?

A. I did, but only within myself.

Q. 10. If you remember what your estimate was, please state it.

A. My estimate was not less than five thousand dollars, and not more than ten thousand.

Q. 11. Did you have knowledge at that time that Mr. Daniel Drawbaugh, who would be your partner in the business if you went in, was quite heavily indebted and financially involved?

[*Objected to as leading and assuming.*]

A. I knew nothing of his indebtedness, but knew he was born of poor parentage, or rather poor, I would say. I knew nothing about his means, except what his brother told me.

Q. 12. Did Harry tell you at the time that Daniel was in debt?

[*Same objection.*]

A. He did not, but it was so evident upon my mind that I knew it was the fact.

[*Answer objected to for the same reason.*]

Q. 13. From what you know of his brother's circumstances, you were satisfied that it was the fact, although you did not actually know; is that what you mean?

[*Objected to as leading, as assuming, and as incompetent in view of the previous testimony of the witness.*]

A. Yes, sir.

Q. 14. Did that fact, or what you believed to be the fact, have any share of influence in leading you to decline the proposition to go in with him in the proposed enterprise?

[*Same objection.*]

A. It had, because I did not believe that he had one dollar to give towards the expenses in getting the machine completed.

Cross-examined by Mr. Storrow:

Cross-Q. 15. I understand that the proposition made to you was that you should furnish all the money, and in pay for that, should take the half interest; is that so?

A. Yes, that was my understanding.

Examination taken, reduced to
writing, and by the witness sworn
and subscribed to before me, this
29th day of June, 1881.
FRED. M. OTT,
Examiner.

HENRY SNYDER.

Adjourned at 3.45, P. M., until 10, A. M., June 30th.

June 30th, 10.30, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

DAVID K. ERNST, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is about thirty-three; my post-office address is Newville, Cumberland county, Pa.; I don't live quite at Newville; my occupation is farmer. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa. I have known him ever since I know anybody. I was raised in the town where he lives.

Q. 1. How long have you lived at Newville, and how far is it from Eberly's Mills, or Milltown?

A. I live at the same place I live now for almost fourteen years. It is about twenty-six miles from Eberly's Mills, to drive it, and it is a little farther by rail, as we live a little this side of Newville, and go there to get off.

Q. 2. Do you recollect the circumstance of your visiting Daniel Drawbaugh's shop, at Eberly's Mills, some years ago, for the purpose of purchasing a pump?

A. I do; yes, sir.

Q. 3. Who went with you on that visit?

A. Mr. John Bloser, the gentleman who is here present.

Q. 4. State when that visit occurred—that is, what year, and what time of the year, as near as you can fix it.

A. The year was 1872. It was in the beginning of haymaking, before the grain was cut. I think it was about the middle of June. They were just commencing to cut hay. The way I fix the year is, that I wanted some one to come with me to the lower end of the county, as we call it, and I asked Mr. Bloser to come with me, and he told me he had hardly time; he would have to haul sand and lime, and tend the plasterer, who was intending to plaster his father's house then, or shortly. I told him to come along with me and I would help him haul the sand and lime when we came back. We did so, and we hauled it just at the beginning of grain-cutting; and by different reasons we know that the house was plastered in 1872. There had been an end built to the house, and the old part remodeled in that year. The work was begun in the fall of 1871, and completed in the summer of 1872.

Q. 5. While you were at Mr. Drawbaugh's shop on that occasion, was anything said, or done, about a talking-machine? If so, what?

A. Yes, sir; there was. Mr. Drawbaugh spoke to me about his talking-machine. I asked him, when we went there, to show us his things—machinery—and he showed us quite a number of things. Among them was a dial telegraph, which we operated a little on. I thought it a very nice machine. I asked him why he did not go on and finish that. I thought there was money in it. Oh, he said he was working at something better, which he called a talking-machine. I could not say positive that he showed us the machine, although I rather think he did. I saw some of the pieces this morning in Mr. Jacobs' office, and they looked natural to me, but I could not positively identify them. The ones that I refer to as seen this morning were a glass tumbler and a green tin can.

Cross-examined by Mr. Storrow:

Cross-Q. 6. Did you buy a pump from Mr. Drawbaugh on that visit?

A. I would answer that by saying I did not get the pump at that time. I gave him the length of the pipe, and my brother-in-law brought it up afterwards.

Cross-Q. 7. Why did you happen to go to Drawbaugh's shop to buy a pump?

A. Mr. Drawbaugh owed my father an account, and we thought the pump would be paid on that account.

Cross-Q. 8. Did he make these pumps?

A. He patented them. I could not say who made them. I can't say what name they were known by at all.

Cross-Q. 9. Who did you hear of these pumps from?

A. The way I would answer that question, would take a little longer time to answer it, is this: There was an uncle of mine, George Shettel, from Shepherdstown, bought a pump of Drawbaugh—a patent pump. We intended to get one of that kind, and he told us this kind was better and cheaper. Dan Drawbaugh told us this. I think they called it an air pump, or something. I mean that is the kind Shettel had.

Re-direct by Mr. Hill:

Q. Q. 10. In your eighth cross-answer, you say "he patented them." Do you know this to be a fact, or is it only your understanding?

A. It is my only understanding by parties telling me, who worked in the shop.

Examination taken, reduced
writing, and by the witness sworn
and subscribed to before me, this
30th day of June, 1881.
FRED. M. OTT,
Examiner.

D. K. ERNST.

JOHN BLOSER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is thirty-three; I live in West Pennsboro' township, Cumberland county, Pa.; my post-office address is Newville; my occupation is that of a carpenter.

Q. 1. You have been present, and heard the testimony just given by Mr. Ernst, have you not?

A. I have.

Q. 2. Do you remember the trip to Daniel Drawbaugh's shop, about which he testified?

A. I do.

Q. 3. State whether, or not, the account which Mr. Ernst has given of that trip, and of what occurred at Mr. Drawbaugh's shop, substantially coincides with your recollection?

A. I don't remember quite as much as he has said. I remember going there. I don't know that I can say anything about what occurred in the shop. I remember being in there, and saw quite a number of things there. The impression on my memory is, that he, Drawbaugh, spoke about the talking-machine.

Q. 4. In what year was that trip, and at what time of the year, and how do you fix the time?

A. My recollection is, that it was in 1872, about the middle of June. He spoke about the building that was going on. I think the circumstances would be almost the same as those mentioned by Mr. Ernst. I was in school the summer of 1871, before harvest. The plastering of the house was done about the time that Mr. Ernst states. I was teaching school in the fall and winter of 1871, and finished in the spring of 1872; the house was finished and ready for plastering in the spring of 1872. I

LEPHONE COMPANY,-1

remember seeing some grass being cut as we were on our way home from our trip.

Cross-examination waived by Mr. Storrow.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to, this 30th day of June, 1881.

FRED. M. OTT,
Examiner.

JOHN BLOSER.

11.45, A. M., June 30th, no more witnesses being at hand, adjourned until 2.30, P. M.

June 30th, 2.40, P. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

JAMES A. SMITH, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

I am fifty-four years old; I reside at New Cumberland, Cumberland county, Pa.; I am Postmaster.

Q. 1–2. Did you formerly live at Milltown, Cumberland county, Pa.?

A. Yes, sir.

Q. 3. When did you commence to live there?

A. I moved there on the 18th or 19th of March, 1866.

Q. 4. How long did you live there?

A. I am not positive whether it was in the fall—it was late in the fall, I think, of 1867, when I moved away.

Q. 5. What was your business at Milltown?

A. I was miller there; I ran the mill.

Q. 6. While you lived there, did you know Daniel Drawbaugh, of Eberly's Mills?

A. I did.

Q. 7. Will you please to relate a conversation, that you had with Daniel Drawbaugh, at your mill, while you lived there, on the subject of the telegraph?

A. Early in the spring of 1867 Daniel Drawbaugh came into the mill office and had in his hand a copy of the *Scientific American*, on which there was small black spaces, I could not tell exactly the size, represented as streaks or rays of light striking out from a centre. We began—I don't know how the conversation began—talking about electricity. I thought this was something on electricity. From this we began to talk about the telegraph—led into a conversation about the telegraph, and Mr. Drawbaugh remarked that the telegraph would be yet superseded, and men would talk audibly as face to face at any distance, saying at the same time that he was experimenting. I asked him at the time if he thought so, when he remarked: "I am confident of it." I don't remember of any other conversation until within three days of that time—it might have been the next day—in his shop, when he told me that he and his daughter—I forget her name—but he says Emmy, had talked together, and that there was a floor and two partitions between them. At this time he did not tell me by what means they had conversed, but it made the impression on my mind that it was by a wire, but he did not say that. I don't know what made the impression, but that was the impression on my mind, that it was a wire. The daughter, to whom Mr. Drawbaugh referred, is now dead. I do not remember her name, but it was his oldest daughter.

Q. 8. Did Mr. Drawbaugh ever show you one of his talking-machines?

A. No, sir; he told me one time to come and see it, that he had it all right now, but I had not time, and did not go.

Cross-examined by Mr. Storrow:

Cross-Q. 9. Have you ever been at Drawbaugh's shop since you moved away from Eberly's Mills?

A. Yes, sir; I have. I think I have been there twice.

Cross-Q. 10. Were those visits soon after you moved away, or recently?

A. The first time was soon after he had got to making faucets in the old mill, where he is now. I can't tell you when the second time was. I suppose he was in the old mill three or four or more years when I made that visit. I can't give you any idea of that; it may have been more, and it may have been less.

Cross-Q. 11. Then the talk with him, which you have testified about, was when he had a shop by the grist mill, and before he had moved down to the old mill where they made the faucets, was not it?

LEPHONE COMPANY,-1

A. Yes, sir: that was the first two conversations, and the conversation when he told me that he had the machine all right, was after he had moved down to the lower shop where he made the faucets?

Re-direct by Mr. Hill:

Q. Q. 12. Was this last conversation, when he told you he had the thing all right, at the last time you visited the shop?

A. Yes, sir; at the last time I visited the shop. In the first conversation at the other shop, I should have also stated that he said, "Hang it," if he only could get somebody to assist him—in the way of money he meant—but he was not able to carry it through himself. He said that men were afraid to risk any money in a thing that had a patent right about it. He said, if some person would lend him money he could make a good thing for himself, and the one who would assist him.

Re-cross.:

Re-cross-Q. 13. I call your attention to the occasion when he said he had got the machine ready to show you, and asked you to come and see it; was that while you lived at Eberly's Mills?

A. No, sir. He says, " I have it all right." That was the remark he made.

Re-cross-Q. 14. Was that while you lived at Eberly's Mills, or after you moved away?

A. It was after I moved away.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 30th day of June, 1881.
FRED. M. OTT,
Examiner.

JAMES A. SMITH.

For want of witnesses, adjourned at 3.45, P. M., until July 1st, at 10 A. M.

July 1, 1881, 10.45, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs, for respondents, and Mr. Storrow for complainants.

C. S. CLENDENNIN, *being produced, affirmed, and examined, saith;*

Examined by Mr. Hill:

My age is forty-seven; occupation, shoemaker; residence, Eberly's Mills, Cumberland county, Pa.

Q. 1. How long have you resided at Eberly's Mills?

A. I moved there the last of September, 1878, and have lived there ever since.

Q. 2. After you moved there in September, 1878, did you ever see any talking-machines at Daniel Drawbaugh's shop there? If so, when first did you see them?

A. As near as I can recollect it was the middle of November, 1878, that I first saw them.

Q. 3. How happened you to see them at that time?

A. I went there on some business, I don't recollect what the business was, though. Then I saw it fastened against the wall there—the instrument. He then told me it was a talking-machine. He then went down into the lower part of the house or cellar, rather. He then spoke up through it, mentioned "Harrisburg is the capital of Pennsylvania, on the Susquehanna river," and "Cumberland county." That is all I remember of him speaking through it.

Q. 4. Please look at the instrument now shown you, which for identification I mark "P," and state whether you ever saw it, and if so, when and where you first saw it?

A. To the best of my knowledge, that was the machine I saw at that time fastened up against the wall.

Q. 5. You have been in his shop from time to time, from November, 1878, down to last summer (1880), have you?

A. I have.

Q. 6. Did you pay much attention to talking-machines, when you were there from time to time, or take much interest in them?

A. Not in particular.

Q. 7. Did you see any fastened up against the wall, from time to time, as you were there, after November, 1878?

A. I did.

Q. 8. Please look at these instruments "A," "D," "E," "G," "I," "K," "M," "N," "O," and state whether, as you would be in Mr. Drawbaugh's shop, from time to time, from November, 1878, to the summer of 1880, you would see instruments resembling these lying around there in his shop.

A. Yes, sir; that instrument there [indicating "A,"] I know I saw in the shop, and think I saw it fastened up against the partition. The others I am not able to identify, except that I saw and handled some such looking instruments that were lying around there.

Q. 9. Have you had any business dealings with Daniel Drawbaugh since you moved to Eberly's Mills?

A. I have.

Q. 10. Of what character?

A. I done his shoemaking for him and his family.

Q. 11. State whether he was able to pay you for your work, as you did it along from time to time, or not.

[*Objected to, on the ground that the witness has not indicated any knowledge as to Drawbaugh's ability to pay, but only as to the fact as to whether he did pay or not.*]

[*Mr. Hill adds to the question:*]

State the fact whether he did pay or not as the work was done.

A. No, sir; he did not pay as the work was done.

Q. 12. Did you run up an account against him?

A. Yes, sir.

Q. 13. When did he pay it?

A. He paid me last winter some time. I am not able to tell just when.

Q. 14. Did you ask him for money, along from time to time, while the account was running up?

A. I did.

Q. 15. What reason did he give for not making payments on it?

A. He said he was short of funds at the present time.

Cross-examined by Mr. Storrow:

Cross-Q. 16. How soon after you went there did you do any shoemaker's work for him and his family?

A. I done work for him in November, 1878.

Cross-Q. 17. About how much did that first job amount to?

A. That is more than I can tell. I made shoes for some of the children.

Cross-Q. 18. Give me some idea of how much that first job was, whether it was three dollars, or thirty dollars, or how much?

A. I think the first job was something like three dollars and seventy-five cents.

Cross Q. 19. How much was the whole amount of your dealings with him during the two years?

A. It was something in twenty dollars. I am not able to give the particular amount.

Cross-Q. 20. Had he paid you any of it before this last winter?

A. No, sir.

Cross-Q. 21. You mean then, that this money he paid you this last winter was the first he ever paid you?

A. Yes, sir.

Cross-Q. 22. Did you ever see at his shop, before the summer of 1880, any talking-machines, besides these which have been named in your deposition?

A. Not that I remember.

Re-direct by Mr. Hill:

Q. Q. 23. Can you say certainly whether you did, or not?

A. I could not positively say that.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to, before me, this 1st day of July, 1881.
FRED. M. OTT,
Examiner.

C. S. CLENDENNIN.

11.15, A. M., adjourned for want of witnesses, until 2, P. M.

July 1, 1881, 2, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

EDGAR W. CHELLIS, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is thirty-six years; residence, Harrisburg, Pa.; occupation, merchant. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa., and have known him since the fall of 1878.

Q. 1. How came you to make his acquaintance at that time?

A. It was the time that Mr. J. S. Leonard had a clock of his on exhibition here, and he introduced him to me. Then Dr. Moffitt, brought Mr. Drawbaugh to my store with a wooden model of a faucet, and wanted me to purchase a third interest. He (Moffitt) to purchase the other third. It was left there with me, I think, some two or three weeks. It was in the early part of December, or latter part of November, when Moffitt brought him there. I think it was in the early part of December. I asked Mr. Drawbaugh his lowest price. He said he must have two hundred and fifty dollars, as he was in debt, and they were pressing him for money that he owed. I gave him a check for that amount on the 7th of January, 1879.

Q. 2. Then you went into the faucet business with Mr. Drawbaugh and Dr. Moffitt at that time, did you?

A. Yes, sir.

Q 3. Have you been engaged in that business ever since?

A. Yes, sir.

Q. 4. Where have you conducted the manufacturing part of the business?

A. At Eberly's Mills, in the old shop formerly occupied by Mr. Drawbaugh and by the Axle Company.

Q. 5. How long did Dr. Moffitt retain his interest with you in that business?

A. I think five or six months. Then I bought Mr. Moffitt's interest in the faucet and motor.

Q. 6. Do you know what became of the two hundred and fifty dollars that you paid Mr. Drawbaugh, as you have testified?

A. I do not. I supposed he used it to pay his debts, for it was but a short time until he was out of money again.

Q. 7. State what you know about Drawbaugh's financial condition, from the time when you first became acquainted with him down to the summer of 1880, giving any circumstances or facts that may tend to throw light upon it.

A. He was generally very poor and hard pressed for money. I advanced him a great deal of money during that time. It was in sums ranging from twenty-five cents to twenty-five dollars, which was for the support of his family—for necessaries.

Q. 8. When and how did you have your first knowledge of his talking-machines?

A. Mr. Moffitt told me, before I bought in with the faucet, that Dan had a phonograph and a telephone that he had invented.

Q. 9. State the first conversation that you remember having with Mr. Drawbaugh about it.

A. I can't remember, hardly. We conversed about it, I think, the first time I went over there. I can't remember the conversation. I can't remember whether it was before, or after, I gave him the check. It was near the time.

Q. 10. Who brought up the subject of telephones, in that conversation—you or Drawbaugh?

A. I think it was Mr. Drawbaugh.

Q. 11. During your early connection with the faucet business, did or did not Mr. Drawbaugh urge you to go in with him, in the telephone invention?

A. Yes, sir, repeatedly.

Q. 12. Why did you not?

A. Because I was interested in the faucet and motor business, and wished to push them, and I did not think we could do much with the telephone, as Bell had a patent, and I did not know that he could antedate them.

Q. 13. During any of your early conversations with Mr. Drawbaugh, on the subject, did you say anything to him about Bell's patent and claim of priority over all others?

A. Yes, sir; and I advised him to drop it—the telephone, as he could not ante-date Bell. He said he did not know about that, that he had been working on it a good while. It was his way of expressing himself; when I would say "you can't ante-date Bell," he would say, "I don't know about that. I have been working at it a good while."

Q. 14. What duties did Mr. Drawbaugh undertake to perform in connection with the faucet business, in your arrangement with him?

A. He was to devote his whole time and energies to the manufacture of the faucets and motors.

Q. 15. What did you ascertain about the employment of his time and energies, as you began to get into the faucet business?

A. I found out that while I was working with him, making patterns for the faucet, that he worked very well. I would come home in the afternoon and leave work for him to finish and have ready for the next day, and I generally found it on my return just about as I had left it.

Q. 16. Did you discover that something besides faucets was engaging his mind and attention? If so, what, and how soon did you discover it?

A. I was talking to his wife in regard to it, that is, how slow we were getting along. She says, "Mr. Chellis, Dan works at the telephone as soon as you go away, and most every night does not get home till twelve or one o'clock." And she said that she had been talking to him about it, and wanted him to lay the telephone aside and work on the patterns, and give the telephone up, and he said he would go to the poor-house before he would give up working on it.

Q. 17. What plan did you adopt, if any, at that time, to get him to work more steadily on the patterns?

A. I told him, (we were in the shop), "Dan, we will hurry up and get through with these patterns, and we will look into this telephone, and I will go with you." This seemed to please him, and he talked telephone all the balance of the day, but did not do much, if any, work.

Q. 18. Did you mean what you said, or was it only a little stratagem to get him to finish the patterns?

A. I was just using that so as to get him to finish the patterns, and did not really have much purpose of going in with him.

Q. 19. After the patterns were finished, did he continue to urge you to go in with him on the telephone, or not?

A. Yes, sir.

Q. 20. Did you finally consult counsel about the matter? If so, whom and when?

A. I did; but before that, in fact, I was complaining to some one who came there in the shop—I think it was Mr. Shank, but am not certain—in regard to Dan neglecting his work on the patterns. I said I wished I knew how long he had been at work on the telephone. I then could form some idea how long it was going to take to get it out of his head. This party answered, saying he remembered talking through it in 1870. That is why I consulted counsel. I consulted Mr. Jacobs and Mr. Hill. It was late in the summer, I think, of 1879.

Q. 21. Did Mr. Hill come here at your request to investigate the matter?

A. Yes, sir.

Q. 22. Did he encourage you and Mr. Drawbaugh to prosecute Drawbaugh's claim for the patent, and if not, on what grounds did he discourage you?

A. I took Mr. Hill over to visit Mr. Drawbaugh, and Mr. Drawbaugh showed him the telephones, and explained them to him, but Mr. Hill said it would cost a hundred thousand dollars to fight the Bell Company. He considered Mr. Drawbaugh the original inventor, but advised us not to go into it unless we were prepared to raise a hundred thousand dollars to fight the existing companies.

Q. 23. At the time when you first began to be at Drawbaugh's shop, at Eberly's Mills, did Mr. Drawbaugh show you telephones that he had made before that time?

A. Yes, sir.

Q. 24. Please look at the instruments now shown you, marked "A," "B," "C," "D," "E," "F," "G," "H," "I," "J," "K," "L," "M," "N," "O," "P," "Q," and point out which of those instruments you remember to have been in existence at the time when you first began to go to Mr. Drawbaugh's shop, about the end of 1878, or the beginning of 1879?

A. I remember "B," and this, ["F"] but it did not have this wooden cover. I remember "A." I remember these two ["D" and "E,"] and "N" and "G," and I think I remember these two, "L" and "M." There were so many, and they looked so near alike. These two look so near alike. This I remember ["C,"] and this ["H."] I can't remember so much about "O." It looks so nearly like some of the others. I I don't remember in particular about "K." I think I saw it in 1879 or 1880. I remember of seeing it there, but I can't tell how late it was. "*Q*" is a late instrument. I cannot say when it was made. I remember "I," but this is not the top that was on it. That looks like the old top that I saw, [indicating top now marked "I—2."] I remember of seeing this instrument "P," but I don't remember the time when I first saw it. I can't tell when I first saw "J." I don't think it was there at first, but think it was made after I went there.

Q. 25. Did you, or not, talk through these machines, or any of them, during the year 1879?

A. I think I talked through this machine ["H."]

Q. 26. Was that machine fastened up against the wall any part of that year?

A. I think it was fastened up against the cupboard or cupboard door, in the little room where he had his office.

Q. 27. Was it at the time when you first went there?

A. I could not say whether it was or not.

Q. 28. What has been Mr. Drawbaugh's custom, since you began your business there, about having his telephones fastened up against the wall or cupboard for use, or exhibition, or experiment?

A. Those that he was experimenting on he generally kept out of my sight, during the first year of the business; the others were generally lying around on the table. There was generally one on the wall or the cupboard.

Q. 29. Why did he keep out of your sight those upon which he was experimenting?

A. Because, as I said before, I found fault with him for spending his time on the telephones and not on the patterns.

Q. 30. When did you get the patterns finished?

A. I can't remember the date, I might say we were a couple of months working on them. I think we got them done sometime in 1880.

Q. 31. You were somewhat delayed in the business by an interference proceeding with one Hauck, of Mechanicsburg, were you not?

A. Yes.

Q. 32. Then your consulation with counsel, about which you have testified, was before the patterns were finished, was it?

A. Yes, sir.

Q. 33. How soon were the patterns begun after you took hold of the business in January, 1879?

A. I could not say. The first patterns we had made were of wood, to get the brass ones cast from. When I spoke of working two months on the patterns, I alluded only to the brass patterns. And after both the wooden and brass patterns were made, we lost considerable time in testing and changing them.

Q. 34. During what part or parts of the year 1879 was Mr. Drawbaugh urging his telephone invention upon you, as you have testified?

A. I could not tell. There was no particular parts of the year. I could not say what parts of the year—a good many different times, commencing soon after I went in with him on the faucets.

Cross-examined by Mr. Storrow:

Cross-Q. 35. What was the bargain you made with Drawbaugh about going into the faucet business with him?

A. Our agreement says, when the manufacture of the faucets and motor commenced, he was to devote his whole time and energy to the business.

Cross-Q. 36. Do you mean to include the getting up of patterns and tools and other preparatory work, by the term manufacture, in your last answer?

A. No; he was to make the patterns. That was a verbal agreement, and after we commenced the manufacture he was to devote his whole time.

Cross-Q. 37. Was he to make the patterns without any pay?

A. Yes, sir; I to furnish the material.

Cross-Q. 38. When the manufacture begun, was he to have regular pay for his services by the day or month?

A. No, sir.

Cross-Q. 39. What pay was he to have under your bargain with him?

A. One third of the profits.

Cross-Q. 40. So that, if there were no profits, he got nothing; was that the agreement?

A. Yes, sir.

Cross-Q. 41. Did you buy out Dr. Moffitt before you took testimony in the interference case?

A. No, sir; while the interference suit was in progress, but not before we began to take testimony.

Cross-Q. 42. Both he and you testified in that case, did not you?

A. Yes, sir.

Cross-Q. 43. Were Mr. Jacobs and Mr. Hill counsel for you in that case?

A. Yes, sir.

Cross-Q. 44. You have testified that Drawbaugh urged you to go into the telephone with him, soon after you embarked in the faucet business, and that you then declined. Afterwards you acquired an interest in his telephone inventions, did you not?

A. Yes, sir.

Cross-Q 45. When did you first acquire an interest in them?

A. I can't give you the date. I don't remember.

Cross-Q. 46. State as near as you can remember.

A. I think some time in 1880.

Cross-Q. 47. How early in 1880?

A. I could not say without looking at my books.

Cross-Q. 48. Was it in the first quarter of 1880?

A. I could not tell you. My memory of dates is very poor.

Cross-Q. 49. Did anybody else become interested with you at that time?

A. Yes, sir.

Cross-Q. 50. Who?

A. Mr. Jacobs and Mr. Hill.

Cross-Q. 51. What proportion of interest did you three have between you—that is, did you three acquire the whole, or only a part?

A. Only a part. We acquired about a quarter part each.

Cross-Q. 52. A deed of Mr. Drawbaugh, dated in July last, and recorded at the patent office, purports to be a conveyance by Mr. Drawbaugh to the persons named, of his telephone inventions. I suppose that was in pursuance of a sale which you and your associates had made, was it not?

A. I think so. I believe that it was.

Cross-Q. 53. When did you make that sale?

A. I cannot give you the date.

Cross Q. 54. About how long was it before Mr. Drawbaugh filed his application of July last?

A. I could not tell you exactly how long. I can't remember.

Cross-Q. 55. Was it a few days, or was it several weeks or several months?

A. I think it was several weeks.

Cross-Q. 56. Who did you negotiate that sale with?

A. I think it was Moritz Loth and Simon Wolf.

Cross-Q. 57. Where did those negotiations take place?

A. Partly in Harrisburg and partly in Washington.

Cross-Q. 58. They extended over considerable time, did not they?

A. No; not a great deal of time.

Cross-Q. 59. About how long?

A. I can't tell you how long.

Cross-Q. 60. Have not you any recollection how long?

A. I have not.

Cross-Q. 61. It was a matter you took considerable interest in, was not it?

A. Yes, sir.

Cross-Q. 62. And you can't remember when it was, nor how long it occupied?

A. No, I cannot.

Cross-Q. 63. It was between a year and a year and a half ago, was not it?

A. I cannot tell exactly. I shall have to look at my books first.

Cross-Q. 64. Had you and your earliest associates expended any money about Drawbaugh's telephone before you began these negotiations?

A. I don't think we had; I don't remember.

A. Yes, sir; I to furnish the material.

Cross-Q. 38. When the manufacture begun, was he to have regular pay for his services by the day or month?

A. No, sir.

Cross-Q. 39. What pay was he to have under your bargain with him?

A. One third of the profits.

Cross-Q. 40. So that, if there were no profits, he got nothing; was that the agreement?

A. Yes, sir.

Cross-Q. 41. Did you buy out Dr. Moffitt before you took testimony in the interference case?

A. No, sir; while the interference suit was in progress, but not before we began to take testimony.

Cross-Q. 42. Both he and you testified in that case, did not you?

A. Yes, sir.

Cross-Q. 43. Were Mr. Jacobs and Mr. Hill counsel for you in that case?

A. Yes, sir.

Cross-Q. 44. You have testified that Drawbaugh urged you to go into the telephone with him, soon after you embarked in the faucet business, and that you then declined. Afterwards you acquired an interest in his telephone inventions, did you not?

A. Yes, sir.

Cross-Q 45. When did you first acquire an interest in them?

A. I can't give you the date. I don't remember.

Cross-Q. 46. State as near as you can remember.

A. I think some time in 1880.

Cross-Q. 47. How early in 1880?

A. I could not say without looking at my books.

Cross-Q. 48. Was it in the first quarter of 1880?

A. I could not tell you. My memory of dates is very poor.

Cross-Q. 49. Did anybody else become interested with you at that time?

A. Yes, sir.

Cross-Q. 50. Who?

A. Mr. Jacobs and Mr. Hill.

Cross-Q. 51. What proportion of interest did you three have between you—that is, did you three acquire the whole, or only a part?

A. Only a part. We acquired about a quarter part each.

Cross-Q. 52. A deed of Mr. Drawbaugh, dated in July last, and recorded at the patent office, purports to be a conveyance by Mr. Drawbaugh to the persons named, of his telephone inventions. I suppose that was in pursuance of a sale which you and your associates had made, was it not?

A. I think so. I believe that it was.

Cross-Q. 53. When did you make that sale?

A. I cannot give you the date.

Cross Q. 54. About how long was it before Mr. Drawbaugh filed his application of July last?

A. I could not tell you exactly how long. I can't remember.

Cross-Q. 55. Was it a few days, or was it several weeks or several months?

A. I think it was several weeks.

Cross-Q. 56. Who did you negotiate that sale with?

A. I think it was Moritz Loth and Simon Wolf.

Cross-Q. 57. Where did those negotiations take place?

A. Partly in Harrisburg and partly in Washington.

Cross-Q. 58. They extended over considerable time, did not they?

A. No; not a great deal of time.

Cross-Q. 59. About how long?

A. I can't tell you how long.

Cross-Q. 60. Have not you any recollection how long?

A. I have not.

Cross-Q. 61. It was a matter you took considerable interest in, was not it?

A. Yes, sir.

Cross-Q. 62. And you can't remember when it was, nor how long it occupied?

A. No, I cannot.

Cross-Q. 63. It was between a year and a year and a half ago, was not it?

A. I cannot tell exactly. I shall have to look at my books first.

Cross-Q. 64. Had you and your earliest associates expended any money about Drawbaugh's telephone before you began these negotiations?

A. I don't think we had; I don't remember.

Cross-Q. 65. Under the sale that was negotiated with Mr. Wolf and Mr. Loth, you still retained an interest in some form, did not you?

A. Yes, sir.

Cross-Q. 66. You are the Mr. Chellis who is named as a defendant in the bill of complaint in this case, are you not?

A. Yes, sir.

Cross-Q. 67. What were the terms of the original bargain you made with Mr. Drawbaugh, when you acquired the interest in his telephone inventions, which you have stated?

A. I was to get a quarter of the proceeds.

Cross-Q. 68. What was he to have?

A. He was to have the same.

Cross-Q. 69. Then nothing was paid him for that interest which he parted with, but only a promise that he should have one quarter of the next proceeds; is that so?

A. I don't understand that question. Do you mean Mr. Drawbaugh's interest to Mr. Jacobs and myself?

Cross-Q. 70. I mean to ask you what he was to receive out of the whole business, in addition to one quarter of the profits?

A. He was to receive one quarter of the proceeds of the sale.

Cross-Q. 71. How did you come to negotiate with Mr. Wolf and Mr. Loth for the sale?

A. All I know they came and negotiated with us.

Cross-Q. 72. Had you known either of them before?

A. No, sir.

Cross-Q. 73. Had you known Mr. Marx before?

A. No, sir.

Adjourned until July 2, 1881, at 10 o'clock, A. M.

July 2, 1881, 10, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

Cross-examination of Mr. Chellis continued by Mr. Storrow:

Cross-Q. 74. Can you now tell me when it was that you first acquired an interest in Drawbaugh's telephone inventions?

A. The 6th day of May, 1880.

Cross-Q. 75. When did you begin your negotiations with Mr. Wolf, Mr. Loth, and their associates?

A. On the 22d of June, 1880, a conditional sale was made, but Mr. Wolf was registered here at Harrisburg on the 24th of May and came here on or about that time, to see me about this business.

Cross-Q. 76. Mr. Wolf resided in Washington at that time, did not he?

A. I believe he did.

Cross-Q. 77. When did you become acquainted with Mr. Abraham, one of the counsel in this suit?

A. On or about the 21st of July, 1880.

Cross-Q. 78. Where did you meet him then?

A. If I remember right, it was Washington, D. C.

Cross-Q. 79. Were any of your associates in Washington with you at that time? If so, whom?

A. Mr. Jacobs, Mr. Drawbaugh, Mr. Hill, and myself were all there.

Cross-Q. 80. Mr. Hill lives in Washington, and Mr. Jacobs in Harrisburg, do they not?

A. They did at that time.

Cross-Q. 81. Mr. Jacobs has continued to live in Harrisburg, has he not?

A. Yes, sir.

Cross-Q. 82. I noticed that the assignment of Drawbaugh to Klemm, Marx, Wolf, and Loth, dated July 21st, 1880, bears the names of yourself and Mr. Jacobs as witnesses. When and where was that deed executed?

A. In Washington. I believe it was executed on the day of its date.

Cross-Q. 83. That deed was in form from Drawbaugh alone, but I suppose it was in effect to carry out the sale or bargain made by yourself and your three associates. Am I correct in that?

A. Yes, sir.

Cross-Q. 84. According to the face of that deed, the entire interest passed to Klemm, Marx, Wolf, and Loth. You and your three original associates were to have an interest, and I suppose that was to come to you in the shape of shares of stock in the corporation to be formed. Was that the expectation and understanding of yourself and your associates?

A. Yes, sir; the interest we retained was to be represented by shares of stock.

Cross-Q. 85. How many shares of stock in The People's Telephone Company did you receive in pursuance of that understanding?

A. I received a considerable amount of stock, but that being my own private business, I decline to answer.

Cross Q. 86. The printing of the defendants' testimony is being done at the printing-office of the Harrisburg *Independent*, a newspaper of this city, is it not?

A. Yes, sir.

Cross-Q. 87. You, or you and Mr. Jacobs, selected that office and arranged with that office about the printing, did you not?

A. I can't say it was us that made the arrangement. Mr. Abraham was here, and I recommended Mr. Wallower, the proprietor of the *Independent*, as he had done my printing in the faucet case.

Cross-Q. 88. I call your attention to an article in the Harrisburg *Independent* of Monday evening, June 27th, 1881, entitled, "The Telephone Case—The Taking of Evidence Resumed." I also call your attention to an article in the Harrisburg *Independent*, Thursday evening, June 30th, 1881, headed, "More Evidence—Testing the Telephone. Drawbaugh's Claim Becoming Unquestionable." Did you read these two articles when they came out?

A. I believe I did.

Cross-Q. 89. Has the subject of having some articles about Drawbaugh's case in the Harrisburg newspapers been the subject of any conversation within the last three months between you and anybody connected with that newspaper, or between you and any of your associates or counsel?

A. Yes, sir; Mr. Jacobs did not like the idea of these articles being in the newspapers, and wanted me to speak to Mr. Wallower to discontinue the printing, or publishing I should say, of these articles.

Cross-Q. 90. How do you suppose the newspaper got hold of the statements as to the witnesses and testimony hereafter to be presented by the defendants, which are contained in the paper of June 27th?

A. I could not say, as I did not inform Mr. Wallower in regard to it.

Cross-Q. 91. During last month, the *Independent* republished two long articles on the subject of Drawbaugh's inventions on the telephone, which appeared in other newspapers many months ago. I suppose you saw those articles in the *Independent*?

A. Yes, sir.

Cross-Q. 92. How do you suppose that the *Independent* got hold of those articles, to republish them just now?

[*Mr. Hill says he has declined to interfere in any way with the cross-examination, although nearly all of it has been entirely irrelevant to the question whether Mr. Drawbaugh or Mr. Bell were the first inventors of the telephone, and has been, moreover, entirely outside of the line of the direct examination, so as to amount practically to a new direct examination on behalf of the complainant and that on matters entirely irrelevant and immaterial. He expresses the hope that this line of cross-examination will be cut as short as possible, and will be confined to what the witness knows, instead of what he supposes.*

Complainants' counsel says that he has been unable to see how any testimony from this witness is relevant to the question whether Mr. Drawbaugh or Mr. Bell is the first inventor of the telephone, inasmuch as the witness testified that he had no knowledge on the subject, and never knew Drawbaugh until two years and a half after the grant of Mr. Bell's patent.]

A. I suppose they were copied from New York and Boston papers.

Cross-Q. 93. Did it ever occur to you to wonder or inquire how the *Independent* happened to get hold of those old papers to copy from just at that time?

[*Objected to as irrelevant and immaterial.*]

A. No, sir.

Cross-Q. 94. In your examination yesterday, a number of Mr. Drawbaugh's instruments, which have hitherto been introduced in this case, were shown to you for the purpose of identification. Where were those instruments at the time you acquired an interest from Mr. Drawbaugh in May, 1880?

A. I believe they were then at the shop at Eberly's Mills.

Cross-Q. 95. When were they taken away from there, and where were they first taken?

A. I could not tell you exactly. It was soon after that they were taken away. They were brought over here to Harrisburg. I think they were brought to my store.

Cross-Q. 96. Were there brought to your store at that time all the instruments that were shown to you yesterday, or only such of them as you could then find and collect?

A. I don't remember what instruments were brought at that time.

Cross-Q. 97. About how long did they remain in your store?

A. I can't remember; it was only a short time.

Cross-Q. 98. When you made your conditional sale to Wolf and his associates in May, 1880, did the instruments you had in your store pass into their custody?

A. I am not positive that the instruments were at my store at that time, but they did not then pass into their custody.

Cross-Q. 99. When they left your store, where did they go to?

A. I don't remember whether they went back to the shop or to the bank, or where.

Cross-Q 100. Where were they last autumn and last winter?

A. Part of the time in Washington and part of the time here in Harrisburg.

Cross-Q. 101. You bought Drawbaugh's electric-clock inventions, did you not?

A. Three-fourths interest in it, I bought.

Cross-Q. 102. When did you buy that and from whom?

A. I bought one-fourth interest from Jacob Shettel—I could not tell you when without looking at the transfer papers—one-fourth interest from Jacob Grissinger, and one-fourth from Theodore Grissinger.

Cross-Q. 103. Mr. Shettel testifies that he sold you his interest in the spring of 1879, and the Grissingers sold you theirs in the spring of 1880. Does that agree with your recollection?

A. The sales were about a year apart. I think that is right, 1879 and 1880.

[*The two newspapers above referred to are marked for identification by the examiner.*]

Re-direct by Mr. Hill:

Q Q. 104. Have newspaper men been to you and Mr. Jacobs, from time to time, to get you to furnish information for publication about this suit, as a matter of news, and has their request been denied?

A. Yes, sir; we always refused to give them any information.

Q. Q. 105. Did Mr. Hill and Mr. Abraham concur with Mr. Jacobs in disapproving publications regarding the suit?

A. Yes, sir.

Q. 106. When Mr. Wolf first came to you to negotiate for the purchase of the Drawbaugh invention, did he, or not, tell you that he re presented a party who had already purchased the telephone inventions of Klemm and Tisdel, and were purposing to enter upon their manufacture and sale, and that they expected trouble with the Bell Telephone Company, who claimed to monopolize electric telephones of all kinds, and that they had already fully determined to test the validity and scope of the Bell patents, and the question whether the Klemm and Tisdel telephones were infringements thereof? What, if any, statements did he make on those several points?

A. He did state something to that effect. It was in Mr. Jacobs' room at the hotel. I can't remember the exact words he said. It was to the effect that they wanted to use it in evidence against the Bell Company. I mean, they wished to use the Drawbaugh invention in evidence against the Bell Company.

Q. Q. 107. Did he, or not, state that he had been advised that a patent might yet be granted upon the Drawbaugh invention, and that, unless they purchased the invention, the Bell Company might themselves purchase it, if they found their suit likely to be defeated by it, and might then get a patent on it themselves, which they could use against Mr. Wolf and his associates?

A. Something to that effect, but I cannot remember the exact words.

Q. Q. 108. Did Mr. Hill have anything to do with the faucet interference, except to argue the case before the examiner of interferences?

A. No, sir.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 2d day of July, 1881.
FRED. M. OTT,
Examiner.

E. W. CHELLIS.

Adjourned until Wednesday, July 6th, at 2, P. M.

July 6, 1881.

Examination resumed, pursuant to adjournment, at 2, P. M.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

MICHAEL DELLINGER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is thirty-eight years; residence, Lower Windsor township

York county, Pa.; occupation, miller. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa., and have known him since 1877.

Q. 1. How came you to make his acquaintance in 1877?

A. I went there to visit my brother William, who was running the mill there at that time.

Q. 2. In what month of 1877 was it?

A. In November.

Q. 3. How long were you there?

A. I might have been there two hours in Drawbaugh's shop.

Q. 4. Did Mr. Drawbaugh show you any talking-machines at that time?

A. He showed me two or three machines there he had—talking-machines.

Q. 5. Please look at the machines "A," "B," "C," "D," "E," "F," "G," "H," "I," "L," "M," "O," and see if you recognize any of them as being the machines Mr. Drawbaugh then showed you, and if so, please point them out to the examiner.

A. "A" is one, and "D," and "H," also.

Q. 6. Did he or anybody talk through the machines at that time?

A. No, sir.

Q. 7. Did he offer to talk through them, if you wanted to hear?

A. Not that I recollect.

Q. 8. Did he tell you whether they were operated by electricity or not?

A. He told me that they were talking-machines, and that they were worked by electricity, or something to that effect.

Q. 9. Did he show you any wires or batteries connected with the talking-machines, or ready to be connected with them?

A. Yes, sir.

Q. 10. Are these three machines that you have picked out all the talking-machines that he showed you, or were there others that you cannot now identify?

A. That is all that I know of. He had some more machines there, of course, something like them, but I can't identify them.

Q. 11. Were you ever there in his shop before or after that visit?

A. No, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 12. What did you go to the shop for, then?

A. I went there with my brother, to see some of his machinery and for pastime.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 6th day of July, 1881.
FRED. M. OTT,
Examiner.

MICHAEL DELLINGER.

HENRY (OF JACOB) DELLINGER, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is forty-three years; residence, Spring Garden township, York county; occupation, carpenter and butcher. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa., and have known him since 1877.

Q. 1. Were you at Eberly's Mills at the time your brother William moved there?

A. Yes, sir.

Q. 2. Where you in Daniel Drawbaugh's shop when William moved?

A. Yes, sir, I was in. Drawbaugh was not there, though.

Q. 3. Were you there again during the year 1876?

A. Yes, sir; I was.

Q. 4. Were you in Daniel Drawbaugh's shop at that time?

A. I was.

Q. 5. Was he there?

A. He was.

Q. 6. Then you were acquainted with him in 1876 instead of 1877?

A. I was not much acquainted with him. I would not have known him if I had seen him the second time. We were in there only a few minutes, and he did not explain much to us that time.

Q. 7. What time in the year 1877 were you there in Mr. Drawbaugh's shop?

A. The fore part of June.

Q. 8. How do you fix the time as the fore part of June?

A. I had hired a boy on the first of June, and I know he had only been there a few days at that time. They were planting tobacco, him and my wife, at that time.

Q. 9. How do you know it was the year 1877?

A. I only lived one year on that farm, and I looked at the boy's time-book this morning.

Q. 10. How came you to go to Eberly's Mills at that time?

A. To visit my brother William.

Q. 11. Who went with you on that visit?

A. My brother, John, and his wife, Susan.

Q. 12. While you were at Mr. Drawbaugh's shop at the time of that visit, did he show you any talking-machines?

A. Yes, sir; he did.

Q. 13. Please look at the machines on the table, marked "A," "B," "C," "D," "E," "F," "G," "H," "I," "L," "M," "O," and see whether you recognize any of them as machines that you saw at Drawbaugh's shop at that time, and if so, point out to the examiner such machines as you recognize.

A. This "F" and "H," "G," "L," "B;" that is all I can recollect of; I saw more, but they are not here.

Q. 14. Did Mr. Drawbaugh, or anybody else, talk through the machines while you were there?

A. No, sir.

Q. 15. Did he tell you how they were operated?

A. Yes, sir; he told me it was to be a talking-machine that he was working at—making these articles for—to talk through a wire to a distance. He did not say how far. He said that it was to be operated by electricity.

Q. 16. Did he state how they would talk—how they would hear.

A. He stated that people would talk together through it as quick and as plain as we talked together there in the shop.

Q. 17. Did you see any batteries or wires connected with the talking-machines?

A. I saw a battery and a few wires, two or three—two I am certain. He had more wires, but they were attached to clocks, and he had more than one battery, too, but only one that I saw connected with a talking-machine.

Q. 18. Have you ever been there in the shop since that visit?

A. Since 1877? No, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 19. What did you go to Drawbaugh's shop for, on the visit when you saw the talking-machines.

A. I went down to see his machinery, me any my brother William, who took me down to see it.

Cross Q. 20. Did you go to see any particular machine, or go to see his machinery and inventions generally?

A. We went down to see the big clock, that he was working at and the tools, that he made himself.

Cross-Q. 21. What tools did you see that he made himself?

A. I saw some hammers, punches, tongs, all kind of chisels, and some boring machines, that he had to bore iron—drills; and he had wheels—brass cog-wheels that he made. He made one while I was there. Nothing else in particular. He showed me how he separated iron and brass and steel filings and turnings. He had them all in a pile and separated them.

Cross-Q. 22. What kind of a machine did he make the cog-wheel on, that he made?

A. It was a turning machine, where they turn iron on.

Cross-Q. 23. Was it one of his own getting up?

A. He told me so, that he got it up himself.

Cross-Q. 24. How big was the clock that he was working on?

A. I could not tell. It was perhaps three or three and a half feet long, and maybe eighteen inches wide—a heavy clock.

Cross-Q. 25. Was it a common clock, or an electric clock?

A. It was to run by a wire.

Cross-Q. 26. How long were you at his shop at that visit?

A. I was there the best part of a half a day, I guess. I was there on Sunday forenoon, Saturday evening and Saturday afternoon.

Cross-Q. 27. When did you next see any of these talking-machines, after that visit?

A. I never saw them after that, until he was down at my place, I think three weeks ago, and had some with him.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 6th day of July, 1881.

FRED. M. OTT,
Examiner.

HENRY DELLINGER, of J.

JOHN DELLINGER, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is forty-seven years; residence, Spring Garden township, York county, Pa.; occupation, laboring. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa. I first knew him in 1877.

Q. 1. You have been present while your brother Henry was testifying this afternoon, have you not?

A. Yes, sir.

Q. 2. Do you remember the visit which he says he and you made together to your brother William, at Eberly's Mills, in 1877?

A. Yes, sir.

Q. 3. In what month was that visit?

A. In June.

Q. 4. How do you fix the time as in June?

A. I had a lot of tobacco plants pulled, and had them ready to plant, and my brother he came, and I had a notion not to go, and I put the children at planting them then. I know from that that it was the beginning of June, but I do not know what day.

Q. 5. Were you down at Daniel Drawbaugh's shop with your brother on that occasion?

A. Yes, sir.

Q. 6. Do you remember seeing any talking-machines there at that time?

A. Yes, sir.

Q. 7. Please look at machines now shown you, marked "A," "B," "C," "D," "E," "F," "G," "H," "I," "L" "M" and "O," and state if you recognize any of them as machines seen by you at Daniel Drawbaugh's shop at that visit.

A. I saw "M," "B," and "H." I believe those are all that I can identify. He had so many lying around there, that I can't remember them, but he said it would be a talking-machine.

Q. 8. Did he tell you how it was operated?

A. Yes, sir; he said by a wire and by talking.

Q. 9. Did he tell you how far he could talk through it?

A. No, sir, not particular. He said you could talk through it as plain as we are talking here.

Q. 10. Did you see any wires or batteries, connected with the talking-machines, that you remember?

LEPHONE COMPANY,-1

A. I did; yes, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 11. Had you ever seen any talking-machines before that visit?

A. No, sir; I had not.

Cross-Q. 12. When did you next see any of Drawbaugh's talking-machines, after that visit?

A. I did not see any since until to-day.

Re-direct by Mr. Hill:

Q. Q. 13. Have you ever been at Drawbaugh's shop, since that visit?

A. No, sir.

Re-cross by Mr. Storrow:

Re-cross-Q. 14. When did your brother begin to run the mill?

A. I guess it was in 1876, when he moved there.

Re-cross-Q. 15. When did he stop running it?

A. I guess in 1880, I think.

Re-cross-Q. 16. Did he move away from Eberly's Mills then?

A. No, sir; I think he lived there a year after he left the mill.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 6th day of July, 1881.
FRED. M. OTT,
Examiner.

JOHN DELLINGER.

Adjourned until July 7th, at 10 o'clock, A. M.

July 7, 1881, 10.40, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs, for respondents, and Mr. Storrow, for complainants.

JEREMIAH KOHLER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is forty-five; residence, Bridgeport, Cumberland county, Pa., occupation, miller; I have known Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa., and have known him for eighteen years.

Q. 1. Did you at one time live at Eberly's Mills? If so, when did you move there, and when did you move away from there?

A. Yes, sir; I moved there in April, 1873, and moved away from there in April, 1874.

Q. 2. State whether Mr. Drawbaugh showed you any talking-machines, while you lived there at Eberly's Mills?

A. Yes, sir.

Q. 3. Please look at the machines "A," "B," "C," "F," now shown you, and state when and where you first saw them?

A. I saw them in 1873, down in Daniel Drawbaugh's shop.

Q. 4. Are you certain that you saw this machine "A," at Daniel Drawbaugh's shop, at the time you lived at Eberly's Mills, and before you moved away?

[*Objected to as leading, and as an attempt by the party to contradict his own witness.*]

[*Mr. Hill states that, on the contrary, he wishes to establish the fact.*]

A. Yes, sir.

Q. 5. What was Mr. Drawbaugh doing to it, or with it, at the time you saw it, while you lived there?

A. He was working at it,—making it.

Q. 6. Do you remember whether it had the mouthpiece at the side, as now, or in the middle, at that time?

A. I don't remember that.

Q. 7. Do you remember this brass plate, and this electro-magnet, on the back side of the machine, at that time?

A. Yes, sir.

Q. 8. Did Mr. Drawbaugh talk to you through the talking-machine, while you lived there at Eberly's Mills?

A. Yes, sir.

Q. 9. Where was he, and where were you, when he was talking to you through the machines at that time?

A. I was on the second floor of the shop. He was down on the lower floor.

Q. 10. Did you hear and understand, through the machine, what he said?

A. Yes, sir.

Q. 11. Did he talk to you once, or more than once, through the machine?

A. He talked to me several times.

Q. 12. Was it before or after you saw him making this machine "A"?

A. I don't remember that.

Q. 13. Point out the first talking-machines that you saw at Drawbaugh's shop?

A. I saw that ["B."]

Q. 14. Do you remember whether you saw this ["F"] before you saw this ["A"] or not?

A. I saw that tumbler ["F"] first.

Q. 15. Do you remember whether you saw this ["C"] before you saw "A" or not?

A. Yes, sir; I saw that there one, [indicating "C."]

Q. 16. Do you remember whether you saw this one ["C"] before you saw these two ["F" and "B"] or not?

A. No, sir; I don't remember that.

Q. 17. What was your business at Milltown while you lived there?

A. Milling.

Q. 18. Did you know anything about Drawbaugh's financial circumstances at that time?

A. Yes, sir.

Q. 19. What were they?

A. He was a poor man.

Q. 20. Did he used to get flour of you occasionally for his family?

A. Yes, sir.

Q. 21. Did you have any difficulty about getting the money from him for the flour?

A. Yes, sir.

Q. 22. When you saw the talking-machines in his shop while you lived there, did he tell you how they were operated; whether by electricity or not?

A. By electricity.

Q. 23. Did you see any wire or wires connecting the machines that he talked into, and you listened at?

A. Yes, sir.

Q. 24. How many wires, if you remember?

A. I don't remember how many.

Q. 25. Did you see anything there that he called a battery?

A. Yes, sir.

Q. 26. Do you remember whether that was connected with the talking-machines or not?

A. Yes, sir; it was.

Q. 27. Were you in Mr. Drawbaugh's shop occasionally after you moved away from Milltown?

A. Yes, sir.

Q. 28. How often, do you think, down to the year 1879?

A. I can't recollect how often I have been there.

Q. 29. Was it a half dozen times, or more, or less? Give the best idea you can.

A. It might have been a half dozen times.

Q. 30. Did you see talking-machines every time you were there afterwards, or not?

A. Yes, sir; I saw them there when I was there.

Q. 31. Were you there when the Clock Company, Grissinger & Shettel, were working there?

A. No, sir.

Q. 32. You were shown, at Mr. Jacobs' office, this morning before you came on the stand, all the talking machines that have been used here in evidence, and you stated that you could identify only these four machines, "A," "B," "C," and "F." Was that statement correct?

A. Yes, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 33. Are these machines, "A," "B," "C," and "F," in the same condition now that they were in when you first saw them—have they been changed any since then?

A. No, sir; I don't think they have, but are in the same condition.

Cross-Q. 34. Did you see either of these four machines on any of your subsequent visits to the shop, after you moved away from Milltown?

A. Yes, sir.

Cross-Q. 35. How long have you lived at Bridgeport?

A. I have lived there four months.

Cross-Q. 36. Where did you live before that?

A. At West Fairview.

Cross-Q. 37. Did you work at a mill there, and if so, whose?

A. I worked in the iron works.

Cross-Q. 38. How long did you work there?

A. I worked there about two years.

Cross-Q. 39. Where did you live before that?

A. At Harrisburg.

Cross-Q. 40. How long did you live in Harrisburg?

A. I lived here about a year and nine months.

Cross-Q. 41. Where did you live before that?

A. Shiremanstown.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 7th day of July, 1881.
FRED. M. OTT,
Examiner.

J. KOHLER.

CHARLES H. MATTHIAS, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is going on forty-six years; residence, Manchester, York county, Pa.; occupation, carpenter; I have been farming lately. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.; I have known him since 1877.

Q. 1. How long have you lived at or near Manchester?

A. Six years; within a half a mile of Manchester.

Q. 2. How far is that from Eberly's Mills?

A. It is about twenty miles.

Q. 3. When William S. Dellinger's concern failed, at Eberly's Mills, did you become assignee of the estate?

A. Yes, sir.

Q. 4. What was the first time that you were ever in Daniel Drawbaugh's shop, at Eberly's Mills?

A. In 1877, towards fall. I can't remember the exact time. It was pretty warm yet. I know that. My wife was along with me.

Q. 5. Did Mr. Drawbaugh at that time show you any talking-machines?

A. Yes, sir.

Q. 6. Did he talk through them to you at that time?

A. Yes, sir.

Q. 7. Did you hear and understand plainly what he said through the machines?

A. Yes, sir.

Q. 8. Where was he when he was talking through them, and where were you when you were listening?

A. He was in the second story. I was in the first, I think they call it, away back in the corner.

Q. 9. Were he and you in the same end of the building, or in opposite ends?

A. In opposite ends.

Q. 10. Do you know what instrument it was that he talked into at that time?

A. That one standing there [indicating "H,"] or one like it. I think it was the same.

Q. 11. Was the instrument you used in listening at down-stairs, a large or small instrument?

A. A small one.

Q. 12. You have seen all the instruments this morning that have been used here in evidence; which one most closely resembles the small instrument that you listened at, at that time?

A. This here one ["E"] I can remember.

Q. 13. Do you recollect seeing these instruments, ["G" and "O,"] or either of them, at that time?

A. Yes, sir.

Q. 14. Were you in Mr. Drawbaugh's shop any time during the year 1878? If so, how many times?

A. Once, that I can remember.

Q. 15. Did you see any talking-machines there, then?

A. Yes, sir.

Q. 16. On looking over the other instruments this morning, were you able to identify any, except these four, "E," "G," "H," "O," as positively being the instruments you had seen at Drawbaugh's shop at either of those visits?

A. I might have seen some more, but I can't remember that I did. I can't identify any except these four.

Cross-examined by Mr Storrow:

Cross-Q. 17. Why did you go to Drawbaugh's shop?

A. Mr. Dellinger took me down.

Cross-Q. 18. What did he take you down there for?

A. He said I should go along down there to Mr. Drawbaugh's, that he was making some instruments there that he wanted to get him to show to me.

Cross-Q. 19. What instruments did he show you when you got there

A. First, he showed me his clocks that he was making.

Cross-Q. 20. What else?

A. Then his telephone.

Cross-Q. 21. Did he call it a telephone?

A. That is the way I understood it.

Cross-Q. 22. You had read of telephones in the papers, or heard of them at that time, had not you?

A. No, sir.

Cross-Q. 23. What did Drawbaugh tell you at that time about his telephone?

A. Dellinger said that he should show it to me—talk through it.

Cross-Q. 24. What did Drawbaugh say?

A. He just went to work then and talked. He said we should go and listen.

Cross-Q. 25. Didn't you have any conversation with Drawbaugh about the telephone except that?

A. Not before that.

Cross-Q. 26. Did you ever have any conversation with Drawbaugh about the telephone, except just what you have stated?

A. He said there then, that he has got it all complete now, but he is still improving more. That was at the time of the first visit. He said he would like to have a patent for it, but he was too poor. That is all I know or can remember.

Cross-Q. 27. What did he say to you about it the next time you saw him?

A. Dellinger said, "How is the telephone business?" He said, "It is all right." He was talking through it then again.

Cross-Q. 28. What instruments did you or he talk through this second time?

A. I can't remember whether they were the same ones or not. I did not take particular notice at that time.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, July 7th, 1881.

FRED. M. OTT,
Examiner.

CHARLES H. MATTHIAS.

Adjourned for dinner until 2, P. M.

Examination resumed at 2.45, P. M.

Present, same counsel.

HARMAN K. DRAWBAUGH, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is thirty-three; residence, Harrisburg, Pa.; occupation, machinist.

Q. 1. What relation are you to Daniel Drawbaugh, of Eberly's Mills?

A. I am his nephew, a son of J. B. Drawbaugh.

Q. 2. State when you first heard your uncle, Daniel Drawbaugh, speak of the possibility of conveying the human voice, or other sounds, to a distance by means of electricity.

A. In the fall and winter of 1867 and 1868.

Q. 3. How did you happen to have conversation with him about it at that time, and what was the conversation?

A. I was teaching singing those two winters at Milltown, or Eberly's Mills, and he was one of the interested parties that attended singing very regularly. In our conversation on music, he got talking about sound—different sounds—and told me that they were produced by vibration; and also stated that the different positions, or different tones, high or low, were different vibrations. He said that there were more vibrations in a high tone than there were in a low tone. He gave me at that time the number of vibrations at concert pitch of high and low C, or what was supposed to be that. I don't remember the number. He also told me at that time that I would consider him foolish if he was to tell me that those vibrations would move a piece of iron an eighth of an inch or more in thickness. I laughed at him that time, and told him I supposed I would. He told me then that it certainly would do it, and I don't just know the words, but that, by that means, the sound could be carried to a distance on a wire, by the use of electricity. He also stated that he was going to do it, too—said he had been working at it. I remember of him trying to explain it to me, too, but I could not understand it—did not take any interest in it, really. We had quite a number of conversations on it. I could not just say what time, but it was during those two terms of singing that I had there. He used to throw his head back, and get me to put my finger on his throat, while he made different sounds, in order to show the jar or power of the vibrations of the throat. [Witness indicates with his finger the upper part of the larynx, and shows how it was done.]

Q. 4. When did he first exhibit to you any of his talking-machines?

A. In 1870, about January.

Q. 5. Where had you been for several months prior to that time?

A. In Missouri.

Q. 6. Please look at the machines "B" and "F," now shown you, and state when he first showed these two machines to you.

A. This here machine here [indicating "F"] I am not positive, but think I saw before I went away, but I am sure I saw both the tumbler "F," and machine "B," on my return in January, not quite in the condition they are in now, though. This instrument here ["B"] had a cross-bar of iron right in front of that coil there, [indicating the electro-magnet of "B."] I hardly know how the cross-bar was supported. I remember taking hold of it with my finger and moving it a little. The end of that box there ["B"] there was a piece or skin of bladder across, fastened with a string. I remember that. The other end, I think, had a funnel shape, made out of paper—I supposed it to be paper or pasteboard.

Q. 8. Do you mean that the funnel-shaped paper was applied to the end of the tin box of machine "B," farthest from the electro-magnet?

A. To the best of my recollection it was.

Q. 9. Do you remember anything about his use of plumbago in connection with his use of either of those instruments? If so, which one?

A. Yes, sir; I remember of his using it in this one ["F."]

Q. 10. Do you remember anything about his adjustment of instrument "F"? If so, how did he adjust it?

A. I remember very distinctly of him having a nut on this brass rod here. and adjusting that, [indicating the rod that projects through the top of the wooden cover.]

Q. 11. Did he talk to you, or did you talk, through those machines "F" and "B" at that time, early in 1870?

A. No, sir; not in words, not at that time. He used to get me to make sounds at that time—sounds that he thought had more force, or more vibration, to move the instrument clearly. I remember very distinctly of playing the violin in it.

Q. 12. How soon after that did he talk to you through the instrument, if at all?

A. A very short time afterwards. There were some words that we could understand only.

Q. 13. Give your best idea of the time.

A. It was not more than ten days or two weeks. It just happened while he was experimenting with that machine. I remember that very well.

Q. 14. When did you go to Waynesboro', Pa., to work?

A. In the spring of 1872.

Q. 15. Prior to your going to Waynesboro' to work, did you talk much, or hear him talk much, through the instruments?

A. Yes, sir; I was about the shop then a great deal.

Q. 16. Were the instruments in such condition prior to your going to Waynesboro', that you could hear and understand all that was said through them, or not?

A. Just for a little while at a time. They appeared to require a great deal of adjusting and working at—merely trials, that he got me to help him.

Q. 17. Up to that time, was he at work at it pretty constantly or not?

A. Yes, sir; I knew that he put in the majority of his time at it.

Q. 18. Please look at the machine marked "C," now shown you, and state whether you recollect seeing a machine there in his shop having the parts constructed like this instrument ["C."]

A. I remember of seeing it very well, but I really couldn't say when. I know it was a good while ago.

Q. 19. Do you remember whether it was before you went to Waynesboro' to work or not?

A. My impression is that it was before I went to Waynesboro'.

Q. 20. Do you recollect whether you ever talked, or heard anybody talk, through instrument "C"?

A. No, sir; I don't remember of ever trying to speak in it.

Q. 21. Is the instrument "C" in the same condition as when you saw it at that early time, or were there other parts upon it at that time that are not now upon it?

[*Objected to as leading.*]

A. I think there was a magnet at the back of it, or what I suppose to be the back—this tin here.

Q. 22. Please look at the magnets as arranged upon the instrument which is now shown you, and which, for the purpose of identification, I now mark as "C reproduced," and state how the arrangement of the two

ELEPHONE COMPANY,-1

magnets there compares with the arrangement of the magnet on instrument "C," as you recollect seeing it at that time.

A. In my mind, they are the same, with the exception of that horse-shoe magnet. I don't remember of seeing that in that position. I saw a great many horse-shoe magnets of different sizes hanging around in different parts of the shop with pieces of iron suspended to them.

Q. 23. Do you remember the electro-magnet at the back of the diaphragm on instrument "C"?

A. Yes, sir; I remember of it looking as that does now.

Q. 24. How long did you work at Waynesboro'?

A. I am not right positive, but it was several months.

Q. 25. When did you commence to assist again your uncle Daniel in his shop?

A. In the fall of 1874.

Q. 26. Where were you in the meantime, that is, from the time when you left Waynesboro' to the time when you commenced to assist Mr. Drawbaugh, in the fall of 1874?

A. In the latter part of the summer or fall of 1872, I went to work for the Harrisburg Foundry and Machine Company, of Harrisburg, and worked until 1873, just prior to the panic. I don't know just what month it was. I then went from there into the upper end of Cumberland county, and worked for my father, at cutting staves, for about a month or six weeks, and then bought a saw-mill in company with Mr. Kennedy, and ran that until the fall of 1874. I then sold my interest, and came back to Eberly's Mills.

Q. 27. During that time, to wit: From the time you left Waynesboro' 'till you returned to Eberly's Mills, in the fall of 1874, were you in Daniel Drawbaugh's shop occasionally or not?

A. I was. In the fall of 1872, and winter and spring of 1873, quite frequently.

Q. 28. How about the remainder of the time, from the spring of 1873 till the fall of 1874?

A. I was back and forward, but not so often. I got some little work done there for my mill, and done some myself—went there and done it.

Q. 29. Was Daniel Drawbaugh still working at his talking-machine during that period or not?

A. Yes, sir; I seen him working at it nearly every time I went into the shop, or every time. He had asked me at one time, if I sawed any black walnut that was real nice, that I should send him some. That he wanted it to make some of those instruments. He wanted it to make some nice ones, he said.

Q. 30. Please look at the instrument "A," now shown you, and state when and where you first saw it.

A. I saw it in that condition in the beginning of 1875, that I am positive of. I might have seen it when I first came there, but I am only positive of it, in that condition, in the beginning, or about January, of 1875.

Q. 31. Before seeing it in its present condition, had you seen it in any other condition? If so, what other condition? In what condition was it when you first saw it?

A. I don't know whether this is the one. It was one about this size and shape, with a magnet protruding at the bottom, and the mouth-piece being in the center, where the adjusting-screw now appears. I don't remember that adjusting-screw being in it at that time. By adjusting-screw, I mean the thumb-screw in the middle of the instrument, close to the mouth-piece.

Q. 32. When you saw it about the beginning of 1875, was it then in its present condition or not?

A. To the best of my recollection, it was in its present condition.

Q. 33. What was your uncle Daniel doing in the latter part of 1874 and beginning of 1875?

A. He was working there in the shop. About the most I seen him do was work on these instruments.

Q. 34. Was he doing any work for Wilson Bear and others connected with him, about that time?

A. He had contracted to do some work for them, but I done it about all, or nearly all of it, for him.

Q. 35. Did you know why he got you to do it for him?

A. They were pushing him for the work, and he was so much interested in his talking-machine that he did not get it done. He got me to do the work, I suppose, to give him more chance to work on his talking-machine.

Q. 36. Were you afterwards employed directly by the Axle Company?

A. Yes, sir.

Q. 37. When did you commence work for the Axle Company itself, directly?

A. I think it was on the 29th of March, 1875.

Q. 38. Have you any written memorandum or time-book, made at the time, showing when you commenced work for the axle company?

A. Yes, sir.

Q. 39. Will you please produce it and point out to the magistrate the entries referred to?

A. Unfortunately I have left it at home. I will bring it in the morning.

Q. 40. At the time when you went to work directly for the Axle Company, had they gotten into the shop their own machinery for doing their work?

A. Yes, sir; it was in and in running order, then.

Q. 41. About what time did they get that machinery in and ready for work?

A. It was not a great while before that, that it was ready for work.

Q. 42. Do you think it was in March, 1875?

A. Yes, sir.

Q. 43. On whose machinery did you and your uncle Daniel do that part of the work that was done before the Axle Company's machinery arrived?

A. On Hauck Brothers & Co.'s machinery, which was there in the shop at the time.

Q. 44. Please look at the instruments "D" and "E," now shown you, and state when and where you first saw them, or either of them.

A. I remember of seeing one of them, but I really could not say which one, as far back as January, 1875, and the other, a very short time afterwards, not more than ten days or two weeks. I remember of him working at the one very distinctly. The other I remember to have been finished, or what I supposed to be finished.

Q. 45. Was it the one that you first saw that was finished when you first saw it?

A. Yes, sir.

Q. 46. And do you mean that he was making the other within a short time after that?

A. What I meant to say was, that a short time after I saw the one finished, he was working at the second one.

Q. 47. Were they both completed before the Axle Company got its machinery in there or not?

A. They worked very satisfactorily, to my mind, some time before the Axle Company got its machinery in there.

Q. 48. Then you talked through them, or heard others talk through them, did you?

A. Yes, sir; I talked through them myself, and saw others at them. I mean, they were some distance from me, as I was working in the shop; but I could see others having them in their hands, and putting them to their mouths, and Dan showing them to them. I suppose they were talking through them, but I could not hear on account of the noise in the shop. I have often talked through them with my own mouth.

Q. 49. Did you listen at them while Mr. Drawbaugh, or anybody else, was talking through them?

A. Yes, sir; quite often. More especially, when they were first made.

Q. 50. Could you hear and understand what was said through them or not?

A. Yes, sir; quite distinctly, after the adjustment was proper once.

Q. 51. How long before you commenced to work directly for the company, March 29, 1875, do you think it was that you heard others talk through these instruments "D" and "E," and heard distinctly through them what was said?

A. To the best of my knowledge, it was about a month.

Q. 52. How long did you continue to work for the Axle Company directly, after March 29th, 1875?

A. A very short time; my books will show. I have the day and dates that I worked for them by the day. Then uncle Daniel, he contracted to make the axles by the piece or set. I sub-contracted with him for the manufacturing of them I continued then on, until, I think, in May, 1876. In the spring of 1876, I made some Centennial axles directly for the Company. I made them by the day. My book will also show the date when I began to work on the Centennial axles.

Q. 53. When did you begin to run the freight train for your uncle, Henry F. Drawbaugh?

A. In the latter part of October, 1876.

Q. 54. Do you know when he began to run those freight trains, or have you any idea how long they had been running when you commenced?

A. My supposition is that they commenced in the spring of 1876.

Adjourned until July 8th, 1881, at 10, A. M.

Examination resumed, pursuant to adjournment, at 10.25, A. M., July 8th.

Present, same counsel as yesterday.

Examination of H. K. Drawbaugh continued:

Q. 55. If there are any other instruments here in the room, which you saw Daniel Drawbaugh make or saw at his shop, before you commenced running on the freight trains for your uncle Henry, please point them out to the examiner. I mean any others, except those already testified to.

A. I think I saw him working at this one ["H,"] but it was not before I commenced running on the freight train that it was finished, to the best of my recollection. This I saw ["O"] while running on the road. "H" is the only one I remember of him working at before I commenced running on the road, and I don't think it was finished at that time.

Q. 56. What were you doing in the summer of 1876, after you left the shop and before you went on the railroad?

A. In reality, I was not doing much of anything.

Q. 57. Where were you living that summer?

A. I had my home at Eberly's Mills, but I was doing a great deal of running around. I helped my father a little while at Shiremanstown, putting up an elevator.

Q. 58. Do you remember when you finally stopped running on the freight trains, for your uncle Henry?

A. I think it was some time in March, 1877. I could not say positive as to the time. I ran some chance trips for their accommodation after that, when his son was wanting to get away.

Q. 59. Where were you during the summer of 1877?

A. I will recall that one answer about the time I stopped running on the train. I did stop in March, 1877, but went to work afterwards again, and worked up to the first of September, 1877, or about the first; it may have been the first week.

Q. 60. Then what did you do?

A. I then quit the railroad and went into the telegraph office at Newville, Cumberland county.

Q. 61. How long were you in the telegraph office, to the best of your recollection?

A. Till the beginning of May, 1878.

Q. 62. What did you then do?

A. I then went to Doubling Gap Springs Hotel.

Q. 63. How long did you stay there?

A. Till the latter part of October.

Q. 64. What did you then do?

A. I then came from the springs to Newville, and remained there about a month. From that I came home to Eberly's Mills, and remained a few days, and then went to Mechanicsburg to work for Hauck Brothers & Co., in the machine-shop. I worked for them until June, 1879. I then, in June, went back to Doubling Gap Springs, and remained there until about the middle of September. I then came home to Eberly's Mills, remained there a few days, and commenced working in Harrisburg here, where I have been working ever since.

Q. 65. What were you doing at the Doubling Gap Springs Hotel in the summers of 1878 and 1879?

A. I was clerking.

Q. 66. Please point out to the examiner any talking-machines here in the room which you saw at your uncle Daniel's shop, or saw him working upon, during the time that you were running on the freight train; that is to say, from October, 1876, to September, 1877, other than machines "A," "B," "C," "D," "E," "F," "G," "O?"

A. This machine here, ["H,"] I remember of him working at it, and I remember also of its being finished during that time, or I suppose it was finished. I saw it against the wall there, or the partition. I remember of him using the bell for an alarm, or for calling. At that time I was more interested in the new molasses faucet that he was getting up than I was in telephones. Nearly all our conversation, and nearly all my business, really, going in there, was pertaining to the faucet—while I was on the railroad. I also point out "G" and "O."

Q. 67. Did you ever talk through the machine "H," or hear him talk through it?

A. Yes, sir; I remember that very distinctly.

Q. 68. When was that?

A. It was during that time of running on the road.

Q. 69. Did your uncle Daniel ever say anything to you about patenting his talking-machine? If so, how often, and when first?

A. He spoke to me about it quite often. So far back as 1872, first. He said he would like to get some men to go in with him who would furnish money to get the patent and run the business. After I came to the city here to work, he often told me that I ought to know some one or be acquainted with some one who would take an interest in it—try and see some one. I mean after I came to the city in the latter part of

EPHONE COMPANY,-1

1872. I know I never spoke to any one concerning it, except to Mr. William Stees, who was killed a short time ago. I have known him from boyhood. To the best of my recollection, I did not say anything more to him than tell him of the instruments he was working on—what his intentions were.

Q. 70. Prior to the time when your uncle made the magneto instruments, "D" and "E," about the beginning of 1875, how many tumbler instruments like "F" had you seen at his shop?

A. He had several sitting around there.

Q. 71. How many had the bottom broken off or removed, like the instrument "F"?

A. I don't remember more than that one.

Q. 72. Do you have any recollection of an instrument, which he made at a very early day, in which he used a cup instead of a tumbler?

A. No, sir; I do not. There were a great many cups and tumblers sitting around there that he really used, but I can't just remember the time. I remember of cups being there.

Q. 73. Did you ever assist him in making any of the parts of these talking-machines, or any of them?

A. Yes, sir; quite frequently.

Q. 74. At how early a time?

A. I might say from 1870 down to 1876. I would go into the shop quite often, and he would say, "Here, take this and make it for me; it won't take but a few minutes," and may be it would take a half day. That is the way he would get me to work for nothing.

Q. 75. During the period from 1870 down to the beginning of 1875, I want to know whether or not he was making and testing other forms of talking-machines that have not been preserved. What do you know about that?

A. I know of him having machines there that I have not seen lately. I don't know whether they have been preserved or not. One, in particular, was on a very large scale. I knew at the time that he was merely making an experiment. He told me at the time, too, that it didn't work. It was about the time I came from Waynesboro', about the latter part of the summer of 1872. The reason for my remembering that is, he made it out of a box or case that he had made a musical instrument of in his boyhood days, and I was very much taken up with the instrument. I used to amuse myself a good bit on it—that is, the musical instrument. Of course, I was not so well pleased at that time, to see it converted into a talking-machine.

Q. 76. Do you know anything about his experimenting during those years, on different forms and materials for diaphragms for his talking-machines?

A Yes, sir; very often.

Q. 77. Do you know anything about his experimenting, during those years, upon different materials to be used with, or instead of, the plumbago, which he used in his talking-machines?

A. I remember of him working and changing his batteries. I don't know whether it was separate from the plumbago, or whether it was to be used in connection with it; I know he was trying a great many different things in connection with it.

Q. 78. Have you any recollection of his experimenting with pulverized clay, or dry earth, or pulverized stone, or metal filings, in connection with his talking-machines?

A. I remember of him using clay and prepared iron filings, but I don't remember of him using pulverized stone.

Q. 79. Do you remember how long ago it was that he used the clay and prepared iron filings?

A. I think it was during my time of working there, to the best of my recollection—from the latter part of 1874 until 1876.

Q. 80. When you used to assist him in talking through the machines, or listening to his talk, where would the machines be that were used for talking and listening—in what parts of the shop, and on what floor or floors?

A. They were very often changed, so far as parts of the shop were concerned, but hardly ever from one floor to another. They were generally on one floor.

Q. 81. On what floor were they principally used?

A. Counting the basement or cellar as a floor, there was generally one in the basement or cellar, and the other on the third floor.

Q. 82. How were the instruments in the cellar and on the third floor connected?

A. By means of wires.

Q. 83. How did these wires run in the shop, and how were they supported?

A. They generally ran along the joists till they got to the wall, or close to the wall; he generally run them down in a corner.

Q. 84. Were those wires taken down and put up every time he wanted to use the talking-machine, or did they remain permanently attached to the wall and joists?

A. They were never taken down, to my recollection.

Q. 85. When did you first see them up?

A. I first saw them up, as I thought, permanently, in 1874. I have seen them changed some since, on account of making additional rooms in the shop, but not materially changed; have used other wires in different directions—taking them out of the shop; I mean, when he took the one instrument up the creek a short distance there for trial.

Q. 86. Do you remember a line of wires run out at one time to or over the hill near the north-west end of the building?

A. Yes, sir.

Q. 87. Did you see any tests of the talking-machine made on that last mentioned line?

A. No, sir; I did not. I remember of seeing the wires up, though.

Q. 88. Referring to the wires, which ran from the third story to the cellar or basement, when did you last see those wires up?

A. I don't think I have seen them since 1879.

Q. 89. Do you know whether they were taken down then, or whether they are up now?

A. I do not. I have since that talked through telephones there that were in a different place; but I don't know whether those wires are there now or not.

Q. 90. Referring to those wires that ran from the third story to the cellar, what, if any, use was ever made of them, besides their use for the talking-machine?

A. I think they were used for running one of those clocks at one time.

Q. 91. When was that?

A. That was in 1871, I think, that the clock was first made—the first one to the best of my recollection. It might have been before that time.

Q. 92. I understood you to say that you first saw that line of wires in 1874. Does your recollection now go back to an earlier date for them?

A. Yes, sir; in 1869, I remember of the big clock being bought from Mr. W. L. Gorgas, while he was foreman of the shop. It might have been in 1868, but I know that it was while he was foreman. I think he was foreman in 1868 and 1869. Daniel Drawbaugh ran his instrument. Of course, I was not so well pleased at that time, to see it converted into a talking-machine.

Q. 76. Do you know anything about his experimenting during those years, on different forms and materials for diaphragms for his talking-machines?

A Yes, sir; very often.

Q. 77. Do you know anything about his experimenting, during those years, upon different materials to be used with, or instead of, the plumbago, which he used in his talking-machines?

A. I remember of him working and changing his batteries. I don't know whether it was separate from the plumbago, or whether it was to be used in connection with it; I know he was trying a great many different things in connection with it.

Q. 78. Have you any recollection of his experimenting with pulverized clay, or dry earth, or pulverized stone, or metal filings, in connection with his talking-machines?

A. I remember of him using clay and prepared iron filings, but I don't remember of him using pulverized stone.

Q. 79. Do you remember how long ago it was that he used the clay and prepared iron filings?

A. I think it was during my time of working there, to the best of my recollection—from the latter part of 1874 until 1876.

Q. 80. When you used to assist him in talking through the machines, or listening to his talk, where would the machines be that were used for talking and listening—in what parts of the shop, and on what floor or floors?

A. They were very often changed, so far as parts of the shop were concerned, but hardly ever from one floor to another. They were generally on one floor.

Q. 81. On what floor were they principally used?

A. Counting the basement or cellar as a floor, there was generally one in the basement or cellar, and the other on the third floor.

Q. 82. How were the instruments in the cellar and on the third floor connected?

A. By means of wires.

Q. 83. How did these wires run in the shop, and how were they supported?

A. They generally ran along the joists till they got to the wall, or close to the wall; he generally run them down in a corner.

EPHONE COMPANY,-1

Q. 84. Were those wires taken down and put up every time he wanted to use the talking-machine, or did they remain permanently attached to the wall and joists?

A. They were never taken down, to my recollection.

Q. 85. When did you first see them up?

A. I first saw them up, as I thought, permanently, in 1874. I have seen them changed some since, on account of making additional rooms in the shop, but not materially changed; have used other wires in different directions—taking them out of the shop; I mean, when he took the one instrument up the creek a short distance there for trial.

Q. 86. Do you remember a line of wires run out at one time to or over the hill near the north-west end of the building?

A. Yes, sir.

Q. 87. Did you see any tests of the talking-machine made on that last mentioned line?

A. No, sir; I did not. I remember of seeing the wires up, though.

Q. 88. Referring to the wires, which ran from the third story to the cellar or basement, when did you last see those wires up?

A. I don't think I have seen them since 1879.

Q. 89. Do you know whether they were taken down then, or whether they are up now?

A. I do not. I have since that talked through telephones there that were in a different place; but I don't know whether those wires are there now or not.

Q. 90. Referring to those wires that ran from the third story to the cellar, what, if any, use was ever made of them, besides their use for the talking-machine?

A. I think they were used for running one of those clocks at one time.

Q. 91. When was that?

A. That was in 1871, I think, that the clock was first made—the first one to the best of my recollection. It might have been before that time.

Q. 92. I understood you to say that you first saw that line of wires in 1874. Does your recollection now go back to an earlier date for them?

A. Yes, sir; in 1869, I remember of the big clock being bought from Mr. W. L. Gorgas, while he was foreman of the shop. It might have been in 1868, but I know that it was while he was foreman. I think he was foreman in 1868 and 1869. Daniel Drawbaugh ran his first electric clock from his large clock, and that was the time the wires were first put down to the earth, either in the cellar or outside of the shop.

Adjourned until 2, P. M., for dinner.

Examination of H. K. Drawbaugh resumed, at 2, P. M., pursuant to adjournment.

Present, same counsel.

Q. 93. How long was that line of wires used for the electric clock, if you remember?

A. I think they used it up to the present time, or until his present clocks were taken down. Those, I think, were the first wires used.

Q. 94. Did not the use of the wires for the talking-machines interfere with their use for the clock?

A. There was a small copper wire run from the talking-machine to these wires, and my impression was, that the clocks were disconnected from the wires at the time of the experiment or trial. Since that time, I know of him putting up other wires for the talking-machine, or telephone, alone

Q. 95. At the time of what experiment or trial?

A. At the trial of machine "B," about my first trial with it. He did not have much wire at that time, either.

Q. 96. Since that time, what other lines of wire have been put up there, and when, as near as you remember?

A. There have been a great many wires put up there since the fall of 1872 that I remember of; but they never remained long at one place. They were moved from time to time. The only one that I remember of helping him to put up was some time in January, 1875. We run that one from the third floor to the garret, or fourth floor, and wound it back and forward several times from one end of the building to the other, to gain length or distance, and then took it from there to the first floor or cellar.

Q. 97. What was that line put up for?

A. It was put up for those two machines there, with curled magnets, "D" and "E."

Q. 98. Were they used in connection with that line?

A. Yes, sir.

Q. 99. Where did Daniel Drawbaugh get his small wire that he used in connection with his talking machines?

A. That is more than I am able to say. I don't know that I ever asked him. His quite small wire, that he used on the small magnets, I helped him to make myself, out of heavier wire. We pulled it, or drew it.

Q. 100. When he used the small magneto machines, "D" and "E," did he use them with batteries, or without?

A. He used them with batteries at that time.

Q. 101. At what time?

A. That was the time we first tried them.

Q. 102. Did you ever see them used without batteries?

A. I spoke through them quite often. I could not say it was without a battery. He would often come to me, or hallo at me in the shop, to go down to the cellar and talk a few words in—that he wanted to try something. At those times I would not know how he had it connected, or anything else, or what he was doing. He would still answer me when I talked in, and tell me to hold it a little farther away from my mouth, or a little closer, and then would ask me the distance I had it, or was speaking from. I would tell him, and he would say "all right," and I would go back to my work; and that would be the last I would see of it, until he would call me again, which, some days, would be pretty often.

Q. 103. Do you recollect ever seeing the machine "B" used with two diaphragms, namely, one at each end of the tin box?

A. No, sir; I don't, not to my recollection.

Q. 104. Did you ever see the machines "G" and "O" used for talking through?

A. I never used them for talking through. I have seen them connected with wires, but have never spoken through them, that I remember of.

Q. 105. What kinds of batteries did your uncle use in connection with his talking-machines?

A. The batteries that he used then were what we would commonly call the Morse battery. I think that is what he told me—that they were made on that principle. But he tried a great many different kinds, I know.

Q. 106. If I understand you correctly, you were in his shop while the Electric Clock Company were carrying on their operations there, in 1878. Am I right?

A. I was, but very seldom.

Q. 107. Did you see any talking-machines there during that time?

A. I did see some sitting around there,—yes, sir.

Q. 108. Did you see him doing anything with them, or at them?

A. My visits to the shop then were confined to a few minutes, just merely between passenger trains, as I was employed away from home during all that time, and did not have any time to spare.

Q. 109. Do you remember how the line wires were attached to this machine "F," when it was in use?

A I don't know whether I can describe that now, or not. There was one that came out of the center of it—a small wire. To the best of my recollection, there was a bar across the top here, and a wire that came up through the center, through that bar—that the wires were attached. It has been so long since I took particular notice of this. My impression is that the wire coming up through the center was with the intention of raising or lowering a plate that he had there. I can't remember distinctly.

Q. 110. I now show you an instrument, which I mark for identification "instrument 'F' reproduced," and ask you to open it and examine it, and see whether you remember a tumbler instrument like that or not.

A. This conveys the impression I had of an adjustment for raising or lowering. I knew there was something of that kind. I remember a tumbler instrument like that,—yes, sir.

[*Complainants' counsel objects to the designation of the exhibit by a phrase which assumes to be a statement of an alleged fact.*]

Q. 111. When did you first see an instrument like this ["F reproduced"]?

A. In 1870. It might have been before that, but I am positive I saw it at that time.

Q. 112. This instrument has a wooden cup supported by a stout wire, the ends of which run through the wooden cover that fits on the end of the tumbler, the wooden cup hanging inside the tumbler when the cover is in place. Do you remember that wooden cup at that time?

A. I remember of a cup being in. I couldn't say whether it was wooden or not. I never took particular notice, that I remember.

Q. 113. Look at the shape of the cup of this instrument and see how it compares with the cup that you remember.

A. In my impression, it is about the same.

Q. 114. Inside of the wooden cup of this instrument is a metal plate rigidly connected to the center of the metal diaphragm by a metal rod. Have you, or not, any recollection of such a device in your uncle's talking machines, and if so, when first?

[*Objected to as leading and incompetent.*]

A. I remember of those rods being in that tumbler, but I can't remember just the connections or constructions any more. So far as those diaphragms are concerned, I saw them made of different metal and of different shapes, from 1870 up to the present time, in the shop.

Q. 115. You say you remember those rods. Do you include the rod running from the middle of the diaphragm down towards the middle of the cup—do you remember that, or not?

A. The only distinct recollection I have is of the adjustment of what I supposed to be that cup. He used the rods for that.

Q. 116. Do you remember why he adjusted the cup—did you understand why, at the time?

A. I don't remember—nothing more than that I supposed it had to be in a certain place before the instrument would work—do what he wanted it to do.

Q. 117. At the time your uncle Daniel made the second small magneto instrument, in the beginning of 1875, did you do any work on it?

A. Yes, sir; I done a good bit of work on it for him.

Q. 118. Do you remember what you did on it?

A. Yes, sir; my impression is, I made the whole thing—very near all of it.

Q. 119. Do you know which of the two instruments, "D" and "E," you worked on?

A. I worked on instrument "D" the most. I done some work on "E," too.

Q. 120. Which is the one that was made before you went to work for him in January, 1875?

A. This is the one, I think, ["E"] he made first. He first made them very temporary.

Q. 121. What work did you do on the instrument "E," which was made before you went to work for him?

A. The parts he had made, he had made very roughly, and while he was making the wood parts of it, he got me to make the other parts, so that, I might almost say, I made the whole instrument. He took it out of the case it had, and made a new walnut casing for it.

Q. 122. Then the instrument was substantially made over again, at that time, was it?

[*Objected to as leading and incompetent.*]

A. It was what I would term reproduced, in order to make it look more respectable.

Q. 123. After it was so reproduced, did you immediately go to work on the other instrument, " D, " or not?

A. Yes, sir; I went to work on it right away, or a very short time afterwards. I was working for him at that time.

Q. 124. There is no cover over the bottom of instrument "D;" did it ever have one or not?

A. I think it did.

Q. 125. There is a small round hole in the bottom cover of instrument " E, " and through the inner end of the curled magnet. What was that hole for?

A. It was first intended for a screw. It had a screw in it at one time.

Q. 126. In the same manner as " D " now has?

A. Yes, sir; one like it.

Q. 127. Did your uncle direct you in your work on those two instruments?

A. Yes, sir; he merely made a small draft of it on a small piece of paper or envelope, I forget now which, and he would tell me from time to time while I was working at it how he wanted it, and I would ask him about it.

Q. 128. Do you recollect whether there was any particular design in not making the instruments exactly the same shape?

A. I remember of there being a difference in the machines, but I could not tell to exactness the difference in the measurements, or anything of that kind, any more. I don't know whether there was a design in making them different or not. I remember of him telling me, but I could not just tell you any more.

Q. 129. With the exception of the removal of the bottom screw from one, and the bottom cover from the other, are those two instruments, "D" and "E," in the same condition now that they were in, when first finished in the early part of 1875, or have they been changed in any way?

A. They have not been changed in any way that I can see.

Q. 130. I want to know whether you could or could not, from your own, unaided memory, and without having either of the machines "D" and "E" before you, have reproduced substantially similar machines, at any time from January or February, 1875, down to the present time?

[*Objected to as incompetent.*]

A. I could have, except in size or caliber. I don't suppose I could have got them exactly the sizes of those. I would have had to make them entirely from my memory of the work on those. I did everything except put the insulated wire on. I did not do that.

Q. 131. Who made the curled magnets for those two machines, if you know?

A. He made the one for the first one, and forged it, and shaped it, and I made the other, I think. There were several—quite a number of them made, and I know that Fettrow made a couple, but I don't know which of them were used.

Q. 132. What was your uncle Daniel Drawbaugh's financial condition, so far as you know, from 1870 down to 1879?

A. I always thought he was poor.

Q. 133. Do you know whether or not his work upon his talking-machines met with opposition on the part of his family, or relatives, or any of them?

A. It met with a very decided opposition on the part of his family; I might say, with all persons he came in contact with, concerning the talking-machine.

Q. 134. What did your father used to say about it?

A. I used to hear him tell him he had better go to work at something that would make him some money, so that he would not be always out of money.

Q. 135. Do you know whether your uncle Daniel was accustomed to show your father his new talking-machines, and what he was doing with them, or not?

A. My impression was then that he tried to keep them away from him, on account of him always discouraging him.

Q. 136. Do you see any machines here on the table that you remember doing any work on for your uncle Daniel, after you finished the two magneto machines, "D" and "E?"

A. No, sir; not in particular. I remember doing little dribs of work for him once in a while afterwards, but it was so trifling that I don't remember which machines it was for.

Q. 137. From all you know of your uncle Daniel's work, of your own knowledge, from 1870 down to 1880, did he, or did he not, ever lay his talking-machine invention aside, and give it up, or give up working upon it, during that period?

A. No, sir; I don't think he ever did. I have known him to work at other work during the day. I have known him then to work on his talking-machine 'till eleven or twelve o'clock at night and sometimes 'till two o'clock in the morning.

Q. 138. From all you know by your own personal observation, what was it that principally engrossed his study and labor during that period from 1870 to 1880?

A. I was under the same impression, as nearly every one else that knew him, that it was the talking-machine.

Cross-examined by Mr. Storrow:

Cross-Q. 139. Did your father ever work in the shop at Eberly's Mills?

A. Yes, sir; he did.

Cross-Q. 140. When did he work there?

A. He worked there first when the Drawbaugh Manufacturing Company first started up in the shop. He done the mill-wrighting work; then put in the fore-bay and water-wheel; and put in some of the line shafting, and worked on the general repairing of the building, when they converted it from a clover-mill into a machine-shop. That was in 1867, I guess. It was when they first fixed the shop.

Cross-Q. 141. He worked there between 1870 and 1880, did not he, also?

A. He did some, but very little while I was there.

Cross Q. 142. How long has he lived at Eberly's Mills?

A. He was born and raised there, and has lived there ever since.

Cross-Q. 143. You haven't got any house and family of your own, have you?

A. No, sir.

Cross-Q. 144. When was it that you knew of your uncle Daniel working till midnight, or later, on his talking-machine?

A. It was during all the time that I was there, from 1870 till I went away in 1872, and then from when I came back in 1874 till I left in 1876.

Cross-Q. 145. Do you mean that he did it occasionally during that period, or that it was a pretty constant habit of his?

A. It was a pretty constant habit of his. I might say that it was every night,—that he was well enough to go to the shop.

Cross-Q. 146. Were you ever there in the shop nights when he was working on the talking-machine?

A. Yes, sir; very often.

Cross-Q. 147. Did you ever meet anybody else there when he was working on the talking-machine at night?

A. Yes, sir; it was a kind of a loafing place for some of us young men. We would go there at night and play "seven-up" sometimes. Then at different times I would meet men out of the village, just right around home, you might say.

Cross-Q. 148. Whom did you ever meet there out of the village nights, when he was working on the talking-machine?

A. I remember of meeting Mr. Fettrow, Mr. Carl, Mr. Holsinger, Mr. Rowe, and a number. I don't just remember who all I met. As a general thing they did not get in 'till I came down. If he got in first he would lock it, and then they could not get in unless some one came who had a key, like me. He never would let them in if they made a noise.

Cross-Q. 149. When did you last see the instrument which you have testified, in your one hundred and eleventh answer, was like the exhibit "F, reproduced"?

A. I really can't tell when last I saw it. I saw it nearly every time I went into the shop, or every time.

Cross-Q. 150. How late do you recollect having seen it?

A. I remember very distinctly of seeing it in 1876, fall and winter. He always had a place that he kept it, as a general thing, until Mr. Chellis took hold of the shop and made changes on the floor there, tore his shelving down and made other changes. I don't remember of seeing it since that.

Cross-Q. 151. Have you made an affidavit about these instruments, or any of them, within the last year?

A. No, sir.

Cross-Q. 152. Did you see any of these instruments during 1880?

A. Yes, sir.

Cross-Q. 153. Where?

A. I don't think that I seen them at any other time than when I gave in my affidavit.

Cross-Q. 154. When was that?

A. To the best of my recollection, it was on the 9th of July, 1880. When I answered the one hundred and fifty-first question, I thought to-day was the 15th of July. I had the impression on my mind that the Fourth of July was a week ago last Monday.

Cross-Q. 155. Where did you see them then?

A. I saw them in Washington.

Cross-Q. 156. Did you then see in Washington all that have been shown you in the course of your deposition?

A. No, sir; not to the best of my recollection.

Cross-Q. 157. What ones did you see then?

A. I remember seeing "B." My mind is very indistinct about that time, because I was very sick at the time, and was sick for two weeks after I returned. I remember of them showing me several instruments there, but I paid so little attention to them, on account of feeling so sick. I think they showed me instrument "A." There might have been a couple more, but I would not like to say.

Cross-Q. 158. What inventions, models, or machines of your uncle Daniel's did you ever know of besides talking-machines?

A. A stave-cutter, stave jointer—the stave-cutter was a stave-cutter header and shingle machine combined—a barrel-head rounding-machine, a mill burr-tram, for leveling or tramming mill-burrs, a carrier, rine, and driver for mill-burrs, a carpet-tack machine, a device or machine for feeding nail-plate. He got up a gas governor at one time. I don't know whether it was ever patented, or not. A hydraulic ram for lifting and forcing water. I believe that is all I can think of now.

Cross-Q. 159. Did you ever have any talk with him about telephones made by any person other than himself?

A. No, sir; not until after we heard of the Bell telephone.

Cross-Q. 160. When did you have a talk with him about the Bell telephone?

A. My first recollection of it is in the second season that I was at work at Doubling Gap Springs. It was the beginning of June, 1879; I

EPHONE COMPANY,-1

came down from there to fix the jets of the fountain. I brought them down and did the work in the shop. We then spoke about it, and he told me then, "I know that I am away ahead of him." He said, "If I had had the means to go ahead, I would have had it out long before he got it out."

Cross-Q. 161. Where did you work as a telegraph operator?

A. At Newville, Cumberland county.

Cross-Q. 162. What office?

A. Cumberland Valley Railroad office. I was not employed directly by the railroad company. Mr. Byers had the ticket office and freight office. He is agent there, and had to employ from two to three men besides himself.

Re-direct by Mr. Hill:

Q. Q. 163. I forgot to ask you to produce the memorandum book in which were the entries of your work for the Axle Company and your work on the Centennial axles. If you have it here, please produce it, and point out the entries to the examiner, in order that he may copy them upon the record.

A. Here it is, and these are the entries: "Commenced work for axles March 29."

[*Witness says there is no date of the year, but it was in* 1875.]

[*The account shows work every day through the remainder of March, and the whole of April. There are also some memoranda of axles delivered to customers of the Company in December,* 1875, *and January, February, and March,* 1876.]

Another entry in the latter part of the book is:

"*Work on Centennial March* 28." (*Witness says:*) That is the date I began work at the Centennial axles, and it was in 1876.

[*The book is a small pocket memorandum book with the covers torn off, and witness says:*]

It is the book in which I made my original entries, which I copied into a larger book, which I have lost.

Examination taken, reduced to
writing, and by the witness af-
firmed and subscribed to before
me, this 8th day of July, 1881.
FRED. M. OTT,
Examiner.

H. K. DRAWBAUGH.

Adjourned until July 9th, 1881, at 10 o'clock, A. M.

July 9th, 10.30, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

S. S. RUPP, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

I am twenty years old; Shiremanstown is my post-office; I am a teacher. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa. I met him just about three weeks ago. I saw him several years ago, but was never formally introduced to him until recently.

Q. 1. State the circumstances attending your first visit to Mr. Drawbaugh's shop.

A. I was attending the school taught by Mr. Hamaker, sometimes called Frogtown school, and sometimes called Cedar Spring school. We visited the school taught by Mr. Strong, situated in the next district, sometimes called Cedar Run school. Some people call it the Gorgas school. These two schools are known by different names to different people. Nearly every one has his own name for it. After our visit to Mr. Strong's school, we went to Milltown, also called Eberly's Mills. We visited Daniel Drawbaugh's machine-shop and stayed there about an hour. While at the machine-shop, Mr. Drawbaugh spoke about a machine that he had that he called a talking-machine, or speaking-machine. I did not pay much attention to his explanation of the machine. I was interested in something else, and paid attention to the things I was interested in. I was interested particularly in a turning-lathe, on which was placed a patent axle. That is about all I remember about the machine-shop. After that we started for home.

Cross-examination waived by Mr. Storrow.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 9th day of July, 1881.
FRED. M. OTT,
Examiner.

S. S. RUPP.

Adjourned for want of witnesses until 2, P. M.

Examination resumed, pursuant to adjournment, at 2, P. M.

Present, same counsel.

DAVID M. DITLOW, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is thirty-five; residence, Camp Hill, Cumberland county, Pa.; occupation, drover. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa. I have known him for twenty-five years.

Q. 1. Did your father at one time live near Eberly's Mills?

A. Yes, sir.

Q. 1½. How far from Daniel Drawbaugh's shop did he live?

A. A short half mile.

Q. 2. When did he move away from there?

A. April, 1875.

Q. 3. How long had he lived there at the time that he moved away?

A. Twenty-five years.

Q. 4. Did you live in your father's family until he moved away from Eberly's Mills?

A. Yes, sir.

Q. 5. When did you first know of Daniel Drawbaugh's talking-machines?

A. Nine years ago—about 1872.

Q. 6. How came you to know about them at that time?

A. I came to the shop there, and he showed me a machine, with tin tubes at each end, and a wire wrapped with string.

Q. 7. Did you talk through it, or hear anybody talk through it, at that time?

A. Yes, sir; I listened and heard Mr. Drawbaugh talk through it.

Q. 8. Could you understand through the machine what he said?

A. Yes, sir.

Q. 9. From that time until your father moved away, how often do you think you were in Mr. Drawbaugh's shop?

A. I would not know how often, but I have been there, I guess, twice a week, back and forward.

Q. 10. From the time your father moved away, down to 1880, how many times have you been there?

A. I might have been there once a month.

Q. 11. From the time when you first saw the machines, in 1872, down to the time your father moved away, how often did you see

Mr. Drawbaugh working at, or experimenting, with his talking-machines?

A. All the time—whenever I was in there—he was working at them all the time.

Q. 12. During that time, did you see other talking-machines that you did not see in 1872, when you first talked through them?

A. No, sir.

Q. 13. What did you see him working on, when you so often saw him working on talking-machines?

A. I saw him working on wires, and tin, and wood, and other things. I can't answer that question;—I can't tell you.

Q. 14. But you understood that this work was on the talking-machine, did you?

A. Yes, sir.

Q. 15. From the time when your father moved away, down to the year 1879, did you ever see him working on the talking-machine?

A. Yes, sir.

Q. 16. How often?

A. About two or three times.

Q. 17. I showed you in Mr. Jacobs' office, a little while ago, the various instruments that have been used in evidence here. Were you able to recognize any of them as the particular instruments that you saw Mr. Drawbaugh working upon?

A. No, sir.

Cross-examination waived by Mr. Storrow.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 9th day of July, 1881.

FRED. M. OTT,
Examiner.

DAVID M. DITLOW.

Adjourned until Monday, July 11th, at 10 o'clock, A. M.

EPHONE COMPANY,-1

Monday, July 11th, 1881, 10 *o'clock*, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

J. B. DRAWBAUGH, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

I am sixty-five years of age; I reside at Eberly's Mills, Cumberland county, Pa.; I am a mill-wright and machinist. I am a brother of Daniel Drawbaugh.

Q. 1. Did you do any work for the Haucks, while they were running the faucet business at the old shop or mill occupied by your brother Daniel, at Eberly's Mills?

A. Yes, sir.

Q. 2. When did you begin to work for them, and when did you quit working for them?

A. I commenced working for the Haucks on the 19th of July, 1873. I quit on the 2d day of July, 1874.

Q. 3. Do you know how long the Haucks ran the business there at that shop after you quit?

A. No, sir; not exactly. They did not run it a long time after I quit.

Q. 4. During the time from July 19, 1873, to July 2, 1874, did the work of the Haucks go on regularly there, or were there intervals when there was no work done?

A. There was intervals that there was no work done at different times.

Q. 5. When they closed up there, what did they do with their machinery in the shop?

A. They removed part of it to Mechanicsburg; the rest of it remained in the shop.

Q. 6. Did you do any work for the Axle Company while it was in operation there at the shop?

A. Yes, sir.

Q. 7. When did you commence work for the Axle Company, and when did you quit working for them?

A. I commenced work for them on the 16th day of March, 1875. I quit—the last work that I done for them was on the 20th day of April, 1875.

Q. 8. Was that all the work that you did for the Axle Company?

A. Yes, sir.

Q. 9. State whether you have fixed these dates, showing the beginning and end of your work for the Haucks, and the beginning and end of your work for the Axle Company, by means of your old account-books, here present?

A. Yes, sir.

Q. 10. Were the entries which you refer to in fixing the dates, made in those books at the time when the work was done?

A. Yes, sir.

Q. 11. Will you please produce the books, and point out the entries to the examiner, in order that he may copy them on to the record?

A. Yes, sir; here is the Hauck Brothers & Company's.

[*Account commences.*]

Q. 12. I observed that when you were entering up these accounts in the book, and turned over from page one to page two, to commence the entries on page two, you made your first entry on page two as "April 26th, 1874." Is that month and year right, or were they so entered by some mistake?

A. No, sir; they are not correct—it is a mistake. The date of the year should have been 1875. That is an error I have not discovered all this time. 1875 is the right year, and the month, April 26th, is a mistake. It should be March 26th, agreeing with the account on the other page. I made that mistake on adding up the work done to March 26th, and starting a new page. It should have been March.

Q. 13. Were you in the habit of putting down your day's work, from day to day, in that book, as you did the work?

A. Yes, sir.

Q. 14. Do you think you footed up the first page on the 26th of March and carried the balance over to the next page on that day, or may you have carried that footing over to the next page, on or after the 20th day of April, when you closed your work?

A. I would answer that in this way; My usual way is to carry the amount over to the next page when I make the next charge, and I suppose I done that when I made the next day's charge.

Q. 15. Do you recollect anything about this particular instance?

A. No, sir.

[*Mr. Hill asks the magistrate to certify that the account-book against the Hauck Brothers shows that from the* 16*th of March,* 1874, *to the* 26*th day of April,* 1874, *inclusive, the witness worked every day of that time for Hauck Brothers, doing in the time mentioned thirty-one days' work, less three hours. On examining the account, the examiner so certifies.*]

Q. 16. Was that work in March and April, 1875, all the work you did for the Axle Company?

A. Yes, sir; that I recollect of.

Q. 17. When you went to work for them, March 16th, 1875, did they already have their new machinery in the shop?

A. Yes, sir.

Q. 18. What was the character of the first work that you did for them there, as charged in that account?

A. In lining up with boards the inside wall of the shop.

Q. 19. From July 2d, 1874, when you quit the Hauck Brothers, to March 16th, 1875, when you went to work for the Axle Company, what were you working at, and where?

A. I was working at mill-wrighting. I worked some part of the time at Mr. Oyster's mill, and worked around at different places.

Q. 20. Were you in your brother Daniel's shop much during that time?

A. I was there frequently.

Q. 21. Did you do any work for the Electric Clock Company, when they had their works in your brother's shop, from the spring of 1878 to the spring of 1879?

A. No, not that I recollect.

Q. 22. Did you do any work for Mr. Chellis, after he commenced the faucet business there?

A. Yes, sir.

Q. 23. How much, and what?

A. I put up some shafting for him, and pulleys.

Q. 24. Did your brother Daniel ever show you any talking-machines?

A. Yes, sir.

Q. 25. Do you remember the time when he first showed you a talking-machine?

A. Yes, sir.

Q. 26. How near can you fix that time?

A. I would not like to fix any date nearer than some time inside of twelve months. It was some time before I went to work for the Haucks, and may have been the latter part of 1872 or some time in the beginning of 1873.

Q. 27. Did you talk through the machine, or hear anybody talk through it, at that time?

A. Yes, sir; I talked through the machine.

Q. 28. Describe all that took place at that time, when you were first talking through the machine.

A. I came to the shop and Daniel asked me to talk into the machine, that he wanted to adjust something about the machine, I don't recollect whether he said what. I then talked in the machine, saying that Harrisburg was the capital of Pennsylvania, Washington city the capital of the United States of America, and Carlisle the county seat of Cumberland county. I talked something else, not recollecting exactly the words that I spoke. He then came around to me, and told me to sing in the machine, commencing with a low tone of voice and increase to a loud tone. I done so.

Q. 29. Do you know whether he heard what you said when you talked into the machine?

A. Yes, sir; I asked him whether he understood me, and he said he did. He said then to me, "You said that Harrisburg was the capital of Pennsylvania, that Washington was the capital of the United States of America, and that Carlisle was the county seat of Cumberland county."

Q. 30. Did he make any adjustments of the machine during that conversation?

A. Yes, sir.

Q. 31. Please look at the machines now here present, and see if you observe among them the talking-machines with which that conversation was carried on.

A. I can't exactly tell. The machine that I talked through stood on a table. It had a mouth-piece something similar to that, [indicating "F,"] or to this, [indicating "M,"] but I could not positively say whether I talked into this machine "F," or one like it, or this machine "M," or one like it. I only remember that it had a mouth-piece on the top. I remember well that he came around and took the top off of the machine and done something to it, but I did not take notice what. I then spoke a few words of something, not recollecting what. I then commenced singing. I sang "Yankee Doodle" for him, commencing in a low tone of voice, and increasing to a loud tone. I can't particularly say what machine he listened at, whether it was this machine "C" or "B," or machines like them, as I don't remember of being around in the room where he was listening at that time, at all.

Q. 32. Do you recollect ever seeing this machine "I" in his shop?

A. I saw this machine in his shop, but I am not able to say when.

Q. 33. Did you see it there before you went to work for the Hauck Brothers?

A. I think I did, but I would not say positively that I did.

Q. 34. Do you recollect seeing this machine "C," or a machine like this machine ["C reproduced"] in his shop?

A. Yes, sir; I saw this machine there, or one like it, [indicating both machines.]

Q. 35. Can you fix the time when you first saw them?

A. No, not particularly.

Q. 36. Do you remember whether you first saw them before or after you commenced working for the Hauck Brothers?

A. I saw them before and after, and during the time that I was working there.

Q. 37. Did you ever see these machines "B" and F"?

A. Yes, sir.

Q. 38. When, first, so far as you recollect?

A. I saw them machines in 1869, or some like them. I would not like to say that those were the machines. There might have been some made afterwards.

Q. 39. How came you to see them at that time?

A. I seen the machines at that time. I was away from home doing the work of a new mill, located about twelve miles north-west of Carlisle. On a visit home to my family, I went to the shop. I saw them machines, with some others, on a work-bench and in a cupboard that was there.

Q. 40. Was there any talking through the machines at that time when you first saw them?

A. I don't recollect that I did, just at that particular time. There was some talking done, that I recollect of, during that year by other ones.

Q. 41. You say, in one of your answers, that your brother Daniel first showed you the talking-machine within twelve months before July,

1873. Do you mean now that you saw the talking-machines there before he showed them to you?

[*Objected to as leading and argumentative.*]

A. I do.

Q. 42. Whose mill were you working on in 1869, twelve miles north-west from Carlisle?

A. Thomas Stanton's.

Q. 43. What kind of a mill was that?

A. It was a flouring-mill, or grist-mill, sometimes called a merchant-mill.

Q. 44. On what stream was that mill situated?

A. On the Conedoguinit creek.

Q. 45. Have you any book entries here that show when you commenced doing the work on Stanton's mill?

A. Yes, sir.

Q. 46. Were those entries made at the time when you did the work?

A. Yes, sir.

Q. 47. Please produce the book and point out the entry to the examiner, in order that he may copy it on to the record.

A. Here it is.

[*Witness produces a book, which shows an account with T. G. Stanton, commencing April,* 1869, *and running to January,* 1870.]

Q. 48. Was your son, George W. Drawbaugh, employed on that work on Stanton's mill? If so, from what time to what time, as shown by your book?

A. Yes, sir.

[*The account shows cash payments from April* 30*th,* 1869, *to some time after September* 24*th,* 1869, *the last item that is dated, being dated September* 24*th,* 1869, *and there being three small cash items immediately following the item of September* 24*th.*]

Q. 49. Were those cash payments that are set down in George W. Drawbaugh's account in said book, paid to him for work done by him on Stanton's mill?

A. Yes, sir.

Q. 50. You have related the circumstances attending your first talking through the machine in 1872 or 1873. Where were the machines that you talked into and he listened at, at that time?

A. They were down in the shop where Daniel worked. The machine that I talked in was in a small room in the north-eastern corner of the shop, in the second story of the shop; and the machine that he listened at was in the south-eastern part of the shop, on the same floor.

Recess for dinner, until 2, P. M.

Examination resumed, pursuant to adjournment, at 2.45 P. M.

Present, same counsel.

Examination of J. B. Drawbaugh by Mr. Hill suspended in order to take the deposition of John F. Lee.

Examination of J. B. Drawbaugh continued by Mr. Hill:

Q. 51. When did you next talk through the machines, or hear anybody talk through them?

A. Some time after that, may be a month or more, I talked through it from the cellar of the shop; it was on the eastern part of the shop, in the cellar.

Q. 52. Who listened then, and where was he?

A. Daniel Drawbaugh; he was up on the second story of the shop, in the south-eastern room.

Q. 53. State all you remember about that conversation, and the circumstances connected with it.

A. Part of the conversation that I held through the talking-machine was, that Frogtown was the capital of Lower Allen township, and that A. B. Shank was governor. I also described some of the cities of the United States. Among them was Harrisburg, the capital of Pennsylvania, and other conversation that I don't recollect now.

Q. 54. Did you know whether Daniel heard what you said through the instrument?

A. Oh, yes; he told me that he understood all that I said, and also told me part that I did say.

Q. 55. While you were working there for the Haucks, was Daniel doing anything with his talking-machine—working at it, or using it?

A. I noticed him working at it at different times.

Q. 56. From July, 1874, when you quit Haucks, to March 16, 1875, when you went to work for the Axle Company, you say you were at your brother's shop frequently. What was he doing with the talking-machine, if anything, during that time?

A. I noticed that he was working at it during different times that I was there, that some of them were standing on the work-bench, and that some of them were taken apart, and the parts taken out were also lying on the work-bench. I noticed also that one of them was fastened to a cupboard that was there, connected with a wire that ran to the cellar.

Q. 57. While you were working there in March and April, 1875, what was Daniel doing, if anything, about his talking-machines?

A. There was one or two occasions that I recollect that I talked through them from the cellar.

Q. 58. From April, 1875, down to 1879, when you put up the shafting for Chellis, did you do any work in Daniel's shop, so far as you recollect, or not?

A. I don't recollect that I did.

Q. 59. When you put up the shafting for Chellis, what was Daniel attending to?

A. He was not there much. He was attending a trial, or law-suit, that Mr. Chellis had with the Haucks about the faucet invention.

Q. 60. While you were putting up that shafting for Chellis, did you see any talking-machines around in the shop, or not?

A. I did.

Q. 61. Did you see Daniel doing any work on talking-machines while the electric clock company were occupying the shop?

A. I did.

Q. 62. While you were there working for the Haucks, in 1873 and 1874, how often did Daniel get you to talk for him on the machines?

A. Not very often.

Q. 63. Give us an idea of how often.

A. I could not hardly give you an idea. It might have been half a dozen times He was not in the habit of asking me to talk through the machine, as he did some others that frequently visited there.

Q. 64. Did you, along in those years, from 1872 to 1879, or any part of them, get the idea that your brother Daniel was desirous of concealing his talking-machine work from you? If so, what caused you to have that opinion or suspicion?

A. When I first discovered that he was working on his talking-machine, as it was then called, I accused Daniel quite severely of wasting his time on foolish inventions. I told him that they would amount to nothing, and that he had a large family, and that he should turn his attention to something that would support his family better than by working at these foolish things, and that it would amount to nothing in the end, and that he was an extraordinary good mechanic, and that the people knew him to be that; that he could get employment readily, and could make a good living for his family. I had an opinion that he did not want to show them to me. At different times, when I came into the shop, he would set them behind something, or else cover them over, and then try to direct my attention to something else in a different part of the shop. Several times that he had done so, I went and uncovered the machine, to see what he was doing. I found some one of these machines.

Q. 65. From 1872 or 1873, when he first showed you the machine, down to 1879, when you put up the shafting for Chellis, what was the fact about Daniel's working with or on these talking-machines? Was he at them pretty much all the time, or were there times when he was not doing anything at them, so far as you know?

A. He was, as far as I know.

Q. 66. Your brother Henry testified that you requested him not to encourage Dan in his work on the talking-machines, or to discourage him, or something to that effect. Do you remember about that?

A. I do.

Q. 67. What was Dan's financial circumstances, so far as you know, from 1869 down to the beginning of 1880?

A. He was very poor.

Q. 68. Do you know what he did with the money which he received from the old faucet company, composed of Gorgas and others?

A. He paid a great deal of that money for debts that he had contracted before that time.

Q 69. From 1869 down to the beginning of 1880, did your brother devote the greater part of his time to any one invention? If so, what one?

A. All that I seen or noticed was entirely given to the so-called talking-machine.

Q. 70. He made some experiments with the electric clocks and faucets, did he not?

A. He did, but I never knew so much about that. I don't know that he ever called my attention to that machinery—the clock. He did on several occasions to the faucet.

EPHONE COMPANY,-1

Q 71. Did Dan ever talk to you much about his financial condition, or not?

A. He did not. On several occasions I asked him for a little money, and he always told me promptly that he had none.

Q. 72. When did your wife die?

A. She died on the 26th day of January, 1875.

Q. 73. For a good many years prior to her decease, there had been some misunderstanding or coldness between your family and that of your brother, had there not?

A. Yes, sir; Daniel's wife and my wife were not on speaking terms until a few weeks before she died.

Q. 74. Please look at the machine "A," now shown you, and state whether you ever saw it before, and if so, whether you can fix the time when you first saw it.

A. I saw the machine before, but I can't fix the time when I first saw it.

Q. 75. Answer the same question as to the machine "D" and "E."

A. I have saw the machines about the shop, but I could not fix any time when I saw them.

Q. 76. Answer the same question as to the machines "G," "K," "L," "M," "N," "O."

A. I have saw them,—I think all of them,—but I could not fix any time when. Neither could I say which of them I saw first or last.

Q. 77. Answer the same question as to the machine "H."

A. I saw the machine, but couldn't give any date when I first saw it.

Q. 78. The same question as to the machine "J."

A. I don't recollect that I saw that machine at all. It may have been one of the machines that I saw fastened to the cupboard, but I did not take any particular notice of it.

Q. 79. Do you recollect the fact of Christian Eberiy breaking a wheel on his buggy or carriage, while riding to or from Carlisle, a good many years ago?

A. I do.

Q. 80. What, in particular, makes you remember it?

A. I was along with him. I was in the buggy at the time.

Q. 81. Can you fix the time when that circumstance occurred?

A. I can, within a mouth or two.

Q. 82. State when it was, and how you fix the date within a month or two.

A. I was working at that time for Mr. Eberly. I was repairing a water-wheel in the grist-mill, and that was some time between the 10th and 27th day of September, 1864. I fix that time from work that I had done before for Mr. Eberly at a brick-yard in Dauphin county. When I returned home from there, I commenced at the grist-mill. I worked at the brick-yard from the 20th day of August to the 31st day of August, 1864. I fix these dates from entries in my book, made at the time the work was done, which book I have here present.

Q. 83. Please point out to the examiner, in order that he may copy them upon the record, the items in the book referring to the work on the mill.

A. Here they are.

[*Examiner copies them as follows:*

[*The date at head of page is* 1864.]

Sept.	5th,	To one day work in mill	2 00
"	10	To 5 days work	10.00
"	15	To 2 day "	4.00
"	17	To 2 day work	4.00
"	27	To 3 days work	6.00

The last three items before the item dated Sept. 5th are for work on the brick-yard.]

Q. 84. Do you, or not, recollect that after you did the work on the brick-yard you meant to work next on the grist-mill?

A. Yes, sir; I did

Q. 85. Was there a carriage-maker at Eberly's Mills, at the time Mr. Eberly broke his carriage wheel, as you have stated? If so, what was his name?

A. Yes, sir, there was; his name was William Lory.

Cross-examined by Mr. Storrow:

Cross-Q. 86. How long have you lived at Eberly's Mills?

A. I lived at Eberly's Mills since 1833.

Cross-Q. 87. Have you made an affidavit about your brother's talking-machines?

A. No, sir; I did not, that I recollect of.

Cross-Q. 88. When did you first see any clocks at your brother's shop?

LEPHONE COMPANY,-1

A. I can't give anything definite, but I think I saw a clock there from 1871 to 1873, along there.

Cross-Q. 89. Was it run by electricity?

A I am not able to say. The first clock I saw there was a clock with a round face, and was regulated by another clock, but whether by electricity or magnetism, I am not able to say. I don't know how he had it arranged at all. I never examined it.

Cross-Q. 90. Did he make either of those clocks himself, or did he buy both of them?

A. One, as far as I know, he made. The other was a large eight day clock that he had purchased somewhere at a public sale.

Cross-Q. 91. You say that he used part of the money that he got from Gorgas and others for his faucet to pay debts with. I suppose you refer to the money which they paid him to buy his invention when they started the business, do you?

A. Yes, sir.

Cross-Q. 92. What debts did he pay with it, or what kind of debts?

A. Debts that he had contracted for the living of his family, such as meat, flour, and store bills.

Cross-Q. 93. Had not he been able to earn money enough to pay for necessaries for his family as he went along?

A Yes, he would have been able, and more than able, if he had not expended his time on his experiments and inventions.

Cross-Q. 94. What experiments and inventions had he been expending his time on then?

A. The telephone, or speaking-machine, so called here.

Cross-Q. 95. Had he been spending his time on the speaking-machine before he sold his faucet to Gorgas and others?

A. No, not that I know. I didn't know anything about him working on it then at all.

Cross Q. 96. Why was it he had run up debts for groceries and provisions before he sold his faucet to Gorgas?

A. He was then experimenting on faucets and some other inventions that he had.

Cross-Q. 97. Do you mean he had been spending his time on those experiments instead of on regular work that would bring him in regular pay?

A. The most of his time.

Cross Q. 98. How large a family did he have in 1869?

A. I can't exactly tell—some five or six children.

Cross-Q. 99. From the time you stopped working for the Axle Company, in 1875, down to the time the Clock Company began work at Dan's shop, what were you doing?

A. Working in the country, at mill-wrighting, &c.

Cross-Q. 100. Were you in his shop during that time?

A. I was at different times, on a visit

Cross-Q. 101. How large a job was the work you did for Stanton—how much money?

A. I had undertaken the job to finish the mill, excepting some of the work, for twenty-seven hundred dollars, and the extra work done to it, above the contract, amounted to something near thirty-three hundred dollars.

Cross-Q. 102. In your twenty-eighth answer, you undertook to describe what took place the first time when you heard talking through your brother's machine. When was that?

A. That was at the time that I said—a little while before the Haucks commenced work there, but I can't say what took place at the time, any more than I said to him, "Dan, if this is as good and as profitable a machine as you represent it to be, why don't you get it patented?"

Cross-Q. 103. Was that the first time that he and you had ever talked about the machine?

A. We had some conversation about it before that.

Cross-Q. 104. What was that conversation?

A. I couldn't say any more than that I hooted at the idea.

Cross-Q. 105. Was this the first time that he had ever shown you a talking-machine?

A. The first time that he ever showed it to me that I recollect.

Cross-Q. 106. In your sixty-second answer, you say, when you first discovered that he was working on it, you accused him quite severely of wasting his time, and so forth. When was that conversation?

A. I could not exactly say. I knew that he was experimenting on something of the kind in 1869.

Cross-Q. 107. Do you think that conversation that you gave in your sixty-second answer was in 1869? Is that your memory?

A. It was about then, or some time after. I could not point out any time positively, but it was before I talked through the machine.

Cross-Q. 108. Did you name that machine to him in that conversation?

A. I don't know that I did; I don't recollect.

Cross-Q. 109. In that answer, you say that you blamed him for working at these foolish things that would amount to nothing in the end. What things did you name to him at that time?

A. I meant his general inventions, that he had before and at that time.

Cross-Q. 110. Did you ever blame him specially about the talking-machine?

A. I did.

Cross-Q. 111. When?

A. Some time since 1869. I did it, not only once, but at different times. I recollect that at one conversation I told him that it was one of his idols, and that it was full time for him to quit worshipping idols.

Cross-Q. 112. When was that?

A. That was some time on or before 1873—before I talked through the machine.

Cross-Q. 113. You testified that you remember asking your brother Henry to discourage Dan. When was that?

A. It was some time after 1869. I could not tell when. It was while I worked at the mill. I saw him frequently, and we had different conversations about these things.

Cross-Q. 114. Do you mean while you worked for the Haucks?

A. To make me understood properly, I would have said that, in 1869, while I worked at the mill, we had frequent conversations, and I might have said that he should discourage him in working at machinery. I don't say positively that I did, but it might have been at that time, or some time after that.

Adjourned until July 12th, at 10 o'clock, A. M.

July 12, 10.20, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Cross-examination of J. B. Drawbaugh continued:

Cross-Q. 115. Did you work for the Drawbaugh Manufacturing Company in 1869?

A. I did, in the early part of the winter of 1869.

Cross-Q. 116. How long did you continue to work for them ?

A. At that time, I worked for them to within a few weeks of the date that I went to work on Stanton's mill.

Cross-Q. 117. You mean, I suppose, that you worked for them during the winter, before you built the Stanton mill ?

A. Yes, sir.

Cross-Q. 118. You worked for them again after you finished the Stanton mill, didn't you ?

A. Yes, sir.

Cross-Q. 119. How long did you work for them the second time ?

A. I am not able to give exact time. I worked for them in the winter of 1869–'70, on until in the spring. I kept no account of my time then ; it was kept by the Company.

Cross-Q. 120. You got through with your work at Stanton's mill some time early in October, 1869, didn't you ? Please look at your account.

A. Yes, sir ; I see that the last work that I done there—job work—was 9th of October. I did other work afterwards that was not job work, and is not in the book. Three days' work at mill is also charged on the 7th of January, 1870.

Cross-Q. 121. The Drawbaugh Manufacturing Company was the company composed of Gorgas and others, who made your brother's patent faucets, was it not ?

A. Yes, sir.

Cross-Q. 122. It was the same concern that was sometimes known as the Pump Company, was it not ?

A. I guess that will want a little explanation, to show the difference. In the commencement, the Pump Company and the Faucet Company were two different Companies. After the invention of the faucet was completed, Daniel discovered that he was not able, for the want of funds, to bring the faucet into market. He sold the right of the faucet to a company by the name of Gardner & Croll, for the sum of one thousand dollars, for which he took Mr. Gardner's paper, with Jacob Coover's name, for security. Then, Daniel turned the faucet into a pump, or, rather, made a pump on the same principle as the faucet. On that they formed a company in the names of Mr. Gorgas, Musser, Hursh, and others. They were to pay him a consideration of six thousand dollars, as I have heard. That company established a machine-shop at Eberly's

Mills, which some of the company told me cost them from twenty thousand to twenty-five thousand dollars. After manufacturing the pump for about one year, they found the pump to be a failure. The Pump Company then purchased the Drawbaugh rotary molasses faucet from Mr. Gardner and others. The price they paid for it I don't know.

Cross-Q. 123. Did Mr. Gardner have anything to do with the mill—I mean, did he work there, or come there?

A. Not that I know. He did some little work there, outside.

Cross-Q. 124. What do you mean by doing a little work outside?

A. He filled up a place on the edge of the mill-pond, to erect a temporary blacksmith-shop.

Cross-Q. 125. Was that close by the mill,—a few feet from it?

A. It was probably thirty feet from the mill, or shop.

Cross-Q. 126. Where did he live then?

A. At Eberly's Mills.

Cross-Q. 127. Does he live there now?

A. No, sir; he does not. He has not lived there for the last six years.

Cross-Q. 128. Did Mr. Gorgas have anything to do with the manufacturing, or did he come over to the shop where manufacturing was going on?

A. Yes, sir; he had and he was there very frequently—as much as two or three times a week.

Cross-Q. 129. There were two Mr. Gorgases, father and son, were there not, in the Company?

A. Yes, sir.

Cross-Q. 130. Which of them was it who was over there frequently, or were both?

A. Young Mr. Gorgas directed the work in the shop, and was there almost all the time, managing the affairs of the shop, and the old gentleman was there often.

Cross-Q. 131. Did your brother Dan have anything to do with the manufacturing for that Company?

A. I don't know anything more than that I had learned at the time that he was one of the stockholders.

Cross-Q. 132. Did he work for them?

A. I don't know that he had done any work for them.

Cross-Q. 133. You think he had nothing to do with their manufacturing, except as a stockholder?

[*Objected to as incompetent.*]

A. Not that I know.

Cross-Q. 134. In your eighty-eighth and eighty-ninth answers, you speak of two clocks, which you saw at your brother's shop, from 1871 to 1873. Did you afterwards see any more clocks there, between 1873 and the time when the Clock Company began operations, in the spring of 1878?

A. I did.

Cross-Q. 135. How many?

A. I recollect of seeing two there; one is there yet.

Cross-Q. 136. Did your brother make them?

A. My son made one of the cases, and the works I would only suppose my brother made. I did not see him making them.

Cross-Q. 137. Which son?

A. George W. Drawbaugh.

Cross-Q. 138. There was an electric clock at one time at Mr. Shapley's, Mechanicsburg. Did your brother make that, or did Mr. Shapley make that?

A. I saw the clock at Mr. Shapley's, but I don't know whether my brother or Mr. Shapley made it.

Cross-Q. 139. In your fifty-sixth answer, you say you noticed, between July, 1874, and March, 1875, what you supposed was a talking-machine fastened to a cupboard in the shop. Whereabouts in the shop was that?

A. In a small room in the north-eastern corner of the shop.

Cross-Q. 140. Was it fastened to the cupboard door, or to the standing part of the cupboard?

A. The cupboard door.

Cross-Q. 141. Inside or outside of the door?

A. The inside of the door. When the door was closed, it was inside of the cupboard.

Cross-Q. 142. How did you come to see it then?

A. The door stood open very often.

Cross-Q. 143. How big a thing was it, and what kind of shape?

A. I don't know that I can exactly recollect. It might have been four or five inches, and was square, probably two or three inches deep. I could not tell; I didn't look at it particularly.

Cross-Q 144. Was it made of light wood or dark wood?

A. I think it was dark wood.

Cross-Q. 145. Did you ever see your brother working on his talking-machines between 1876 and 1879?

A. I did.

Cross-Q. 146. How often?

A. I could not say how often.

Cross-Q. 147. Was it occasionally, or was it very often?

A. It was very often. I don't recollect of seeing him working at anything else.

Cross-Q. 148. In your thirty-first answer, in describing the talk which you say you and he had through the machines, you say that he came around and took the top off the machine you had been talking into, and did something to it. What was it he did?

A. I didn't take any notice, and don't know.

Cross-Q. 149. What did he do it for?

A. To make the hearing of it more distinct.

Cross-Q 150. Has your brother Dan ever lived with you during the last ten years?

A. He did. He boarded with me a few weeks.

Cross-Q. 151. When?

A. I don't know that I can give you any dates, further than that it was the last summer that he lived at Mechanicsburg.

Cross-Q. 152. How many summers did he live at Mechanicsburg?

A. I don't positively recollect, but it appears to me that it was two.

Cross-Q. 153. He lived with you in the summer of 1876, didn't he?

A. I can't positively say. I had him charged with some boarding, but it is not in these books that I have here, and I don't remember.

Cross-Q. 154. Did you go with him to the Centennial, or did he go alone?

A. I wasn't with him.

Cross-Q. 155. Did you ever hear of any telephones invented or made by anybody except your brother?

A. I don't remember that I did, before the talk was about this suit. I might have read some of the circumstances in the papers, but I don't remember.

Cross-Q. 156. Did you ever talk about anybody else's telephones with your brother Dan or your brother Henry before 1880?

A. I don't remember that I ever had any talk with my brother Henry about telephones at all. I did not have any such talk with my brother Dan about anybody else's telephone before 1880, that I recollect.

Cross-Q. 157. In your fortieth answer, I understand you to say that you knew of talking done through your brother's machine in 1869. Is that what you mean by it?

A. I would say here that I only knew of the talking being done by others talking about it, saying that it had been done. I did not see it done.

Cross-Q. 158. You gave a deposition for your brother in the faucet case, didn't you?

A. Yes, I was a witness in the case.

Cross-Q. 159. I call your attention to your twelfth answer, on the one hundred and eighteenth page of the printed record of that case, which answer is as follows: "During the time of the Drawbaugh Manufacturing Company, he was appointed master mechanic of that company, and I never knew what wages he got." I suppose the statement contained in that answer is true, is it not?

A. I would say it was, as far as I was acquainted with it. I only knew of his appointment from what others said. I never saw the records, and I remember of his attention being called to particular work.

Re-direct by Mr. Hill:

Q. *Q.* 160. You have referred to your brother Daniel's being poor and in debt at the time when he sold his faucet and pump to Gardner, Gorgas, and others. Do you know anything about his meeting with heavy losses for a poor man, and becoming involved in debt in consequence of it, by a transaction which occurred about the beginning of the Rebellion, in the latter part of 1860 or early part of 1861?

A. I do.

Q. *Q.* 161. Do you remember what amount of money Dan lost in that transaction?

A. I heard him say about that time that his expenses and labor on manufacturing those machines was about twenty-five hundred dollars.

Q. *Q.* 162. That loss was occasioned by the sale of machines and patent rights in the South just before the Rebellion, the proceeds of which could not be collected by reason of the war, was it not?

A. Yes, sir.

PHONE COMPANY,-1

Q. Q. 163. Do you know whether, at the time when he sold his faucet and pump to Gorgas and others, he was still embarrassed by debts growing out of that old transaction?

A. He was.

Q. Q. 164. You say, in your cross-examination, that when you had the talk through the talking-machine, Dan came in and took the top off of the machine and did something to it, and that it was to make the hearing more distinct. How do you know it was to make the hearing more distinct?

A. I know from the fact that I could not understand what he said. I told him so, and then he tried to adjust it so that I could understand it.

Q Q. 165. You hadn't explained to us before that he talked through the machine to you, but I understood you to say that you did not see the machine at which the talking was heard, but only the one into which you talked. Please explain more fully about that.

A. In the course of the cross-examination, I don't think I understood the question exactly. I thought it referred to a different time.

Q. Q. 166. Did you see him take the top off the machine and do something to it more than once?

A. I don't recollect now that I did, more than once.

Q. Q. 167. Was that once at the time when you first talked through the machine?

A. Yes, sir.

Q. Q 168. That was at the time when you say you didn't go 'round into the room where he was listening. How did you hear him talk through the machine? Did he talk back to you from that room, so that you heard through the same machine that you talked into, or how was it?

A. I don't know. I am a little confused now. If I said that he talked back to me through the same machine, I am not correct. It was at another time that I went in and listened at the same machine that he had been listening at.

Q. Q. 169. I mean, at the time when he took off the top and did something to the machine, which you say was the first time you talked through it. I understand you to say that he took off the top, and did something to the machine, at that time, because you could not hear distinctly. If so, you must have been listening at the machine, and yet I understand you to say you did not listen at the machine at that time. What I want to get at is the fact.

A. I now say that my answer wasn't fully comprehended. When I first talked through the machine, Daniel came around and took the top off of the machine and done something to it; and at another time that I was listening in the same room that Daniel was listening at the first time he talked to me, and I could not understand what he said, and he then came and done something to the machine, or adjusted it, so that I should understand.

Q. Q. 170. Did you then understand, after he adjusted it?

A. Some words, but not all.

Q. Q. 171. Your hearing is slightly defective, is it not?

A. Yes, sir.

Q. Q. 172. Now, at that first conversation, when Dan came around and took the top off of the machine and adjusted it, and then went back again and listened, do you know why he took off the top and adjusted the machine?

A. When he came around, he did say something about it not being quite right, but I don't remember what it was.

Q. Q. 173. How long was the one conversation that you have just mentioned after the other?

A. I couldn't say. I recollect of asking him to talk through the machine, to see whether I could understand it.

Re-cross by Mr. Storrow:

Re-cross-Q. 174. Did you listen at any of your brother's machines while you worked for the Haucks, in 1873 and '4?

A. I think I did.

Re-cross-Q. 175. Had you ever listened with any of them before you worked for the Haucks?

A. I don't remember that I did.

Re-cross-Q. 176. What were the machines and patent rights which your brother sold down South and didn't get the money for?

A. It was a patent stave-heading and shingle-cutter.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 12th day of July, 1881.
FRED. M. OTT,
Examiner.

J. B. DRAWBAUGH.

Adjourned for dinner until 2.15, P. M.

Examination resumed at 2, P. M., pursuant to adjournment.

Present, same counsel.

GEORGE W. DRAWBAUGH, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is thirty-eight; residence, Eberly's Mills, Cumberland county, Pa.; occupation, machinist. I am the son of John B Drawbaugh, and a nephew of Daniel Drawbaugh.

Q. 1. Do you recollect whether you did any work in the shop for the old Drawbaugh Manufacturing Company while they occupied it?

A. No, sir; I did not.

Q. 2. Did you assist your father in doing some work on Stanton's mill, about twelve miles from Carlisle, on the Condoguinit creek?

A. Yes, sir; I did.

Q. 3. What business did you go into soon after the work was done on that mill?

A. Wagon-making.

Q. 4. Where?

A. At Eberly's Mills.

Q. 5. Did you hire a shop and run it yourself?

A. Yes, sir.

Q. 6. How long were you in the business of wagon-making?

A. Near about two years.

Q. 7. About what years were they, as near as you can fix it?

A. The years 1870 and 1871.

Q. 8. While so engaged in carriage-making, did you do any work for Jacob M. Sadler?

A. Yes, sir; I did.

Q. 9. What was that work?

A. It was building a new wagon box, and repairing the running part.

Q. 10. Of whom did you purchase the lumber you used in that job?

A. John F. Lee, of New Cumberland.

Q. 11. How soon did you do the work for Sadler after purchasing the lumber?

A. I began immediately after I purchased the lumber.

Q. 12. Did your uncle, Daniel Drawbaugh, assist you in that job? If so, how?

A. He assisted me in painting the wagon.

Q. 13 State when you first had any personal knowledge of his talking-machine, and state all the circumstances.

A. The first knowledge that I had of the talking-machine was during the time we were painting that wagon. He asked me to talk to him through the machine, and I talked into it to accommodate him more than because I cared about it. While we were talking, he halloed over to me and said: "George, do you hear me?" My answer was that I did. He said then that I should listen a little, he wanted to whisper through the machine. Then he asked me whether I could hear the whispering. I told him that I could hear him rather plainer than I could while he spoke louder. He then asked me to talk and he would listen. I talked into it for him and then asked him whether he could hear me. He allowed that he could, but he couldn't understand what I said. Then he said: "What in the devil is the reason I can't hear as well as you can?" I answered him, saying I didn't know why he couldn't. There was some more connected with that time, but I—when I went to mix my paint I couldn't just get a hold of the can. I found one in the room on the table. He says: "George, where did you get that can?" I answered him: "In the room on the table." He said: "Dang it, I wanted that can for experimenting." He said then that we could clean it after I got through with it, and that it would then answer the same purpose.

Q. 14. Did he ask you to try the talking-machine more than once while you were painting that wagon?

A. Yes, sir, he did; quite often.

Q. 15. And did you do it?

A. Yes, sir.

Q. 16. Do you recollect anything that he said to you through the machine during those times?

A. Yes, sir; I remember of him mentioning my name, "George," and some of the principal cities.

Q. 17. Did you do anything for the Haucks while they were doing business at the shop at Eberly's Mills?

A. Yes, sir; I did.

Q. 18. When did you begin to work for them, and when did you finish?

A. I would have to refer to my book, before I could tell that ex-

EPHONE COMPANY,-1

actly. I have my book with me, and from it I find that I began work March 9th, 1874, and closed on the 20th of June, 1874.

Q. 19. Do you remember how long it was after you closed, on the 20th of June, 1874, that the Haucks closed their work at that shop?

A. I can't say that I do. But I don't think that they done any work after that.

Q. 20. Your father worked there till July 2d, 1874. Do you think they were about closing up at that time?

A. I think that is about the time. I was laying around there, waiting for more work, and I never got it afterwards from them. That is what makes me think it was at that time that they closed.

Q. 21. From the year 1867 down to March, 1874, were you in your uncle Daniel's shop much, or not?

A. It was very seldom that I got there.

Q. 22. Did you do any work for the Axle Company while they were carrying on their operations in that shop?

A. Yes, sir; I worked a little for them.

Q. 23. Do your books show when you worked for them?

A. Just in part when I worked.

Q. 24. What time do your books show?

A. "January 22d, 1875, seven hours;" "January 28th, three hours." That is all the time that I have.

Q. 25. Did you do any work for them that is not shown on your books?

A. Yes, sir.

Q. 26. About how much, and when?

A. As near as I can come at it, it was about two weeks. I can't give the exact date. It was in the year 1875, but I don't know the month, or day of the month.

Q. 27. Did you do any work for your brother, Harman K. Drawbaugh, there at that shop, during that year, 1875?

A. Yes, sir; I did.

Q. 28. State whether he was, or was not, doing some work at that time under a contract with the Axle Company.

A. He was working under a contract, but what it was I don't know—how he had the contract.

Q. 29. Did you do any work for your uncle Daniel at that shop in 1877?

A. Yes, sir.

Q. 30. When did you begin and when did you finish that work that you did for him?

A. I must refer to my book again. I began April 30th, 1877, and worked until the 22d of June, 1877.

Q. 31. What were you doing for him at that time?

A. I built him a set of Pelton horse-power patterns; also several clock cases. That is about all I can remember just now of the work I done.

Q. 32. Did you do any work for the Electric Clock Company, while they occupied that shop, during the time from the spring of 1878 to the spring of 1879?

A. Yes, sir; I did.

Q. 33. State whether much or little.

A. I was working pretty regularly for them.

Q. 34. In the year 1876, were you about your uncle Daniel's shop much, or not?

A. Very seldom. My work called me away from the place.

Q. 35. Please look at the instrument "P," now shown you, and state when and where you first saw it.

A. I first saw that machine in 1878, at Dan Drawbaugh's shop.

Q. 36. How came you to see it there then?

A. The wood-work of that machine I made myself at that time.

Q. 37. Was that, or was it not, while the Clock Company's work was going on at that shop?

A. It was while I was working for the Clock Company.

Q. 38. Under whose directions did you make it.

A. Under the direction of Dan?

Q. 39. State the circumstances about the making it—what patterns you had to work from, and what directions were given you by Dan about making it.

A. He had an old machine made of rough poplar boards, something similar to this machine. The changes on it he told me by word of mouth—how to change it. The shape of the base-board was marked out by a pencil.

Q. 40. Please look at the machine "J," now shown you, and state when you first saw that, and how you came to see it.

A. This box I saw in the year 1878. I made that box myself—the wood-work of it.

Q. 41. Who made the metal work?

A. Dan made the metal work. There was no one working on it but him. There was no one working in the shop at that time but him and me.

Q. 42. Was the metal work which was to go into the box made before or after the box, so far as you remember?

A. It was made before, as he measured the metal work to get the right depth of the box, so that it would go in without any trouble.

Q. 43. Do you remember when you first saw this machine "H"?

A. I remember of seeing it before this box ["J"] was made. He gave me this box ["H"] as a sort of a pattern to go by in making "J." He gave it to me more for style than anything else, and I changed the style a little. He stated at the time that he wanted it somewhat deeper and square, instead of smaller at one end than the other.

Q. 44. Were the metal works in the box "H," when he brought it to you for a pattern?

A. Yes, sir.

Q. 45. Did the box then look as though it had been made some time, or did it look new?

A. It looked as though it was made some time before that.

Q. 46. Please look at machine "C reproduced," and state when you first saw a machine like that, to the best of your recollection.

A. This machine, or a machine like it, I saw in 1874.

Q. 47. Did you ever use it, or witness its use, at that time?

A. Yes, sir; I used it, and witnessed its use by others.

Q. 48. Please look at the two machines "F and "B," and state when you first saw machines like those, so far as you recollect.

A. Those machines, or machines like them, I saw first in the year 1870, while painting the wagon box that I have spoken of before.

Q. 49-50. Do you recollect whether the tin box on machine "B" was closed at either end at that time?

A. It was closed at one end—this end next to the magnet; that I recollect of.

Q. 51. Do you recollect what it was closed with?

A. I was under the impression that it was bladder. He was gathering up all the bladders around the country at the time, from all the butchers. I know it was bladder, for I remember of asking him, and he told me that was what it was.

Q. 52. Do you recollect of anything being attached to that bladder?

A. I think there was—either a thread or a piece of wire. I didn't pay much attention to it.

Q. 53. I do not mean at the edges of the bladder, but across the middle of it, in front of the magnet. Do you remember whether there was anything attached to it there or not?

A. I can't say that I do. I didn't pay enough attention to it to examine it closely.

Q. 54. Please look at the various machines now shown you, marked "A," "D," "E," "G," "K," "L," "M," "N," "O," and "Q," and state whether you ever saw these machines, or any of them, or machines closely resembling these, in your uncle Daniel's shop, at Eberly's Mills.

A. Here are machines, marked "D" and "E," that I have seen in the shop. These two I saw lying on the window, in Dan's work-shop. Here is a machine I saw frequently, marked "A." There have been some changes made—the mouth-piece came out here in the center of the machine. Other ways it has the appearance of the machine that I saw. I am satisfied that I saw the balance of the machines, but I can't identify the shapes so well as these other ones.

Q. 55. State whether you did or did not, from the time when you worked for the Haucks down to the time when you worked for the Clock Company, see a good many different talking-machines in and about your uncle Daniel's shop. What is the fact about that?

A. I really can't say whether I did or did not. In the year 1877, I know I seen different machines. From 1874 to that date, I wasn't much in the shop—not a great deal, only what short time I worked for the Axle Company.

Q. 56. When you worked for your uncle Daniel in 1877, making the horse-power patterns and the clock cases, what was he principally giving his own attention to?

A. The most of the time he was working on what he termed his talking-machine.

Q. 57. Didn't he help you any about your work?

A. Nothing more than to show me how he wanted it done. It appeared a good bit of trouble to him to do that, as he was anxious to go ahead with his talking-machine.

Q. 58. When you were working for the Electric Clock Company there, was Dan giving a good deal of attention to his talking-machine or not?

A. The majority of his time he spent on the talking-machine he was supposed to have been working for the Clock Company.

Q. 59. What was he doing at night during that year?

A. Some nights he would be working on the clocks to make up for lost time in day time, and other nights he was working on his talking-machine, seldom leaving the shop before eleven or twelve o'clock.

Q. 60. Do you remember what he was doing when you worked there for the Axle Company a short time in 1875?

A. I can't say that I do, more than my brother used to remark that "Dan's on that machine of his and had better be doing something else."

Q. 61. Do you know what Dan's financial circumstances were during the ten years prior to 1880?

A. He generally appeared a little hard up, I know that.

Q. 62. What reason did you have to know that?

A. My reasons are that he frequently borrowed money of me, as much as two and three dollars at a time, and I have work charged against him in my book that never was paid, that I worked for him in 1877.

Cross-examined by Mr. Storrow:

Cross-Q. 63. When did you make the wood-work of "J"?

A. In 1878, while working for the Clock Company.

Cross-Q. 64. What month?

A. I really could not say.

Cross-Q. 65. What part of the year?

A. I couldn't come at it exactly, but it was somewheres between spring and fall, that I know of.

Cross-Q. 66. Are you perfectly sure of that?

A. Yes, sir.

Cross-Q. 67. What work did you do for Harman Drawbaugh at the shop?

A. I turned up a few buggy axles and worked at different other parts of the axles.

Cross-Q. 68. When did you quit working for the Clock Company?

A. I will have to refer to my book. My memory is a little short to-day. I haven't got the Clock Company's time here at all. I know it was in the year 1878. I really can't say when it was. I haven't the date with me, and I ain't sure that I have it at home.

Cross-Q. 69. Can't you tell from your memory?

A. No, sir; I really can't.

Cross-Q. 70. What did your uncle want the horse-power patterns for?

A. They were made for a man by the name of Liggett, living at that time in the town of Ickesburg, Perry Co.

Cross-Q. 71. What did you have to go by in making them?

A. I had a draft of them, on a large drafting-board.

Cross-Q. 72. Who made the draft?

A. Dan Drawbaugh made the draft.

Cross-Q. 73. What did he have to make it from?

A. That is more than I am able to say.

Cross-Q. 74. Did he send the patterns away as soon as he had got them done, or did he use them?

A. Part of the patterns were sent away before they were all done.

Cross-Q. 75. Where did you have your wagon maker's-shop?

A. My wagon-maker's shop was at the west end of the town called Eberly's Mills.

Cross-Q. 76. How far from your uncle Daniel's shop?

A. I would suppose it to be in the neighborhood of four hundred yards.

Cross-Q. 77. Did you rebuild that wagon you have spoken of at your own shop?

A. Yes, sir.

Cross-Q. 78. Did you paint it at your own shop?

A. No, sir; it was painted at my uncle Daniel's shop.

Cross-Q. 79. What did you take it down there for to paint?

A. For the simple reason that I was no expert on lettering, and he was pretty good at it, and said he would mark off the letters if I would bring it down, and also help to paint them.

Cross-Q. 80. What work was going on at his shop at that time?

A. I don't think there was anything of any account at all—not while I was there.

Cross-Q. 81. Have you lived at Eberly's Mills all your life?

A. Yes, sir; I count that my home.

Cross-Q. 81½. What work did you do for the Clock Company?

A. Nothing more than built the cases of wood.

Cross-Q. 82. How many cases did you build for them?

A. As near as I can mind, it was four or five; they were large ones.

Cross-Q. 83. How many had you built for your uncle Dan before that?

A. Two, that I can remember of.

Cross-Q. 84. Didn't you build a third?

A. I changed one that he had built himself.

Cross-Q. 85. Please describe all the talking-machines that you ever saw at your uncle Daniel's shop.

A. All the description I can give of them is from the machine itself—what I see of it.

Cross-Q. 86. You mean what you see now on the table, or have seen recently?

A. I have seen all the machines that are here on the table, and a great many other ones that are not here.

Cross-Q. 87. Describe those that are not here.

A. I can't give more of a description of them than that they are over there at the shop now; they are hanging there; I can't describe them.

Cross-Q. 88. Do you refer, in your last answer, to instruments which have been made this year, for the purpose of being exact copies of the instruments now on the table?

A. I think that is what they are for.

Cross Q. 89. Did you ever see any talking-machines at your uncle's shop, except these now on the table, and the recent copies of them which you have just spoken of?

A. I can't say whether I did or did not.

Cross-Q. 90. Why can't you say?

A. That is a little hard to answer—why, I can't say.

Cross-Q. 91. Don't you remember whether you ever saw any others?

A. I do not. Some of these machines have been changed so often that one might think they were different machines.

Cross-Q. 92. In your thirteenth answer, you have given a long description of an occasion when you say he and you talked through some of his machines. What machines did you use on that occasion?

A. Here, these are the machines, [indicating "F" and "B,"] or these look like the machine—that tin box and that tumbler.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 12th day of July, 1881.

FRED. M. OTT,
Examiner.

GEO. W. DRAWBAUGH.

JOHN F. LEE, *being produced, sworn, and examined, saith:*

Examined by Mr. Jacobs:

My age is fifty-nine; residence, New Cumberland, Cumberland county, Pa.; occupation, railroad agent, justice of the peace, and engaged in selling lumber occasionally.

Q. 1. Were you engaged in the lumber business at New Cumberland in the year 1870?

A. I was.

Q. 2. With whom?

A. Mr. Christian Eberly and I went into partnership on the 1st of April, 1862. I bought him out on the 10th of March, 1870. I then carried on business myself.

Q. 3. State whether or not, during that year, George W. Drawbaugh bought from you, or from Lee & Eberly, any lumber suitable for making a wagon.

A. I can give you the items that he bought, but somebody else will have to be the judge as to whether it was suitable for a wagon. I probably knew at the time what the lumber was bought for, but I don't know now.

Q. 4. Please state whether the book you now hold in your hand is your book of original entries containing charges for lumber sold during the year 1870, by the firm of Lee & Eberly, and by yourself, and, if so, point out to the examiner any charges for lumber sold to George W. Drawbaugh.

A. It was our book of original entry of the firm of Lee & Eberly, until March the 10th. After which time it was my own book of original entry. The first charge that I find on the books is for "180 ft. of boards @ 45; January the 11th, 1870, $8.10, and 54 ft. of poplar plank @ 35, $1.89."

The next charge was on "March 22d, 1870—it is 170 ft. grub plank @ 13, 2.21; 105 ft. of half inch poplar @ 25, 2.62; 50 ft. 8×4 poplar @ 25, 1.25."

There is but one charge more; that was on "May 2d, 1870, and is for 6 ft. of hickory scantling @ 25 per thousand, 15 cts."

Q. 5. Are those all the charges appearing upon your books for lumber sold to George W. Drawbaugh?

A. Yes.

Cross-examined by Mr. Storrow:

Cross-Q. 6. What was George W. Drawbaugh's business at that time?

A. I don't know; I think he was employed about the Pump Factory, so called, up at Milltown.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 11th day of July, 1881.
FRED. M. OTT,
Examiner.

JNO. F. LEE.

Adjourned until July 13th, at 10, A. M.

July 13th, 10, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

DANIEL B. MUSSER, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is thirty-four; residence, Lower Allen township, Cumberland county, Pa.; Eberly's Mills is my post-office; I am a farmer. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, and have known him ever since I was a boy.

Q. 1. State whether you ever saw any of his talking-machines at his shop at Eberly's Mills, and if so, state when you first saw them.

A. I saw one, an old tin box, that he had talked through, there, in 1873.

Q. 2. How came you to see it in 1873?

A. I had been in the shop there, and he had these things together then. He wanted me to put my ear to it, and I thought it was tomfoolery, and I was not going to be caught by it. I thought he was trying to fool me, and I would not listen.

Q. 3. Please look at the instrument "B," and state whether or not that was the instrument that you saw at that time.

A. This was the instrument.

Q. 4. Is it in the same condition now as then?

A. No, sir; not altogether.

Q. 5. What differences do you see?

A. Well, it was all plastered over inside with plaster of paris, or some white substance. There was a bladder in some shape or form at the end of it next to the magnet.

Q. 6. Do you remember whether the magnet or spools of wire were on it at that time or not?

A. Yes, sir.

Q. 7. How do you fix that time as 1873?

A. It was just the year before my wife died. It was in the summer. She died January 24th, 1874.

Q. 8. Did you ever see any talking-machines there afterwards? If so, when next after 1873?

A. In 1876.

Q. 9. How did you happen to be there in 1876?

A. I came there to the shop and wanted a reaper pitman fixed. He told me he hadn't time to fix it, and he had been showing some talking-machines at that time to some other party that was there that I did not know.

Q. 10. Is that the way you happened to see it at that time, because he was showing it to some other party?

A. Yes, sir.

Q. 11. Was it before or after the harvest of 1876 that you then saw it?

A. I could not tell.

Q. 12. Do you recollect whether you wanted to get your reaper fixed before, or after, or during the harvest?

[*Objected to on the ground that the witness's memory has been exhausted.*]

A. It was before harvest that I wanted to get it fixed.

Q. 13. How do you fix that year as the year 1876?

A. It was the first year I commenced farming after I was married the second time, which was August 15th, 1875.

Q. 14. Do you see here on the table the talking-machine which you saw there in 1876, at the time you went there to get your harvester fixed?

A. I do, to the best of my knowledge. This ["D"] is the machine that I recollect of him showing to the party that was there.

Q. 15. Did you see any talking-machines there in that shop after that time? If so, when?

A. In 1878. I had been there at the shop on a little business. I wanted to see Mr. Drawbaugh, and he was busy talking to three or

PHONE COMPANY,-1

four other men, perfect strangers to me; I did not know them. He was showing them some instruments, something that looked like this one ["H."] He had it open, if I mistake not.

Cross-examined by Mr. Storrow:

Cross-Q. 16. How long have you lived where you do now?

A. I moved there the last time in 1876.

Cross-Q. 17. Where did you live before that?

A. At Camp Hill.

Cross-Q. 18. How long did you live at Camp Hill?

A. Two years, the last time.

Cross-Q. 19. Where did you live before that?

A. Where I now live. I moved there in 1867 the first time.

Cross-Q. 20. What other talking-machines did you ever see at Drawbaugh's shop?

A. None, but what I have testified about.

Cross-Q. 21. When did you last see these before this week?

A. I saw these two machines ["D" and "B"]—I think it was last week—I ain't sure—that Mr. Drawbaugh was there to see me.

Cross-Q. 22. Was anybody with Mr. Drawbaugh last week, when he came to see you?

A. Yes, sir; Mr. Jacobs was with him.

Cross-Q. 23. When did you last see them before that?

A. I had not seen them since the times that I have stated.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 13th day of July, 1881.
FRED. M. OTT,
Examiner.

DANIEL B. MUSSER.

ISAIAH STEIGELMAN, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

I am fifty-two years old; reside at Shiremanstown, Cumberland county; I am a shoemaker. I know Daniel Drawbaugh, of Eberly's

Mills, and have known him for, I suppose, thirty-six or thirty-eight years.

Q. 1. How many times were you ever in his shop at Eberly's Mills?

A. Since he has been in the inventing business, I don't think I have been in more than once.

Q. 2. How often since 1867?

A. Only once since then.

Q. 3. When was that once?

A. August 8th, 1878.

Q. 4. Was anybody with you? If so, who, on that visit?

A. Mr. Reeser, my brother-in-law, was with me.

Q. 5. State whether you saw any talking-machines there at that shop at that time.

A. I did.

Q. 6. When I left you in Mr. Jacobs' office an hour ago, in order to examine Mr. Musser, I requested you to look over the various machines that have been used in evidence here, and if you found the machine which you saw in Drawbaugh's shop in 1878, to bring it with you when you came up to this room to testify. Have you done so?

[*Objected to as incompetent.*]

A. Yes, sir; this is the one that I saw there, and that he was showing me [indicating machine "N," which the witness holds in his hand.]

Q. 7. While you were there at the shop, at that time did you see either of the Grissingers there,—Theodore or Jacob?

A. There was a man there. They said it was a Grissinger. If it had been Theodore, I would have known the man, for I know him.

Q. 8. Did they say, while you were there—that it was a Mr. Grissinger?

A. Yes, sir.

Q. 9. Where was Mr. Grissinger, and what was he doing, at the time that you saw him?

A. They had a blacksmith fire outside there, and he was at work at it.

Q. 10. Where was the talking machine?

A. The talking-machine was inside, in one of the rooms up-stairs.

PHONE COMPANY,-1

Cross-examined by Mr. Storrow:

Cross-Q. 11. This blacksmith fire, that you speak of, was in a little shed or out-building, on the edge of the mill pond, was it not?

A. Yes, sir.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 13th day of July, 1881.

FRED. M. OTT,
Examiner.

ISAIAH STEIGELMAN.

P. B. REESER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

I am fifty-nine years of age; I reside at Shirmanstown, Cumberland land county; I am a carpenter. I know Daniel Drawbaugh, of Eberly's Mills, and have known him over thirty years by reputation. I have seen him back and forward, but didn't have any particular acquaintance with him.

Q. 1. You were here present in the room this morning while Mr. Isaiah Steigelman was giving his deposition, were you not?

A. Yes, sir.

Q. 2. Do you recollect the visit to Mr. Drawbaugh's shop about which Mr. Steigelman testified?

A. Yes, sir.

Q. 3. Do you recollect seeing the talking-machine there at that time?

A. I recollect seeing it; yes, sir.

Q. 4. Mr. Steigelman identified the instrument "N" as the one he saw. Please look at it and state your recollection about the matter.

A. As near as I could tell it was about like that.

Q. 5. Do you recollect anything about seeing Mr. Grissinger about the blacksmith shop while you were there?

A. I seen a man there they said was a Grissinger.

Q. 6. That blacksmith shop was a little shop standing close by Drawbaugh's shop, was it not?

A. Yes, sir; standing close by the shop.

Q. 7. Were you ever at Drawbaugh's shop on any other occasion except that?

A. No, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 8. Who else did you see at Drawbaugh's shop on that visit?

A. I seen one of Drawbaugh's—one of John Drawbaugh's boys—I think, working in the shop; Dan Drawbaugh was there.

Cross-Q. 9. Who showed you the talking-machine?

A. Daniel Drawbaugh himself was showing it to Steigelman; I was kind of standing back, looking on.

Cross-Q. 10. What did you and your brother-in-law go there for?

A. I went along to see some of Drawbaugh's machineries that were talked of; and I went also to see whether I could get a kind of a burr made for what we call a bench-screw.

Cross-Q. 11. What did your brother-in-law go for?

A. He went to serve a summons on a man down there, and wanted me to go along merely for company.

Cross-Q. 12. Did he go to serve a summons on a man in Drawbaugh's shop

A. Not at the shop. He lived up in the town.

Cross-Q. 13. Then, I suppose, you were the one that wanted to go to the shop?

A. Of course, I thought when I was down there I would go there, and then ask him whether he could make that for me.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 13th day of July, 1881.
FRED. M. OTT,
Examiner.

P. B. REESER.

ZACCHEUS BOWMAN, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is forty-six; residence, Camp Hill, Cumberland county; occupation, farmer. I know Daniel Drawbaugh, of Eberly's Mills, and have known him from boyhood, nearly.

Q. 1. State when and under what circumstances you first heard him speak of his talking-machine.

A. In regard to the time, I am not positive. It was in 1871, or

EPHONE COMPANY,-1

1872, along there. The sickness of his child will tell the date. It was on a Sunday that we were there. I went along with Dr. Bowman, my brother, to see the child, as it was a curiosity to be seen, and while there we saw the clock, and then, talking about the clock, Mr. Drawbaugh said: "I am working at something now—working at a machine that is to talk." That is what he told us, and we just laughed at the idea. As near as I can tell, he said it was some kind of a machine that was to talk to a distance. As we passed out, the doctor said to me: "He is always working at something." That is all that passed between us at that time. The Doctor lived next to us at that time.

[*Objected to by Mr. Storrow as hearsay and incompetent.*]

Q. 2. That visit was to Mr. Drawbaugh's house, and not to his shop, was it?

A. To his house; yes, sir.

Q. 3. Why was the child a great curiosity at that time?

A. Because it had dwindled away to skin and bone and no nourishment seemed to help it any; it was a mere skeleton.

Q. 4. Do you recollect whether the child had been sick for some time?

A. Yes, the child had been sick for some time.

Cross-examination waived by Mr. Storrow.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 13th day of July, 1881.
FRED. M. OTT,
Examiner.

Z. BOWMAN.

July 14*th*, 10, A. M.

No witnesses being produced, adjourned until 2, P. M.

July 14th, 2.45, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

J. A. MOORE, *being produced, affirmed, and examined, saith*:

Examined by Mr. Hill:

I am forty-seven years of age; I reside at Camp Hill, Cumberland county; I am principal of White Hall Soldiers' Orphans School. I known Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa., and have known him about eleven years.

Q. 1. Were you one of the firm of M. M. Grove & Co., who were in the axle business at one time in the shop now occupied by Mr. Drawbaugh?

A. Yes, sir.

Q. 2. That firm was composed of Jacob Kline, Wilson Bear, Michael M. Grove, and yourself, was it not?

[*Objected to as leading.*]

A. Yes, sir.

Q. 3. When was your said firm formed?

A. On the 23d day of December, 1874. This is the Article of Agreement of that date, which I hold in my hand. The co-partnership was formed on the same day the Agreement was written.

Q. 4. When was that co-partnership dissolved?

A. The 29th of February, 1876, is the date that it was dissolved. There was a written dissolution of partnership which I have here in my hand, and which was signed by all the partners.

Q. 5. That firm, of which you were a member, was sometimes known as the Axle Company, was it not?

A. Yes, sir; we called it the "Harrisburg Axle Company" on our advertisement. It was also known by the name of "M. M. Grove & Co." It is called in the Articles of Agreement, "Bear, Moore, Grove & Kline."

Q. 6. After the dissolution of co-partnership, on the 29th of February, 1876, state whether or not you and Mr. Grove continued the business for a short time.

A. We did. I could not say positively how long—only for a few months. I don't think it was six months.

Q. 7. Did you wind up the business of the company?

A. I did. There was a further dissolution between Mr. Grove and me. After we had run it for a few months, I took all the material and machinery and collected all accounts and paid all debts, and squared the whole thing up. I think now that it was not more than three months, that Mr. Grove and I carried it on together.

Q. 8. Do you remember about when you ceased manufacturing any of those axles or appurtenances?

A. I think, by referring to the book, I can come pretty near the time when we ceased manufacturing axles. We carried on repairing reapers after that. I take it from the last payment I made to H. K. Drawbaugh, April 21st, 1876. A few Centennial axles were made after that by Daniel Drawbaugh; at least we engaged him to make them as samples for the Centennial Exposition. Daniel had charge of the making of them. He contracted to make them perfect; he is a good machinist. I think Harman Drawbaugh worked on them—I know he did—for Daniel. I did not pay him for what he did on the Centennial axles, as the job was direct to Daniel himself.

Q. 9. Do you mean that the last of the work on the axles was done on the 21st of April, 1876?

A. I can't answer without looking at the day-book; it has been so long, I can't remember. By reference to the day-book, I find, "April 21st, H. K. Drawbaugh, Cr. by 45 hours on Centennial axles @ 15 cts., $6.75;" same day, the book shows that I paid him a check of $24.35 in full to date; that includes that and other work.

Q. 10. How long did you continue to have reapers repaired or fixed in that shop?

A. Up to the grain harvest of 1876.

Q. 11. I observe in your day-book an entry dated June 20th, 1876, of a charge to Abr. Oyster, for "patent pitman on 3 knife bars." If you remember the transaction that formed the subject of that entry, please explain it.

A. The entry is as follows:

"1876 Abr. Oyster, Dr.
June 20 To Patent Pitman,
on 3 knive bars, 10.00"

I remember the transaction distinctly. Just previous to the harvest of 1875, Wilson Bear, one of our firm, having the management of the shop at the time, desiring to test the value of this patent pitman on reapers and mowers, offered to have several of these pitmans put on neighboring reapers gratuitously. This Abraham Oyster, with others, availed themselves of the opportunity, and had the patent pitman placed on one portion of his reaper. On the following year, before harvest, I having sole control of the shop, Abraham Oyster demanded of me to have the patent pitman placed upon other portions of his reaper, to which I objected, for the reason that the firm had dissolved, and I was not holding out the same inducements as had been held out the previous year. Mr. Oyster insisted that Mr. Bear had promised him that he should have this patent pitman on all parts of his reaper needed, gratuitously. Against my protest, he had Daniel Drawbaugh make them, and refused to pay me for them, which created some altercation between us. That is my reason for remembering it. This charge in the book is for that transaction. Mr. Drawbaugh handed it to me as work done.

Q. 12. At the time when you formed the firm, on the 23d of December, 1874, had Mr. Bear and Mr. Kline, already before that date, taken any steps towards the manufacture of the axles, &c.?

A. I was well acquainted with Mr. Bear and Mr. Kline, and knew of their transactions previous to our co-partnership. I am certain that no tangible steps were taken towards the manufacture of axles by themselves. They spoke of starting a manufactory as soon as they were able to do so, or could get persons in who would have money enough to carry the thing through.

Q. 13. Did you have any knowledge of S. C. Crawford being in their employ, prior to the formation of your co-partnership, December 23d?

A. I do remember of him having acted as their agent, and with a sample axle traveling portions of the State soliciting orders.

Q. 14. To the best of your recollection, about how long before December 23d was that?

A. I would suppose about two months before December 23d.

Q. 15. Please look at the two checks, to which I now call your attention, of which the following are copies, to wit: First,

"HARRISBURG, PA., *March* 24, 1875.

Harrisburg National Bank,
Pay to Wilson Bear, or order,
Seven hundred and sixty-five dollars
for axle Co.

$765.

(Signed) J. A. Moore."

EPHONE COMPANY,-1

Having a canceled 2-cent revenue stamp. Indorsed "Wilson Bear." And secondly:

"HARRISBURG, PA., *March* 31st, 1875

Harrisburg National Bank,
Pay to Wilson Bear, or order,
For draft of Isaac H. Shearman,
One hundred and eighty dollars,
Axle Co.
$180.
(Signed) J. A. Moore."

(Indorsed) Wilson Bear.

Having two canceled revenue stamps.

Explain, if you please, whether those are original checks, given on the dates which they respectively bear, and also explain for what and how they were given.

A. These are original checks, given on the dates they bear, for which I have entries on the book. Check of March 24th, 1875, was given to Wilson Bear, to pay his draft to Isaac H. Shearman, of whom were purchased two lathes and one milling-machine, with tools for each. There is a charge in our books of the payment to Isaac H. Shearman, of seven hundred and sixty-five dollars, for two lathes and one milling-machine, the book-entry being dated March 26th, 1875. The check of March 31st, 1876, was given to Wilson Bear, for draft of Isaac H. Shearman, for one drill-press, purchased of Shearman. There is also an entry here in the book of Isaac Shearman, Dr., to draft per Wilson Bear, for one drill-press, March 31st, one hundred and eighty dollars.

Q. 16. Please look at the check, which I now show you, and which is as follows, to wit:

"HARRISBURG, PA., *March* 30, 1875.

Harrisburg National Bank,
Pay to J. W. Lescure & Co., or order,
Sixty-five $\frac{96}{100}$ dollars
[*For axle Co.*]
$\$65.\frac{96}{100}$
(Signed) J. A. Moore."

Having a canceled revenue stamp, indorsed "J. W. Lescure & Co.," and state whether that was an original check given at its date, and for what it was given.

A. This is an original check, given at its date, for belting for the use of the machinery purchased of Isaac H. Shearman and others.

Q. 17. Please permit the examiner to copy on to the record the entries of all the business transactions which are there recorded between your old axle manufacturing concern and George W. Drawbaugh.

A. I will.

[*Examiner copies the following, which he certifies to be correct:*

“1875	G. W. Drawbaugh, Dr.

Q. 20. While you were connected with the business there, did Daniel Drawbaugh ever say anything to you about his talking-machine?

A. Yes.

Q. 21. Did he show you one of his talking-machines?

A. Yes.

Q. 22. About when was it, as near as you can remember, that he first showed you his talking-machine?

A. It was during the month of May, 1875.

Q. 23. Did he say anything about patenting the machine at that time? If so, what?

A. He did. He said that he was unable to procure a patent himself, and desired me to go in with him and get a patent for it.

Q. 24. Did he offer an interest in the invention to any one who would go in and get a patent?

A. Yes; he was anxious to have some one take hold of it with him who had the means to procure a patent and put it on the market. I was so fully engrossed with our own patent axle at the time that I told him I did not wish to go into any other new inventions. I would add, further, that we had also (I mean the firm) another patent journal, used for sewing-machines, reapers, &c, which ante-dated our patent on the axle, and which we were also manufacturing.

Q. 25. At that conversation with Mr. Drawbaugh, did he or not suggest any particular line of business in which he thought the talking-machines could be introduced?

A. He spoke of the use of it in cities to supersede the fire-alarm which existed at that day.

Q. 26. Please look at the machine "B" now shown you, and state whether or not he showed you that machine in connection with that conversation.

A. I believe this to be the exact machine which he showed me during that conversation.

Q. 27. Do you recollect whether or not the end of the box next to the magnet was closed at the time of that conversation?

A. It was closed with something thin, like a bladder, drawn tightly and tied around it like a drum-head.

Q. 28. Do you remember whether or not while you were engaged in business there, he had other talking-machines around in different parts of the shop?

PHONE COMPANY,-1

A. I never saw any in use. I saw a number of pieces of wood that were carved out in different shapes. I never had any conversation with him as to their use.

Q. 29. Did you feel much interest in his talking-machine at the time?

A. I did feel considerable interested in it, and told him, if it could be put to practical use, it would be a fortune to any person or persons who would succeed in bringing it out. I can't remember the words exactly, but that is about what I said to him.

Q. 30. Did you take interest enough in it to inquire about it afterwards, or to examine any of the machines that you saw lying about there?

[*Objected to as argumentative and ambiguous.*]

A. I observed him frequently working at machinery that I thought was connected with this same machine, though put up in different styles and different shapes. I was not well enough acquainted with his objects at which he was at work, nor his designs, at the time, to give an intelligible account of their working or what they were for. I made inquiry of him as to the purpose of a machine that was on a table in another room, which worked by a magnet, and pressed certain keys with the alphabet on, but I don't know the object of it now. I didn't examine any one that had reference to this talking-machine.

Q. 31. Are you able now to identify any of the machines that had reference to his talking-machine, other than the instrument "B," now lying on the table before you?

A. I do not think I could recognize any other.

Q. 32. When Drawbaugh spoke of using the talking-machine as a substitute for the fire-alarm telegraph, did he state how he thought of using the machine—whether by batteries, or by magneto-electricity?

A. He spoke of using it, as this was used, by an electro-magnet. This is the expression I understood him to use.

Q. 33. Please refer again to your account-books, and point out to the examiner whatever accounts may be there with Henry B. Musser, in order that it may be copied upon the record.

A. Here is a charge against Henry B. Musser, June 28, 1876, Dr.

To Pitman, one head and two heels,	15.00
" one new cast wheel,	75

That is all the account there is against Henry B. Musser on the books.

Q. 34. When was that account paid by Mr. Musser?

A. The credit is as follows:

1876. Henry B. Musser, Cr.

Aug. 29,	By cash for Pitman connections,	15.75

Q. 35. In what year was that paid?

A. In 1876, as shown by the entries in the books.

Q. 36. Do you know whether Mr. Drawbaugh is a man of bold and aggressive character, or whether he is an extremely sensitive and diffident man in his relations with people with whom he is not on terms of close intimacy, and in his business relations?

A. I know him to be the latter, extremely.

Q. 37. Have you been at Drawbaugh's shop since you closed your connection with the business there?

A. I have not, since I sold the machinery to Mr. Chellis.

Cross-examined by Mr. Storrow:

Cross-Q. 38. When did you sell the machinery to Mr. Chellis?

A. I could hardly answer that correctly, without referring to some other items in my book which refer to the sale. I have not that book here.

Cross-Q. 39. How much time elapsed between closing out the active part of your business and your sale to Mr. Chellis?

A. About three years and a half, I would suppose.

Cross-Q. 40. The paper of February 29, 1876, to which you have referred as the paper of dissolution, is the one, I suppose, which put the business into the hands of Mr. Grove and yourself, is it not?

A. Yes, sir.

Cross-Q. 41. Another paper, which you have produced, dated November 18th, 1876, transfers all the property to you, upon your promise to pay the debts. Did you go on under that paper and pay the debts and dispose of the property?

A. Yes, sir; that is correct. I could not tell the exact period between the first dissolution and the second. I thought it was about six months. In fact, from the spring of 1876, I had practically the whole concern in my hands. In fact, during the whole time, I was the only one who was solvent, and I took charge to wind up the concern to secure myself.

Cross Q. 42. You were treasurer of the concern from the outset, were you not?

A. Yes, sir; I acted as secretary and treasurer both.

Cross-Q. 43. Did Daniel Drawbaugh do any work for you after the beginning of March, 1876, and while you were attending to the business of repairing reapers during the harvesting season of 1876?

A. He did that of making those samples for the Centennial Exhibition, and repairing reapers; very little other business. I think he finished ten sets of axles during that period.

Cross-Q. 44. I don't find any work credited to him after March, 1876, in the account which was settled April 1st, 1876. Where is the credit for the work he did?

A. No, sir; I never had a settlement. I have his bill somewhere, which about squares the account. It was never carried on to the books.

Cross-Q. 45. How long have you had charge of the orphans' school?

A. I assumed control of it November 1st, 1867. The building belongs to me, and the State pays me a certain sum *per capita* for all expenses attending the maintenance and instruction of the scholars. From March 1st, 1875, to March 1st, 1877, I sold my controlling interest to another party, and resumed it again at the latter date.

Cross-Q. 46. How large a school is it?

A. I have at present two hundred and thirty-four pupils.

Re-direct by Mr. Hill:

Q. Q. 47. Was your Axle Company enterprise a financial success, or otherwise?

A. It was a financial failure. It was during the heavy depression in 1874-'5, and '6, and was the worst time that anybody could go into business.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 14th day of July, 1881.

FRED. M. OTT,
Examiner.

J. A. MOORE.

Adjourned until July 15th, 1881, at 10 o'clock, A. M.

July 15*th*, 11, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel as yesterday.

W. N. KLINE, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

I am forty-four years of age; I reside at Shiremanstown, Cumberland county; I am an insurance agent. I know Daniel Drawbaugh, of Eberly's Mills, and have known him since the 17th day of July, 1867. On that very day I got acquainted with him.

Q. 1. How do you fix the fact that you got acquainted with him on that day?

A. He was the patentee of a molasses faucet and a pump, and on that day I went to work for the Stevensons, and they were at work on the patterns, and he showed me how to make the patterns—explained the draft to me.

Q. 2. When did you first have any conversation with him about his talking-machine, or about the possibility of one man's talking to another while they were at a great distance apart?

A. Some time in the year 1867 or in the year 1868. I could not tell the exact time. We were putting up those faucets. They didn't appear to fit right. By blowing into those faucets, it made a peculiar sound. Then Mr. Drawbaugh said that the time would come that we would talk face to face at a great distance.

Q. 3. Do you mean, talk at a great distance, as though you were talking face to face?

A. Yes, that was the expression he give.

Q. 4. Did the peculiar sound in the faucet give rise to a talk on the character of sound—what makes sound, &c., and how it is made?

A. I am not so positive about the conversation, but I think that is what brought it about.

Q. 5. How do you fix that time as in 1867 or the beginning of 1868?

A. By the Time Books.

Q. 6. Did you do any work on the faucets after the spring of 1868, so far as you remember?

A. No, sir.

Q. 7. Did Mr. Drawbaugh say anything to you at that time about making experiments with a view to enabling a person to talk to another to a distance?

A. Not to my recollection.

Q. 8. When did you next have any conversation with him about talking to a distance as if face to face?

A. In the fall of 1877.

Q. 9. How do you fix that time?

A. I was building Mr. Wilson Bear's barn at Camp Hill that fall, and one evening, as I was about ready to go home, I met Mr. Drawbaugh on the pike, and we came into conversation. He was then telling how his talking-machine was working, and I questioned him then how he could talk such a distance as he said. He said it was done by electricity. Then he explained it fully to me as to how it works, but said he was too poor to get it patented; that if he could get some help, there was money in it. That is about all the substance of that.

Q. 10. Did that conversation occur while you were walking along on the road from Camp Hill to your destination?

A. Yes, sir: that occurred from Camp Hill to White Hill station, and at White Hill station we stood a long time and talked on the subject.

Q. 11. When and where did you ever see any of his talking-machines?

A. I saw his machines at his shop in the spring of 1879.

Q. 12. Was that the first time you had been at his shop since you worked on the old faucets that were made for the Company of which Mr. Gorgas was a member?

A. Yes, that was the first time. I had never been at his shop at all before.

Q. 13. Then you did not work for Mr. Gorgas' Faucet Company?

A. No, sir; I was working for another firm that made the patterns for the Gorgas Faucet Company.

Q. 14. Did Mr. Drawbaugh show you quite a number of talking-machines when you were at his shop in the spring of 1879, or not?

A. Yes, sir; he showed me quite a number.

Q. 15. Did he talk to you through any of them?

A. Yes, sir.

[*Question objected to as leading.*]

Q. 16. Please look at machine "P," now on the table before you, and state when and where you first saw that machine.

A. I saw this machine in 1879, in the spring, at Daniel Drawbaugh's shop. He showed it to me.

Q. 17. Are you able to identify the machine that you listened at when he was talking to you at that time?

A. Yes; it was a machine like this one here ["P."] If this ain't the machine, it was one just like it.

Q. 18. Show us how you used the machine, in listening.

A. I took this here, [witness takes up the mouth-piece attached to the free end of the flexible tube,] and put it right to my ear, and he talked into the short tube on the other side of the machine. That is the way I think he did.

Q. 19. Was the flexible tube of the same length as now, or not?

A. That I could not say. There was a short one, that he had in the first place. This was first. Then I put this to my left ear, and then I could not tell any more what he said. I mean, I don't remember the words that he spoke through it. Then he put it to my right ear, which is my deaf ear. Afterwards he wanted to show it more distinctly, and he took this tube off and he put a longer one on—perhaps six or eight feet long—and I put that to the ear in which I am hard of hearing, and he spoke into the other side of the instrument and said that Harrisburg was situated on the banks of the Susquehanna river. This was on the deaf ear. It was as distinct as could be. That is what makes me remember it, because I had not heard anything in that ear since I was a young man.

Cross-examined by Mr. Storrow:

Cross-Q. 20. Where did you live between 1867 and 1879?

A. In Harrisburg, and New Cumberland, Cumberland county.

Cross-Q. 21. When did you move to Shiremanstown?

A. In the spring of 1880.

Cross-Q. 22. Did you ever meet Drawbaugh between the time when you worked on the faucet patterns and the fall of 1877?

A. Yes, sir.

Cross-Q. 23. About how often?

A. That I can't tell.

Cross-Q. 24. Was it just once, or was it tolerably often?

A. I couldn't say whether it was one dozen or two dozen times that I met him in that time, because I met Drawbaugh often, but never had any conversation with him particularly on any subject.

PHONE COMPANY,-1

Cross-Q. 25. You say that when you met him on the road, and talked with him there in the fall of 1877, he explained to you "how it works." Tell me what that explanation was.

A. I couldn't just exactly go over the words any more. I rather disbelieved that you could hear the sound, and that you could understand at that distance, without tapping something like a telegraph. And then he said you could just speak into a tube, like I found it afterwards, and you could hear at the other end the very word that was spoken in.

Cross-Q. 26. Was that substantially the explanation he gave you of how it worked?

A. That is, to the best of my recollection now.

Cross-Q. 27. Please tell me anything else he ever said to you about talking-machines.

A. I don't know anything else in particular, except what he said at first in 1867, that I have already given.

Re-direct by Mr. Hill:

Q. Q. 28. When you had the conversation with him on the road in 1877, did he give you any idea how far he could talk from one person to another, so as to be understood, through his machine?

A. Yes, sir; I thought it was any distance, the way that he expressed himself.

Q. Q. 29. Did he say anything about its being used in place of the telegraph?

A. Yes, sir; he said it would be more convenient and cheaper than the telegraph.

Re-cross by Mr. Storrow:

Re-cross-Q. 30-31. When I asked you to tell me everything else he ever said to you about talking-machines, why didn't you tell me what you have just said in answer to Mr. Hill's question?

A. That is because I thought that your question related to the time between 1868 and 1877. There are many other things that I might tell, if the question was asked that would just hit upon the matter, and I could understand it.

Re-cross-Q. 32. Now, tell me everything else he ever said to you at any time about talking-machines.

A. That I couldn't do.

Re-cross-Q. 33. Tell me anything else he ever said to you at any time about talking-machines.

A. If the question is directly asked, I could answer directly, but the question is indefinite to me now. I don't know what to answer, I might, perhaps, know some things I did not say. If I was asked the question, I could tell you.

Re-cross-Q. 34. If you remember anything else he ever said to you about talking-machines, please to state it.

A. I don't just have any special knowledge just now, but, as I said before, there might be things that I have forgotten, and that if my mind was just drawn to it I could tell.

Re-cross-Q. 35. Do you remember anything else that he ever said to you about talking-machines?

[*Objected to, as already answered fully two or three times.*]

A. The answer above would do for that same question again, I suppose; because I answered that two or three times.

Re-cross-Q 36. Ain't you able to answer that question directly, yes or no?

A. I answered it to the very best of my recollections.

Re-cross-Q. 37. Please tell me anything else you remember that he ever told you about talking-machines.

A. I have answered that as complete as I was able. I couldn't answer yes or no, because I might have forgotten something, that, if my mind was carried to it, I would know it.

Re-cross-Q. 38. Can't you say anything else that he ever told you about talking-machines?

A. I don't think it is necessary for me to answer that question, because I have answered it so often already.

Re-cross-Q. 39. Is that the best answer you choose to give?

A. That is the best I can give under oath.

Re-cross-Q. 40. Was your oath to answer such questions as you thought necessary, or such as should be put to you?

[*Question objected to, as merely badgering the witness, he having already several times testified that he had given his best recollection of all conversations, but there might have been other things said in some of those conversations that he might be able to recollect if his mind was particularly drawn to them, but not otherwise.*

Counsel for complainants says, he wishes to find out what this witness's memory is worth when he is not subjected to leading questions.]

A. To tell the truth to the best of my recollection.

Examination taken, reduced to writing, and by the witness affirmed to before me, this 15th day of July, 1881.

FRED. M. OTT,
Examiner.

W. N. KLINE.

Adjourned for dinner until 2, P. M.

Examination resumed at 2, P. M., pursuant to adjournment.

Present, same counsel.

JACOB G. LANDES, *being produced, affirmed, and examined, saith:*

Examined by Mr. Jacobs:

My age is fifty-eight; my residence is Mechanicsburg; I am working at pattern-making here in Harrisburg, at the Harrisburg foundry and machine shops, on Allison's Hill, a branch of the Harrisburg car shops. I know Daniel Drawbaugh, of Eberly's Mills; I became acquainted with him in 1836, about the time my father moved to Eberly's Mills.

Q 1. Do you remember when Daniel Drawbaugh moved to Mechanicsburg?

A. He moved there in the spring of 1876.

Q. 2. In what month, if you recollect?

A. I think it was in the latter part of March.

Q. 3. Please state whether or not you had any conversation with him about his talking-machine soon after he moved to Mechanicsburg, and if so, how soon.

A. Yes, sir; we had a conversation. He told me about it, and it must have been not more than two weeks after he moved there; at least, not more than the second week in April.

Q. 4. Please give us that conversation as nearly as you can recollect it.

A. He told me that he had made a machine. He called it a talking-machine, or speaking-machine; I don't know which of those words he used. He said that he had tested it, and that he could hear distinctly—the distance of the length of Mechanicsburg was the distance he gave—

just as distinctly as though a person was talking in a room. That is about the idea he gave of it.

[*Answer objected to by Mr. Storrow as incompetent and irrelevant.*]

Q. 5. Did he tell you how far it could be used?

[*Same objection.*]

A. He spoke as if it could be used a thousand miles.

Q. 6. Did he describe the instrument to you pretty fully?

A. He gave me a description of it, but I couldn't get over it, more than he said that it worked by electricity.

Q. 7. With reference to its use, did he, or not, make any comparison between it and the telegraph?

A. Yes; he said it would take the place of the telegraph.

Q. 8. Did he, or not, say anything about taking out a patent on it? If so, what did he say?

A. He said he would like to take a patent out on it, and would take a patent out on it, if he could secure the means; or something of that kind.

Cross-examined by Mr. Storrow:

Cross-Q. 9. Did you ever have any other talk with Drawbaugh about his speaking-machine?

A. Yes, sir.

Cross-Q. 10. When was it?

A. It was some time after this conversation. It might have been six or eight months, that he said he was going to get it patented. He then expressed nothing concerning the means. He said that he had it so that he was going to get it patented.

Cross-Q. 11. Did you ever have any other conversation with him about it?

A. We have had conversations time and again, but I couldn't tell you when, nor to what extent. We had a conversation last fall. Then he showed me his talking-machine; that was the first time I had seen it.

Cross-Q. 12. Where was this conversation last fall?

A. In his shop at Eberly's Mills.

Cross-Q. 13. Who else was present?

A. There was his brother and one of his brother's sons there, and another young man that I didn't know. Mr. Chellis was there also, but only came after he had shown me this machine.

PHONE COMPANY,-1

Re-direct by Mr. Jacobs:

Q. Q. 14. In the second conversation which you have spoken of, six or eight months after the first, when he told you he was going to get the talking-machine patented, did he, or not, say that he then expected some one to help him ?

A. He spoke of having received assistance, or received some person to stand at his back, or something of that kind. I don't exactly recollect the words that he used.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 15th day of July, 1881.
FRED. M. OTT,
Examiner.

JACOB G. LANDES.

Adjourned for want of witnesses at 3.30, P. M., until July 16th, at 10, A. M.

July 16th, 11, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel as yesterday.

JOHN K. TAYLOR, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is almost fifty-five; residence, Lower Allen township, within about a mile and a half of Eberly's Mills, Cumberland county; I am farming and trucking. I know Daniel Drawbaugh, and have known him since 1846. I haven't been about him much until about 1851. After that I lived right in the same village until 1860, when I moved away.

Q. 1. Did he pay you any money in the year 1867?

A. Yes, sir.

Q. 2. At what time in the year 1867?

A. About the middle of September.

Q. 3. After the Faucet and Pump Company commenced operations, or before ?

A. Yes, sir; they were in operation at the time.

Q. 4. How much did he pay you ?

A. I can't tell exactly, but it was between two and three hundred dollars, if my memory serves me aright.

Q. 5. Was it the balance of an old debt that had been due several years?

A. Yes, sir; it was the balance of an old debt that he had owed me for some years.

Q. 6. Do you remember being at his shop with Mr. Ezekiel Worley at one time?

A. Yes, sir.

Q. 7. How long ago was that?

A. As near as I can remember, it was eight years, if not more. It has not been under eight years.

Q. 8. Did he show you any talking-machines at that visit?

A. Not that I recollect of. He was telling us about his talking-machine.

Q. 9. What do you remember that he told you about it?

A. I don't remember anything more than that he was telling about the talking-machine—by electricity, or something of that kind.

Q. 10. Was that before or after Mr. Miller moved away from Eberly's Mills?

A. As near as I can remember, it was before.

Q. 11. How many times have you been at the shop since that visit?

A. I have been there twice, or so, that I can recollect of.

Q. 12. Did you stop long, or not?

A. I was there for a very short time.

Q. 13. Was Mr. Drawbaugh there?

A. He was there once, that I recollect of, and once that I was there, he wasn't there, I think—I am sure he wasn't.

Q. 14. What was he doing the once that he was there?

A. Him and a man I was not acquainted with, were making patterns for a faucet.

Q. 15. How long ago was that?

A. It was within the last two years.

Cross-examined by Mr. Storrow:

Cross-Q. 16. Don't you think you have been there more than twice in the last two years?

A. Those two times I recollect my errand; I might have been there oftener, but I don't recollect of it.

Cross-Q. 17. Did you ever meet Drawbaugh within the last eight years outside of his shop?

A. Yes, I have come across him.

Cross-Q. 18. Did you ever have conversation with him about talking-machines other than what you have already stated?

A. I think we had some, the last year or so; before that I don't think we had, because I saw him so very little. The election is held at my place, and I would generally see him when he came to elections. I might have, perhaps, seen him between those times occasionally. I would just exchange a word or two with him—that is all.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 16th day of July, 1881.
FRED. M. OTT,
Examiner.

JOHN K. TAYLOR.

Adjourned until 2, P. M.

Examination resumed at 2.30, P. M., pursuant to adjournment.

Present, same counsel.

WILSON BEAR, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is forty-one; residence, Camp Hill, Cumberland county; occupation, dealer in cattle. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, and have known him about eighteen or twenty years.

Q. 1. Are you the Wilson Bear who was in partnership with Messrs. Jacob Kline, M. M. Grove, and J. A. Moore in the axle business?

A. Yes, sir.

Q. 2. Prior to taking Mr. Grove and Mr. Moore into that partnership, you and Mr. Kline had become interested together in the patent on the harvester crank-pin or spindle, had you not?

A. Yes, sir.

Q. 3. At what time did you and Mr. Kline become interested together in that patent?

A. The 19th day of June, 1874.

Q. 4. State whether or not you had Mr. S. C. Crawford in your employ before Mr. Grove and Mr. Moore became interested in the business.

A. Yes, sir; I had.

Q. 5. If you have your original account-books here, please refer to them, and point out to the examiner all the payments made by you to

Mr. Crawford, prior to December 23, 1874, in order that he may copy them upon the record.

A. "November 13, 1874, Samuel Crawford to C. $2.45; November 21, Sam Crawford to cash, $2.00." Those two items are the only ones prior to that date. After December 23d, Mr. Crawford is charged with some payments made by me on account of work done prior to that date. The charge of November 13th, 1874, is the first payment made to Mr. Crawford.

Q. 6. When did Mr. W. Kline build a barn for you?

A. In the fall of 1877.

Q. 7. What is the first payment to him, on that account, shown by your book?

A. November 10th, 1877.

Q. 8. Were you ever at Mr. Drawbaugh's shop prior to becoming interested with Mr. Jacob Kline in the patent above referred to?

A. I don't know that I was.

Q. 9. Between the time when you became interested with Mr. Kline in that patent and the time when the affairs of the Axle Company were wound up, did you know anything about Mr. Daniel Drawbaugh having a talking-machine invention?

A. I know of him showing me, in one of the rooms of the building,—a place in the building, as I remember that he did not invite every one into, to show his inventions. I remember of seeing wires in this room. The recollection of them that I have is that they ran down through the floor, and I remember of seeing other machinery, and cannot say exactly what they were to be used for, as I take very little interest in patent-rights. I have no doubt, as Mr. Drawbaugh has explained to me often about his inventions, that he spoke of his talking-machines.

Q. 10. Have you any recollection, or impression on your mind, of Mr. Drawbaugh's asking you to take an interest in his invention of a talking-machine, and furnish capital for patenting and introducing it?

A. I have a faint recollection.

Q. 11. What is your impression as to the time when you did that?

A. At the time when we were manufacturing axles—the Axle Company.

Cross-examined by Mr. Storrow:

Cross-Q. 12. What explanation did he give you about his invention?

A. Mr. Drawbaugh often explained to me about his inventions, and told me about them, but I was so little interested in these things that I really paid no attention to them, and can't tell now what his explanation was. I remember seeing one of his instruments.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 16th day of July, 1881.
FRED. M. OTT,
Examiner.

WILSON BEAR.

DANIEL FETTROW, *re-called, saith:*

Re-cross examination by Mr. Storrow:

Re-cross-Q. 1. Please to tell me the names of the people who lived at Eberly's Mills in 1874–'5 and '6.

A. That is a question that I can't answer just now, because there were changes in every year.

Re-cross-Q. 2. Tell me who you remember that lived there in those years.

A. I lived there. I could tell by reference to the charges in my books. J. B. Drawbaugh lived there—does yet. William Heck, Daniel Drawbaugh, [*at Mr. Storrow's request the books of witness are sent for and brought in. Witness then continues:*] Daniel Hart, John Rennard, lived there in 1874 and '5; Geo. W. Drawbaugh lived there ever since I am there. Dellinger lived there in 1878. If I had known you wanted that, I guess I could have helped you out with the whole of it. The books I kept my smaller charges in are not here.

Re-cross-Q. 3. Will you please send in to the magistrate, to be annexed to your deposition, a list of the people who lived at Eberly's Mills in 1873, '4, '5, and '6, using your books to assist your recollection, if you want to, but including the people whom you remember as having lived there, even though you did not do any work for them?

A. I will do that.

Re-cross-Q. 4. Do you remember an explosion of gun powder that took place in the store there, and if so, when was it?

A. I remember of it. I can't tell, till I go back and see the date. Then I can.

Re cross-Q. 5. Will you please add that date to the other information that you are going to bring?

A. I will do that.

Re-cross-Q. 6. Do you remember Mr. H. C. Springer, a shoemaker, who used to live there?

A. Yes, sir.

Re-cross-Q. 7. Where was his shoemaker-shop?

A. Right opposite from my shop, across the street.

Re-cross-Q. 8. Did he live in the same building where his shop was?

A. No.

Re-cross-Q. 9. Where did he live?

A. He lived further down town.

Re-cross-Q. 10. Did you know a man by the name of John Weber?

A. Yes, I knowed one by the name of John Weber.

Re-cross-Q. 11. Was he a relation or connection of H. C. Springer?

A. I can't tell that. I never made any inquiry.

[*Examination of Mr. Fettrow suspended. July 16th, examination resumed.*]

[*Mr. Fettrow says.*] I name the following persons as inhabitants of Eberly's Mills, in addition to those already named.

George Leonard came in 1871 and left in 1877.
E. F. Gilbert, 1867 'till now.
Jacob K. Metz, 1874 'till 1875.
Jeremiah Fry, 1873 'till 1880.
Wm. S. Dellinger came in 1876, left April, 1881.
Amos Frownfeldter " " 1871, " in 1873.
John Rennard " " 1874, " in spring 1876.
H. C. Springer " " 1876, left in the fall.

The store exploded in 1874, in December, or in January, 1875.

Re-re-direct by Mr. Hill:

Q. Q. Q. 12. Captain Moore, who was connected with the Axle Company, was a son-in-law of Jacob Kline, was he not?

A. Yes, sir.

Q. Q. Q. 13. Mr. Kline had another son-in-law named Bowman, hadn't he?

A. Yes, sir, he had; but I don't know which Bowman it is, whether Harry or George; I think it is George.

Q. Q. Q. 13½. You have put down Jeremiah Fry as residing there

EPHONE COMPANY,-1

from 1873 'till 1880. Mr. Fry testifies that he moved there about the last of March, 1875. Who do you think is correct, you or Mr. Fry?

A. I have got him charged in my book that I had over here for work done in 1873. That is where I got it, or else I am very wrong, if it was not in 1873. In 1876, I took possession of the property that I own now, and he lived in a house right opposite to me, that is now torn down, one year. Then he moved to the new store-house one year, and I think from spring to July, somewheres along there—I am not positive about that. Then he moved into my house, and lived the balance of the year there. From there he moved across to another house in the spring. I am not sure whether he lived there the whole year or not; but then he moved back to the store house again.

Q. Q. Q. 14. Please get your book and show me the entry charged in 1873.

A. It is in the little book that I took home; I haven't it with me now.

Q. Q. Q. 15. Will you produce it at some time hereafter for further examination?

A. I will.

[*Re-re-direct examination of Mr. Fettrow suspended.*]

Re-re-direct examination of Mr. Fettrow resumed by Mr. Hill:

Q. Q. Q. 16. Since the adjournment this morning, you came to me and stated that you wished to make a correction in your testimony as to Mr. Jeremiah Fry. You have now the opportunity to do so.

A. Fry is correct as to 1875. That is right. The way I came to find it out, I bought hogs at his sale, for Mr. Daniel Drawbaugh, and Drawbaugh got Jacob Metz's horse and sled to fetch the hogs, and Metz lived, at the same time, in Milltown. I guess that is all. The charge in the book, found to be 1873, is that I done work for him when he lived on Oyster's farm, before he moved to Milltown, and when I hunted the dates up, I did not think of that charge made before he moved to Milltown.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 16th day of July, 1881.
FRED. M. OTT,
Examiner.

DANIEL FETTROW.

Adjourned until Thursday, July 21st, 1881, at 10, A. M.

Thursday, July 21st, 10.30, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants and Mr. Hill and Mr. Jacobs for respondents.

WILLIAM SENSEMAN, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is forty-three years; residence, Boiling Springs, Cumberland county; occupation, dealing in horses at the present time. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, and have known him since the spring of 1872.

Q. 1. Did you formerly live at Eberly's Mills? If so, from what time to what time?

A. I did. From the spring of 1872 to April, 1873; from April to April.

Q. 2. In renting real estate in Cumberland county, is it the custom to rent from the first of April to the first of April?

A. That is the custom; yes, sir.

Q. 3. While you were living at Eberly's Mills, were you ever in Daniel Drawbaugh's shop there?

A. I was; different times.

Q. 4. State whether you have ever been in his shop since you moved away from Eberly's Mills, the first of April, 1873.

A. I have not.

Q. 5. While you were living at Eberly's Mills, did you have any conversation with Mr. Drawbaugh about his talking-machines?

A. Yes, sir.

Q. 6. Did he at that time, while you lived there, show you any of his talking-machines?

A. He did.

Q. 7. Did he talk to you through any of them, or not?

A. He did; through a small tube, or tin can, or something he had, from a small room up-stairs.

Q. 8. Where were you and where was he, while he was talking?

A. I was down in the cellar, or basement, or something of that kind; he was in a small room up-stairs.

Q. 9. Was he on the next floor above the cellar?

A. No, sir; on the second floor above the cellar.

Q. 10. Could you hear and understand through the machine what he said to you?

A. I could hear, and some of the words I could understand.

Q. 11. Please look at the machines "B," "F," "C," and "I," and state whether you ever saw them before, and if so, when and where you first saw them.

A. Those are the machines I seen in the shop there, or up-stairs in that room where he generally worked.

Q. 12. While you were living there at Eberly's Mills, was Mr. Drawbaugh working and experimenting with his talking-machines, or not?

A. He was.

Cross-examined by Mr. Storrow:

Cross-Q. 13. Were these four instruments in the same condition when you saw them that they are in now?

A. Very nearly.

Cross-Q. 14. What was the difference?

A. I couldn't say. They look about the same to me that they did when I seen them. I didn't examine them closely.

Cross-Q. 15. What other machines did you see there that you understood were talking-machines?

A. I don't remember seeing any others, particularly, there, except these I remember very well.

Cross-Q. 16. How often did you go to his shop while you lived there?

A. I can't say. I used to go there frequently. I only lived about a half mile from there.

Cross-Q. 17. Was it one of these instruments you listened at on the occasion you have described?

A. I suppose it was. Of course, I was down-stairs, and they were up.

Cross-Q. 18. Did you take the instrument in your hand and put it to your ear, when you listened at it?

A. No, sir; I did not. I just put my ear to the instrument.

Cross-Q. 19. Was it one of these instruments you put your ear to?

A. That I can't say positively. You know it was in 1873.

Cross-Q. 20. Was the instrument you listened at like one of these four? If so, which one?

A. It was something of the kind. I wouldn't say positively it was one of them.

Cross-Q. 21. How did he come to talk to you on that occasion?

A. I used to visit him, and he told me his idea was to convey sound, and he thought he could do it. That he had made different machines, but had never made anything out of it.

Cross-Q. 22. And it was after the talk between you about conveying sound, and after you and he had conversed several times about what he had done, that he talked through the machine to you, was it?

A. Yes, sir.

Re-direct by Mr. Hill:

Q. Q. 23. In your 21st cross-answer, you say he told you he had made different machines, but had never made anything out of it. What kind of machines—talking-machines, or other machines?

A. That he didn't say.

Q. Q. 24. What do you mean by his never making anything out of it?

[*Objected to for the reason that it is for the witness to state what he heard, and not to construe it.*]

A. That he had invented different machines, but was always too poor to carry it out and to get a patent on it.

Q. Q. 25. Is that what he said?

A. That is what he told me.

Q. Q. 26. Then, by never making anything out of it, did you understand him to mean that he had never made any money out of it?

[*Objected to as above, and as leading.*]

A. Yes, sir; that is what he was telling me.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 21st day of July, 1881.
FRED. M. OTT,
Examiner.

WM. SENSEMAN.

WILSON N. MILLER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is twenty-five; residence, Shiremanstown, Cumberland county; occupation, clerking. I know Daniel Drawbaugh, of Eberly's Mills, and have known him since 1873, personally, but knew of him before that.

Q. 1. What is your father's name?

A. J. R. Miller.

Q. 2. Did your father formerly run the mill situated a short distance above Eberly's Mills, on the Yellow Breeches creek, and known as Miller's mill?

A. Yes, sir.

Q. 2½. How far is Miller's mill above Eberly's Mills?

A. I guess not more than two miles.

Q. 3. From what time to what time did your father run the mill known as Miller's mill?

A. From 1866 to the month of March, 1873.

Q. 4. What did your father do after he left the Miller's mill?

A. Went into the forwarding business, at Shiremanstown, and also run the mill at Milltown.

Q. 5. How long did he run that mill at Milltown?

A. One year. During that year, he had a partner with him—George Eichelberger. The firm was known as Miller & Eichelberger.

Q. 6. Do you remember the date when that firm ceased to run that mill at Eberly's Mills?

A. The first of April, 1874.

Q. 7. Do you know a man named Jeremiah Kohler?

A. I do.

Q. 8. Was he employed at any time by your father, or by the firm of Miller & Eichelberger?

A. He was, by both parties. He was employed before he went to Eberly's Mills, and after he went there.

Q. 9. Do you mean that he was employed at Miller's mill by your father?

A. He was employed at Miller's mill by my father, and at Eberly's Mills by Miller & Eichelberger.

Q. 10. Up to what time was he employed at Eberly's Mills by Miller & Eichelberger?

A. I think he was there during the whole time, up to the first of April, 1874.

Q. 11. Was your father, at one time, railroad station-agent at White Hill station?

A. No, sir.

Q. 12. You were the station-agent there at one time, were you not?

A. Yes, sir.

Q. 13. From what time to what time were you station-agent there?

A. From June, 1876, to April, 1878.

Q. 14. Prior to June, 1876, were you employed at the station there?

A. No, sir; I wasn't employed at the station, but at the warehouse, close by the station, and run by my father.

Q. 15. When did you first begin to be employed at said warehouse?

A. In January, 1876.

Q. 16. Were you employed there until you became station-agent at the railroad station?

A. Yes, sir; and then I continued to be employed at both the station and warehouse.

Q. 17. Where was your father employed during that time, from January, 1876, to April, 1878?

A. He was in the forwarding business for himself, at Shiremanstown and White Hill. I was employed by him at White Hill.

Q. 18. Do you recollect the fact that Daniel Drawbaugh resided at one time in Mechanicsburg?

A. I do.

Q. 19. Did he used to go back and forth on the railroad from Mechanicsburg to White Hill during that time?

A. Yes, sir.

Q. 20. Do you recollect the fact of his showing you a talking-machine that he had in his hand as he was about to take the train at one time, while he lived at Mechanicsburg?

[*Objected to as leading and assuming.*]

A. He had a talking-machine one evening as he took the train to go to Mechanicsburg.

Q. 21. Did you have any conversation with him about it at that time?

A. Yes, sir; but I don't remember what it was.

Q. 22. While he was living at Mechanicsburg, did you have any conversation with him about furnishing a talking-machine for you for use for your business purposes?

[*Objected to as leading.*]

A. Yes, sir; he said he would put up a line between White Hill and Shiremanstown, if I could get the use of the poles.

Q. 23. What poles?

A. The telegraph poles along the railroad.

Q. 24. For whom did he propose to put that line—for whose use?

A. For our use—in my father's business.

Q. 25. Where were the instruments to be located?

A. Nothing was said about that. I was to have one at White Hill, and my father was to have the other at Shiremanstown; but nothing was said as to whether the instrument was to be put in the station or warehouse.

Q. 26. State the substance of that conversation, as nearly as you remember it.

A. I asked him about what it would cost to put a line up there, and whether he thought that we could use it that distance. He said we could and a great deal farther than that. He said he didn't know at that time what it would cost. He said afterwards that it would cost twenty-five dollars or thirty dollars, if we could get the use of the poles. I promised him I would find out whether we could get the use of the poles, and at the same time I was doubtful whether I would stay there any length of time. I never made any inquiry about the poles. He asked me several times whether I saw those parties about the poles. I told him I did not, but kept him under the impression that I would.

Q. 27. Who was to furnish the wire and the instruments in case you got possession to put up the line?

A. He said he would furnish everything—Drawbaugh.

Q. 28. Prior to his showing you the instrument at the railroad station, had you ever had any conversation with him about his talking-machines?

A. Yes, sir; but I was so little interested that I don't know what it was any more. I might say that my business there was about some money that he owed my father for coal. In the conversation, I found that he had no money, and I didn't ask him for it.

Q. 29. Referring to the time when he showed you the talking-machine at the railroad station, do you remember whether that was about the time when he first began to live at Mechanicsburg, or not?

A. I don't remember.

Q. 30. Referring to the time when you first talked about putting up the line from White Hill to Shiremanstown, do you remember whether that was about the time when he first began to live at Mechanicsburg, or not?

A. I don't remember. It was in the summer, but I can't remember what month.

Cross-examined by Mr. Storrow:

Cross-Q 31. Please to describe the instrument you say he showed you at the station.

A. I don't know whether I can, exactly.

Cross-Q. 32. Tell me what you remember about it.

A. It was a small wooden box, with a tube to it, to talk in. As near as I can tell, it was about five or six inches across, and about an inch and a half thick.

Cross-Q. 33. In your twenty-eighth answer, you testified about furnishing the wire and the instruments, that Drawbaugh said he would furnish everything. Who was to pay?

A. I was; when I say everything, I do not include the poles.

Cross-Q 34. When did you first talk with Drawbaugh or any of the counsel about testifying in this case?

A. That was in the winter, but I don't remember what time.

Cross-Q. 35. Did you make an affidavit at that time or any time?

A. I made an affidavit as to the time when my father moved from Miller's mill to Shiremanstown.

Cross-Q. 36. Did you say anything in that affidavit about any talk with Drawbaugh about his talking-machine?

A. No, sir.

Cross-Q. 37. Did you say anything to Mr. Drawbaugh or Mr. Jacobs at that time about having had any talk with him concerning his talking-machine, or concerning the line?

A. No, sir.

Cross-Q. 38. When did you first tell any of them about this talk with Drawbaugh concerning the talking-machine or concerning the line?

A. I didn't tell them anything about the line, until to-day I called their attention to it.

Cross-Q. 39. Where were you to day when you called their attention to it?

A. In Lawyer Jacobs' office.

Cross-Q. 40. At Mr. Jacobs' office, did they show you any machines which they said were Drawbaugh's talking-machines?

A. Yes, sir.

Cross-Q. 41. Is your father living?

EPHONE COMPANY,-1

A. Yes, sir.

Cross-Q. 42. Is Mr. Eichelberger living?

A. Yes, sir.

Cross-Q. 43. Where did Jeremiah Kohler go to after he stopped working for the firm at Eberly's Mills?

A. He went to Shiremanstown.

Cross-Q. 44. Did he continue to work for your father?

A. No, sir.

Re-direct by Mr. Hill:

Q. Q. 45. When Mr. Jacobs took your affidavit last winter, did he ask you about anything except the time when your father moved away from Miller's mill?

A. No, sir.

Q. Q. 46. When you were in Mr. Jacobs' office this morning, did you speak about the machine that Mr. Drawbaugh showed you at White Hill station before Mr. Jacobs brought in the talking-machines for you to look at?

A. Yes, sir.

Q. Q. 47. When Mr. Jacobs then brought in the talking-machines for you to look at, were you able to positively identify any one of them as the machine that Mr. Drawbaugh showed you at White Hill?

A. There was one there, I remember, that looked like the one I saw, but I couldn't say positively that it was the same one.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 21st day of July, 1881.
FRED. M. OTT,
Examiner.

WILSON N. MILLER.

Recess for dinner until 2, P. M.

4.30, P. M.

Examination resumed pursuant to adjournment.

Present, same counsel.

WILLIAM L. GORGAS, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

I am thirty-three years of age; residence in Harrisburg, Pa.; I am a

Bank clerk. I know Daniel Drawbaugh, of Eberly's Mills, and have known him ever since I was a boy.

Q. 1. Are you a book-keeper in one of the Banks here in Harrisburg?

A. Yes, sir.

Q. 2. Were you formerly connected with the Drawbaugh Manufacturing Company, that was at once time manufacturing faucets and pumps at Eberly's Mills?

A. I was.

Q. 3. How many full members were there in that company originally?

A. There were nine.

Q. 4. How many full members were there in the Pump Company, that immediately preceded the Drawbaugh Manufacturing Company?

A. There were six.

Q. 5. Explain how the membership came to be increased to nine, and the name of the company changed.

A. The Pump Company took in Messrs. A. H. Gardner, Joseph Hursh, and myself, as the owners of Drawbaugh's patent for the faucet, and the company was then merged into the Drawbaugh Manufacturing Company.

Q. 6. Do you mean that the three persons owning the faucet patent assigned their patent to the Pump Company, and became members of said company, and that the concern thus consolidated together was thereafter known as the "Drawbaugh Manufacturing Company?"

A. Yes, sir.

Q. 7. Up to what time did that company continue to manufacture and sell faucets and pumps?

A. I think up to the time of the sale to Hauck Brothers & Co.

Q. 8. When did you cease to be a member of that company?

A. After I left the shop, which was in September, 1869, I took very little interest in the affairs of the company, and my father, some time after that,—I am unable to fix the date,—assumed my interest.

Q. 9. Have you here the account-books of that concern, including the day-book or day-books, and ledgers?

A. Yes, sir.

Q. 10. Will you please make and put in evidence a copy from the day-book, and also a copy from the ledgers, of all the charges in favor of and against Daniel Drawbaugh, continued on those books, or any of them, from the time when the Pump Company was started, in 1867, to the time when its affairs were finally settled and closed up in 1876?

A. Yes, sir; here they are.

[*Examiner marks the copies respectively,* "*Exhibit Gorgas, No.* 1," *and* "*Exhibit Gorgas, No.* 2."]

Q. 11. Have you here present with you the original minute-book of the company?

A. Yes, sir.

Q. 12. Please examine said minute-book with reference to an entry that I find therein, setting forth the proceedings of a meeting of the Drawbaugh Manufacturing Company on the first of May, 1876, and signed "M. B. Mosser, secretary and treasurer," and state whether you knew Dr. M. B. Mosser.

A. I knew him; he is now dead.

Q. 13. Were you acquainted with his handwriting?

A. I am.

Q. 14. Please examine the minute of the meeting of May 1st, 1876, referred to in my twelfth question, and state whether it is in his handwriting or not.

A. It is.

[*Mr. Hill requests the examiner to copy the minute upon the record, and put it in evidence as* "*Exhibit Gorgas, No.* 3."]

Q. 15. Have you examined the day-book, minute-book, and ledgers of said company with reference to the profits and losses of said concern from the time when it began, early in 1867, till its winding up in May, 1876?

A. Yes, sir.

Q. 16. Was the concern financially successful, or otherwise?

A. It was not successful.

Q. 17. What do you find to have been the aggregate loss of each of the six full members who originally started the enterprise?

A. From my examination, I find it to be about fifteen hundred dollars.

Q. 18. Is that in addition to the amount that was originally paid for the pump patent?

A. Yes, sir.

Q. 19. Daniel Drawbaugh was one of the original six full members, was he not?

A. Yes, sir.

Q. 20. From an examination of the books, how much does it appear that Mr. Drawbaugh actually paid into the concern in cash, as assessments and installments, from the beginning of the business to its winding up?

A. The actual cash that he paid in was twelve hundred and ten dollars. The first seven items on the credit side of the first ledger account are the items that make up this amount.

Q. 21. What amount was Mr. Drawbaugh, as a full member of the company, called upon to pay, by way of assessments and installments, and interest thereon, as shown by said books, from the beginning of the operations in June, 1867, till the winding up of the business?

A. Twenty-one hundred and eighty-six $\frac{33}{100}$ dollars. The items are as follows:

1868.

Oct. 31. Installments charged as follows:

1867,	June 27,		$300.00
	July 22,		100.00
	Oct. 19,		250.00
	Dec. 17,		200.00
1868,	Jan. 3,		100.00
	April 16,		350.00
1869,	July 5,		125.00
1870,	April 1,		500.00
		interest,	30.00
1871,	March 1,		200.00
1873,	July 19,	interest,	31.33

All the installments, except the interest charge of July 19th, 1873, thirty-one dollars and thirty-three cents, were charged to each of the full members at the same time. The reason why the first six installments were all entered on October 31st, 1868, was because there had been a neglect to enter them upon the account-books prior to that time.

Q. 22. Upon examining the assessments called for from Mr. Drawbaugh, I find the amount two thousand one hundred and eighty-six dollars and thirty-three cents, while his cash payments on installments and assessments aggregate only one thousand two hundred and ten dollars, leaving a balance of nine hundred and seventy-six dollars and thirty-three cents due from him to the company by way of installments and assessments, which he did not pay in in cash. Will you state how that nine hundred and seventy-six dollars and thirty-three cents was paid in?

PHONE COMPANY,-1

A. It was paid in by labor which he did for the company, and by a payment in cash at the distribution July 19, 1873.

Adjourned until July 22d, at 10, A. M.

July 22d, 1881, 10, A. M.

Examination resumed pursuant to adjournment.

Present, same counsel.

Q. 23. Will you please examine the books and state what is the aggregate amount that Mr. Drawbaugh's labor came to, during the whole time that he was connected with the concern, so far as the books show, referring to the minute-book as well as the day-book and ledgers?

A. I find by a minute of July 25, 1870, that a settlement was made with Mr. Drawbaugh for services up to April 1st, 1870. Mr. Drawbaugh agreed to take $1,000 00, less $115 00, "for labor performed for the company since its organization, including all claims in full against the company up to April 1st, 1870." The day-book, however, shows an entry of July 25th, 1870, "D. Drawbaugh, by labor and material, to the amount of $1,000 00 less $130 00, as upon the minutes, being due him for all claims up to April 1st, 1870," making $870 00. The minutes of May 1st, 1876, show a final settlement with Mr. Drawbaugh for labor and all claims of $51 13 due him.

[*Mr. Storrow objects to the statement by the witness of the contents of the book, unless the entries themselves are put in evidence.*]

[*Mr. Hill replies that the contents of the account-books and the minutes of the meeting of May 1st,* 1876, *are already in evidence and he now requests the examiner to copy and file in evidence as "Exhibit Gorgas, No.* 4," *the minutes of the meeting of July 25th,* 1870, *referred to by the witness in his last answer. The witness says that the minute of the meeting last mentioned is signed by Dr. Mosser, already referred to, and is in his handwriting.*]

Q. 24. What I want to get at is the aggregate amount that Drawbaugh's labor came to, without regard to the off-sets or credits.

A. The minute of the meeting of July 25, 1870, shows that D. Drawbaugh presented a labor bill that was liquidated at one thousand dollars. But my recollection is that the bill he brought in at that time was a little more than that. I don't recollect how much more. This was talked over at the meeting. The deduction of one hundred and fifteen dollars from the one thousand dollars was the result of a compromise. I was not present at the meeting, but I knew at the time. The minutes of May 1st, 1876, show that Drawbaugh presented a bill for labor of four hundred and seventy dollars and eighty-seven cents, but two hundred and ninety-two dollars and twelve cents of that amount had been settled or paid in the settlement of July 25, 1870, leaving the difference between those two amounts, one hundred and seventy-eight dollars and seventy-five cents, for labor from April 1, 1870, up to May 1, 1876.

Q. 25. Why was the one hundred and fifteen dollars deducted by compromise, July 25, 1870?

A. The company thought they were paying Mr. Drawbaugh enough, and thereby secured this compromise.

Q. 26. Then the eight hundred and eighty-five dollars allowed to him for labor, July 25, 1870, and the one hundred and seventy-eight dollars and seventy-five cents allowed to him for labor, May 1, 1876, amounting in the aggregate to ten hundred and sixty-three dollars and seventy-five cents, represents, if I understand you correctly, all the labor that Mr. Drawbaugh performed for the company, and for which he was allowed pay, from the beginning of its operations in June, 1867, to the end of its operations in May, 1876. Am I correct?

A. Yes, sir.

Q. 27. Having now gotten at the amount of labor that Mr. Drawbaugh performed for the company, I desire to ascertain how much was actually paid Mr. Drawbaugh on account of such labor, outside of the charges for assessments and installments, and outside of the amount that was apportioned to him from the sale to the Haucks, and outside of the fifty-one dollars and thirteen cents that was paid him on the settlement of May 1st, 1876.

A. The only payments he received during that whole time were as follows, some being cash actually paid him by the company, and other things equivalent to cash, such as money belonging to the company, which he collected and retained, and pumps, &c., for sale, and sundry small articles for his individual use:

1867,	Dec.	11,	To 2 pumps,	$115.00
1868,	Feb.	4,	" work done in the shop,	1.00
	Mar.	27,	" one file, for his use,	40
	May	15,	" one faucet,	3.50
	June	25,	" fixing reaper, Smith,	1.20
	Nov.	19,	" money received from Fisher & Son,	5.90
	Dec.	10,	" 3 hours lathe work,	1.20

1869,	Jan.	29,	"	1 file and 1 tram, for H. Snell,	$10.80
	Feb.	22,	"	1 red staff for tram, furnished to Michael Hurst,	2.00
	"	23,	"	1 file,	.75
	Mch.	16,	"	15 hours work on nail-feeder,	6.00
	"	20,	"	1 file,	.80

Those are all the items that enter into the account on the ledger. The aggregate is two hundred and forty-one dollars and eighty-five cents.

Q. 28. Please state separately the aggregate for each year, from 1867 to 1871, inclusive.

A. The aggregate for 1867 is one hundred and fifteen dollars; for 1868, thirteen dollars and twenty cents; for 1869, thirty-seven dollars and thirty-nine cents; for 1870, thirteen dollars and sixty-eight cents; for 1871, sixty-two dollars and fifty-eight cents.

Q. 29. Were there any dividends of profits paid to any of the members at any time or any dividend of profits declared by the company?

A. No, sir; my recollection is very vivid about that.

Q. 30. When, and for what sum of money, did the company sell out to the Haucks?

A. The day-book shows an entry of July 15, 1873, "By cash from Hauck Brothers & Co. for factory, machinery, tools, &c., seven thousand."

Q. 31. What was done with that seven thousand?

A. After paying off the debts, a distribution was made, each full member receiving six hundred and fifty dollars.

Q. 32. Did Daniel Drawbaugh receive six hundred and fifty dollars, or any part thereof, and if either, how much and when?

A. He received the difference between the charge and the credit of that date, July 19, 1873. The meeting for distribution was held July 19th. The balance he received was four hundred and twenty-five dollars.

Q. 33. Do you understand, then, that the three sums of two hundred and forty-one dollars and eighty-five cents, representing the aggregate moneys paid to Drawbaugh from 1867 to 1871, inclusive, the four hundred and twenty-five dollars paid to him at the distribution, July 19, 1873, and the fifty-one dollars and thirteen cents paid to him May 1, 1876, at the final settlement, are all the cash moneys that were actually paid by the company to Mr. Drawbaugh, from the beginning to the end of its business, the rest being charged up against his dues for assessments and installments?

A. Yes, sir.

Q. 34. When the five parties who, with Mr. Drawbaugh, originally formed the Pump Company in the early part of 1867 purchased five-sixths of Mr. Drawbaugh's pump patent for the consideration of five thousand dollars, do you know whether they paid him that amount in cash, or did they pay him partly in cash and partly in notes?

A. I do not know how he was paid.

[*Examination of Mr. Gorgas suspended until* 4, P. M.]

Adjourned for dinner, until 2, P. M.

2, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Examination of Mr. Gorgas continued by Mr. Hill:

Q. 35. In my twenty-sixth question, I assumed that the company allowed Mr. Drawbaugh, on account of labor, &c., at the settlement of July 25, 1870, one thousand dollars less one hundred and fifteen dollars, as stated in the minutes. When the transaction was actually entered up on the account-books, was he credited with so large a sum as eight hundred and eighty-five dollars on that account, or not?

EPHONE COMPANY,-1

A. The cash account in the ledger contains an entry under date of July 25, 1870, "wages paid Drawbaugh, $885.00," and the same cash account, on the same day, contains an entry of eight hundred and eighty-five dollars, received from him. The day-book of the date of July 25, 1870, contains no cash item relating to that transaction, but credits Drawbaugh eight hundred and seventy dollars "by labor and material to the amount of $1000 00 less $130 00, as upon the minutes." It, also, under the same date, contains an entry charging eight hundred and seventy dollars to the account "expense of labor." The account in the ledger, under Drawbaugh's name, contains no cash items relating to that transaction, but credits Drawbaugh with eight hundred and seventy dollars "by labor, etc." I am not able to explain the difference between these books. There seems to be an erasure in Drawbaugh's account in the day-book and in the ledger, in this same item. All the entries of this item are in Dr. Mosser's handwriting, and the erasures in this item are filled up in his handwriting. They all relate to the same transaction. This amount, whatever the sum was, was not actually paid to him in cash at the time, but was retained by the company against installments, as I have already testified substantially.

Cross-examined by Mr. Storrow :

Cross-Q. 36. As I understand the history of the enterprise to which these books relate, six persons, of whom Drawbaugh was one, bought of him his patent-right on pumps at the price of six thousand dollars, towards which the other five contributed five thousand dollars and he contributed one thousand dollars, so that he was to receive for his patent-right five thousand dollars and one-sixth interest; is that the case?

A. I was not a member of the original Drawbaugh Pump Company, but, as I understood, the form of the question covers the transaction.

Cross-Q. 37. That purchase, and the payment therefor, is not entered at all in the boooks which you have produced, is it?

A. No, sir; I consider it a matter apart from the organization of this Drawbaugh Pump Company.

Cross-Q. 38. I understand also that three persons had acquired from Drawbaugh the right to make measuring faucets under his patent, and that those three consolidated with the previous six into one concern, which was known as the Drawbaugh Manufacturing Company. Is that correct?

A. Yes, sir.

Cross-Q. 38½. These account-books, which you have produced, contain the accounts of the business carried on by the Pump Company, composed of the six persons, and the accounts of the business carried on by Drawbaugh Manufacturing Company, composed of the nine persons, but do not contain the accounts of the three who had the faucet patent-rights before consolidation. Is that so?

A. It is. I will add, that accounts of the Pump Company and the Drawbaugh Manufacturing Company are not separated, but are run right along in a continuous account.

Cross-Q. 39. Your father, William R. Gorgas, was one of the six and you were one of the three, were you not?

A. Yes, sir.

Cross-Q. 40. What part did you take in the business, or in the management of the affairs of these companies?

A. In the management of the affairs, I took the time of the men employed, and assisted my father in the keeping of the books. I also learned the trade.

Cross-Q. 41. The company did some work besides faucets and pumps, didn't it?

A. Yes, sir; we carried on a general manufacturing business.

Cross-Q. 42. Any machine shop jobbing business?

A. Yes, sir.

Cross-Q. 43. How many hands were employed at the shop from time to time?

A. The most we had employed at any time, as near as I can recollect, were eight.

Cross-Q. 44. Did any of the Drawbaugh family, besides Daniel, work there?

A. Yes, sir; his brother, J. B. Drawbaugh, and his nephew, Harman K. Drawbaugh, were employed while I was in the employ of the company.

Cross-Q. 45. Harman Drawbaugh worked there from the spring of 1868 to the spring of 1869 pretty much all the time, didn't he?

A. Yes, sir.

Cross-Q. 46. And John Drawbaugh worked there steadily through the same year, didn't he?

A. Yes, sir.

Cross-Q. 47. They both of them worked there some in 1870, didn't they?

A. Yes, sir.

Cross-Q. 48. Did a man by the name of E. B. Hoffman work there some time in 1868? If so, how long? Please look at the books.

A. I know that he did. The first payment of wages to E. Hoffman is under date of April 4, 1868, "as wages on account of March." The next payment to him is under date of May 6, 1868, about a full month's wages, undoubtedly on account of April, and those are the only payments to him.

Cross-Q. 49. Who were the six first members?

A. William R. Gorgas, Henry S. Rupp, Samuel M. Hertzler, John M. Hursh, John Sheeley, and Daniel Drawbaugh.

Cross-Q. 50. Who were the three?

A. A. H. Gardner, Joseph Hursh, and myself.

Cross-Q. 51. I notice in the day-book there seem to be entries of a good many faucets returned to the company. Was that one of the causes that led to the absence of dividends?

A. It was.

Cross-Q. 52. I notice at the end of the second day-book, under date of July 20, 1876, the small distribution of cash by the company, in which Drawbaugh received twenty dollars. I suppose that was paid as stated in the book, was it not?

A. Yes, sir; it was the final distribution of money in the hands of the treasurer.

Cross-Q. 53. I observe in the day-book in 1868, that the company did some drafting for the Mill Bush Company, and that they had Daniel Drawbaugh do it, and charged five dollars a day for his time. Did he have sufficient skill to work as a mechanical draftsman?

A. Yes, sir.

Cross-Q. 54. I see a good many charges for getting up patterns for the Mill Bush Company. Were you getting up a set of patterns and machinery for them?

A. Yes, sir.

Cross-Q. 55. In your ledger I notice, on page ninety, quite a long account, headed "Trams." Did your company make and sell Drawbaugh's patent tram?

A. Yes, sir.

Cross-Q. 56. Will you please look at that account and tell me whether you ever sold any trams to the firm of Zacharias & Son, and if so, give me the date of all your sales to them?

A. I find on March 17, 1869, Zacharias & Son were charged with one tram, twenty dollars.

Cross-Q. 57. When was that tram paid for?

A. There appears a credit on April 16, 1869, of Zacharias & Son for tram, on account, twenty dollars.

Cross-Q. 58. Do you find any other tram sold to them or charged to them or paid for by them?

A. No, sir.

Cross-Q. 59. Why was Drawbaugh asked to give up or deduct the one hundred and fifteen dollars in 1870?

A. I was not present at the meeting of the company, at the time of that settlement, but there was a feeling among the members of the company that Drawbaugh had been well paid for his patent-right, and they were disposed to make the best possible terms of settlement with him.

Cross-Q. 60. What was the price paid him for the faucet right which the three owned?

A. I do not know. I procured my interest from Mr. Gardner.

Cross-Q. 61. Do you mean that you bought part of Mr. Gardner's interest?

A. Yes, sir.

Cross-Q. 62. Mr. Gardner did some active work for the Drawbaugh Manufacturing Company, didn't he?

A. The books show, under date of July 25, 1870, "expenses to A. H. Gardner, for hauling &c. for company as per bill, $76 96."

Re-direct by Mr. Hill:

Q. Q. 63. Do you know whether Mr. Hursh bought his interest in the faucet from Mr. Gardner, or not?

A. I am not positive, but I think he did.

Q. Q. 64. What was the trouble or defect that caused faucets to be returned?

A. Some were imperfectly made, some became rusty inside and would not work easily, but the principal cause was that they were imperfect in construction.

Q. Q. 65. They were measuring faucets, were they not?

A. Yes, sir.

Q. Q. 66. Were they good faucets when properly constructed?

A. Yes, sir.

Q. Q. 67. Did Drawbaugh turn in his mill-tram and staff invention for the benefit of the company?

A. Yes, sir.

Re-cross by Mr. Storrow:

Re-cross-Q. 68. By your last answer, I suppose you mean that he allowed that company to make and sell those articles while they were doing business, and not that he actually assigned those patents to them forever as their own property, don't you?

A. There is a minute about that that will explain the thing—I find that I was mistaken in my answer to the sixty-seventh question. The minute of August 28, 1868, reads as follows:

"It was proposed to manufacture trams. D. Drawbaugh agreed to take two dollars per tram for his share of patent right, and William R. Gorgas to see Mr. C. Eberly, to ascertain whether he agreed to take the same. On motion of William R. Gorgas and S. M. Hertzler, it was agreed to make stave-jointers."

Re-cross-Q. 69. Please to hand to the examiner, to be made part of the record, one of the printed bill-heads of the company.

A. Here it is.

Drawbaugh Manuf'g Comp'y,
Box 46, Shiremanstown, Pa.,
MANUFACTURERS OF
Drawbaugh's Rotary
POWER PUMP,
for Mining and Factory use, etc
Drawbaugh's Self-Measuring Faucet,

Re-re-direct by Mr. Hill:

Q. Q. Q. 70. When do the minutes show that you, Mr. Gardner, and Mr. Hursh united with the other six members in the business?

A. The minutes of October 7th, 1867.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 22d day of July, 1881.

FRED. M. OTT,
Examiner.

WM. L. GORGAS.

E. B. HOFFMAN *recalled.*

Examined by Mr. Hill:

Q. 1. In your deposition given June 1st, 1881, you stated that in the latter part of the summer of 1873 you were fishing on Yellowbreeches creek, and while there were at Mr. Drawbaugh's shop, and saw the machine marked "I," and that before that time you had seen the machine marked "C," but that when you saw the latter machine it contained a large horse-shoe magnet that extended out about two inches beyond the base-board, &c. Will you now look at the machine on the table before you, marked "C reproduced," and state how it compares with the machine "C," as you saw the latter prior to the fishing excursion of 1873?

A. That is as near the machine as I can tell—looks as near like the one that I saw there.

Q. 2. Do you recollect whether or not, when you saw that machine prior to the said fishing excursion, it contained an electro-magnet arranged in the same position as this one on "C reproduced?"

A. It had. I think the coils were a little larger, though.

Q. 3. When Mr. Drawbaugh first showed you the machine referred to, was the horse-shoe magnet in the position in which it now is on "C reproduced," or not?

A. It was not. It was laying on the bench, and he placed it in position—something like that position there. [Pointing to horse-shoe magnet on "C reproduced."]

[*Examiner certifies that the position of the magnet referred to is nearly horizontal, with the poles in contact with the cores of the electro-magnet.*]

Q. 4. How does the horse-shoe magnet on "C reproduced" compare with the horse-shoe magnet that Mr. Drawbaugh placed on the machine you refer to?

A. It is about the same in size, only there was another piece of steel to it—four pieces instead of three.

Cross-examined by Mr. Storrow:

Cross-Q. 5. Did you ever go to Drawbaugh's shop after the fishing excursion you have spoken of?

A. I was there several seasons, 1873, 1874—1877 was the last time I was over, I think.

Examination taken, reduced to writing, and by the witness subscribed to before me, this 22d day of July, 1881, he having been affirmed upon his previous examination.

FRED. M. OTT,
Examiner.

E. B. HOFFMAN.

Adjourned until Monday, July 25th, at 10, A. M.

Monday, July 25th, 10, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

AMOS FROWNFELDTER, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

I am forty-six years old; I live in Fairview township, York county; I am farming now.

Q. 1. Do you know when the old saw-mill that used to stand close by Daniel Drawbaugh's shop, at Milltown, Cumberland co., Pa., was torn down and hauled away?

A. In 1874, about the first of September, as near as I can recollect.

Q. 2. Who hauled the stuff away when the mill was torn down?

A. I hauled it away myself.

Q. 3. Was that old mill in a dilapidated condition for some time before it was torn down?

A. Yes, sir; the foundation was in great part washed away.

Cross-examination waived by Mr. Storrow.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 25th day of July, 1881.

FRED. M. OTT,
Examiner.

his
AMOS ⋈ FROWNFELDTER.
mark.

MICHAEL M. GROVE, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

I am fifty-two years old; reside in Harrisburg, Pa.; I am superintendent of the Harrisburg stock-yards. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland co., Pa., and have known him since I went into partnership with Bear, Kline & Moore.

Q. 1. Have you any recollection of seeing Mr. Drawbaugh's talking-machines, and hearing him speak of them, about the time you were becoming connected, or during the time you were connected, with the Axle Company?

A. Yes, sir; he showed me an arrangement—I don't know what you might call it—a box arrangement, that he had there. He said, if he would talk into it, you could hear him at Pittsburgh. He went on to explain it to me. I didn't take much stock in it, nor pay much attention to it. The remark that you could hear it to Pittsburgh is about the only thing that I recollect of.

Q. 2. I suppose your interest was mainly on the Axle Company's business, was it?

A. Yes, sir.

Q. 3. About what time was it that he showed you that instrument, and had that conversation about it?

A. It was shortly after we went into business together. I think it was the first time I went over there after we had signed the articles of agreement here.

Q. 4. Do you mean the articles of agreement of co-partnership, dated December 23d, 1874?

A. Yes, sir.

Q. 5. Please look at machines "A" and "D," now shown you, and state whether you have any recollection of having seen them at Mr. Drawbaugh's shop about the time you have referred to.

[*Objected to as leading.*]

[*Question withdrawn and the following substituted.*]

Q. 6. Please look at the instruments "A" and "D," now shown you, and state whether you have any recollection of them, and if so, when and where you first saw them.

A. They look to me as if they are the ones that Drawbaugh showed to me at the time he made the remark, above referred to, that he could be heard to Pittsburgh.

Q. 7. It has appeared in evidence here that the axle firm was dissolved about the last of February, 1876. That Mr. Bear and Mr. Kline went out of the concern at that time, and that you and Mr. Moore went along with the business for a while, Mr. Bear chiefly attending to it, having some little repairing work done on reapers and mowers in the summer of 1876, and that in November, 1876, all the property was turned over to Captain Moore, who assumed the debts. Does your recollection agree with this, or not?

A. Yes, sir.

Q. 8. After Mr. Bear and Mr. Kline went out, about the last of February, 1876, did you pay much further attention to the business, or not?

A. No, sir.

Q. 9. Who did chiefly manage the business after that time?

A. Captain Moore.

Q. 10. After Mr. Kline and Mr. Bear went out, did you go over to the shop again, or not, so far as you remember?

A. I haven't any recollection of going over after that.

Q. 11. Where did you reside while that business was going on?

A. When I first went into it, I was keeping the hotel at the stock-yards in Dauphin county, just above Harrisburg. Then I moved from there down to Harrisburg.

Q. 12. Have you, or not, any recollection of a man named Samuel C. Crawford being in the employ of Mr. Bear and Mr. Kline before you went in with them in December, 1874?

A. Yes, sir.

Q. 13. Was it in cold or warm weather when Mr. Drawbaugh first showed you his talking-machines?

A. It was in cold weather.

Q. 14. Was it during the first winter that you were connected with the axle business?

A. Yes, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 15. Please tell me anything else you remember about Drawbaugh's talking-machines.

A. I don't remember anything at all about it, except that one remark he made, as I have said.

Cross-Q. 16. Didn't you ever see any talking-machines there, except once?

A. I don't remember.

Cross-Q. 17. Do you feel quite sure that you have never been at Drawbaugh's shop since February, 1876?

A. I don't recollect the dates when I was there.

Cross-Q. 18. How long have you known Drawbaugh?

A. I got acquainted with him about the time, or shortly before, I bought an interest in Kline's patent axle.

Cross-Q. 19. Did you keep the White Hall Hotel here at one time?

A. Yes, sir.

Cross-Q. 20. When?

A. I moved there the first day of April—I don't remember the exact year. I think it was in 1875.

Cross-Q. 21. How long did you keep that hotel?

A. Two years.

Cross-Q. 22. Cumberland county people generally went to that hotel, didn't they?

A. Yes, sir; most of them stopped there.

Cross-Q. 23. Where did you go to after you stopped keeping that hotel?

A. I moved to Fifth street, Harrisburg.

Cross-Q. 24. What was the last place you lived at before you began to keep the White Hall Hotel?

A. I lived in Fenn's house, Walnut street, Harrisburg.

Cross-Q. 25. How long did you live in Fenn's house?

A. I moved there in May, and left there in April.

Cross-Q. 26. Where did you last live before you moved there?

A. I moved from the stock-yards to Walnut street.

EPHONE COMPANY,-1

Re-direct by Mr. Hill:

Q. Q. 27. It must have been in April, 1876, then, that you began to keep the White Hall Hotel?

A. I couldn't tell without looking at my books. I don't know how long I lived in Fifth street. I can't remember the dates. I didn't keep any account of the dates in my mind.

Re-cross by Mr. Storrow:

Re-cross-Q. 28. Do you live in Fifth street now?

A. Yes, sir.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 25th day of July, 1881.

FRED. M. OTT,
Examiner.

M. M. GROVE.

GEORGE L. HALE, *being recalled, and affirmed, saith:*

Examined by Mr. Hill:

Q. 1. In your former deposition in this case, you testified that in the fall of 1873, Daniel Drawbaugh, at his shop at Milltown, showed you the machine "C," but that the machine was not in the same condition as now. Please look at the machine marked "C reproduced," and state how that compares with the machine that Mr. Drawbaugh showed you in the fall of 1873.

A. That is like it. He had a magnet on, like that horse-shoe magnet on "C reproduced," as near as I can tell. I don't know whether it was exactly the length and width of that; it was on a platform. The magnet was about six inches long and about three inches wide, as near as I could tell.

Q. 2. Please look at the two spools wound with wire, that lie between the poles of the horse-shoe magnet and the armature attached to the diaphragm, and state whether the machine did or did not have such spools on it at the time that you saw it in the fall of 1873.

A. It had something of that kind on, but it was copper wire, covered with green, and the wire, I think, was heavier than that, too.

Q. 3. Was it arranged between the poles of the horse-shoe magnet and the diaphragm?

A. Yes, sir; but how it was fastened there I couldn't remember.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 25th day of July, 1881.

July 25th, 1881, 3.30, P. M.

Examination resumed pursuant to adjournment.

Present, same counsel.

[*By consent of counsel for complainants and respondents, further taking of respondents' testimony is adjourned, to be resumed hereafter upon one week's notice to complainants' counsel, formal notice being waived. It is also agreed by counsel that respondents' time for closing testimony be extended to the* 15*th day of October*, 1881.]

November 14*th*, 1881.

Examination resumed by agreement of counsel.

Present, Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

HENRY HERR, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is fifty-three; residence, Harrisburg, Dauphin county, Pennsylvania; occupation, farming. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna., and have known him since about the year 1869.

Q. 1. How happened you to become acquainted with him in the year 1869?

A. I was inquiring for a man who understood putting in a ram, which I desired for raising water to my barn-yard, and I was directed to him as a proper person for that purpose.

Q. 2. While you were talking with him about the ram, did he ever say anything to you about a talking-machine?

A. He drawed my attention to a machine there that he called a talking-machine, but I can't say that it was at the first time that I was there. I was there often, and at one of those times he called my attention to it—at different times.

Q. 3. Were you ever there after Wilson Bear and Jacob Kline commenced to manufacture axles at Drawbaugh's shop?

A. Not that I can recollect. I never met them there that I can recollect. He was always alone when I saw him.

Q. 4. Were you ever there after the Haucks bought out the faucet business and commenced to make faucets there at Drawbaugh's shop?

A. I don't recollect anything of the Haucks being there. I know

Mr. Hauck, of Mechanicsburg, but I never saw him there, to the best of my recollection

Q. 5. How soon after you first began to talk to Mr. Drawbaugh in 1869 about the ram was it that he began to talk to you about, and show you, the talking-machine?

A. That I can't tell, how soon after the first time. We were speaking about an injector that he said he had invented, but that some parties had got ahead of him, and that now he had invented something that would take the place of the telegraph, or would be used for the telegraph; that is the way the conversation started.

Q. 6. How long was it after the first time that you were there?

A. It was during that year, to the best of my recollection. I have no record of any kind.

Q. 7. How did the talking-machine that he showed you look?

A. It was quite a small affair, and there was a wire or cord that ran out of the building, and then there was a wire that ran down. He took me down into the cellar and showed me where the wire ran into the ground, but how it was fixed or fastened I do not know.

Q. 8. Did he talk into the machine in your presence or hearing?

A. I think he did, but I urged him to stop that and go to my work, as I was not interested in anything of that kind. I was anxious to get home.

Q. 9. Do you recollect of listening at the machine to see whether you could hear what was said through it?

A. I think he spoke through the machine. I don't recollect that I did. He walked up to it and talked into it to let me see how it was done. I don't recollect that I listened to it; I was anxious to get away.

Q. 10. How often did he speak to you about that invention?

A. To the best of my recollection, he drawed my attention to it every time I came there after the first time he showed it to me. His object was to secure his invention by getting a caveat, or some such thing he called it, and he wanted money to get it. He was a stranger to me.

Q. 11. What did he say about his money matters, and about his wanting to get money to protect his invention?

A. He said he was a poor man and he couldn't raise the means, and if I would help him, or procure any person to assist him, he would give me a half interest.

Q. 12. What sort of a looking instrument was it that he talked into?

LEPHONE COMPANY,-2

A. It was a kind of a round block—greasy from working at it with greasy hands—and it was partly tin, and, I think, partly glass.

Q. 13. Please look at the instruments "B" and "F," which I now show you, and state whether it bore any resemblance to these instruments, or whether it was different.

A. This here "B," or something very much like this, was among the lot. He only had it very temporary—just got up. I can't say whether "F" was there or not. There was a glass part there, but I can't say whether it was this or not.

Q. 14. Do you recollect whether the wires that you saw down in the cellar were drawn tight, or were they loose and hanging slack?

A. To the best of my recollection, they were slack; they were not tight.

Q. 15. Were there any wires attached to the instrument and running out of the building?

A. There was one, and I thought it ran up to a house, but I didn't see where it ran to, except that it ran out of the building.

Q. 16. Have you any recollection of seeing this instrument "C" there?

A. Towards the latter part of my calls there I saw something like this. Perhaps a couple of years after, when he had what he called improvements. Then he had something like this, and he had a kind of a steel with it, the shape of a V, I think—or horse-shoe.

Q. 17. Please look at this instrument "C reproduced," and tell us how this compares with the instrument you have referred to.

A. It was something like this, only it looked older, as if it had been used more than this. He had it standing on a table with his other fixtures. I don't know that he used it while I was there; he had other speaking-machine fixtures.

Q. 18. Who was running the Eberly's mills the last time you were out there and saw the speaking-machines?

A. The man's name was Methusalem or some such name—from Carlisle. He had it after Eberly. The name Beetem is suggested to me now, and, I think, that is the name.

Q. 19. What were you out there for at these different visits?

A. I was there after repairs to my ram.

Q. 20. What did he call the machine that he showed you?

A. A talking-machine or speaking-machine, to the best of my recollection. It was to take the place of the telegraph.

Cross-examined by Mr. Storrow:

Cross-Q. 21. Who directed you to go to Drawbaugh about a ram?

A. Some of his neighbors had told me about his putting up rams. I think it was Harry Neidig, a cousin of mine. I think he had put one in for him.

Cross-Q. 22. Did you go and look at one before you bought?

A. Not that I can recollect. I went to see him to come over and see whether I had a sufficient supply of water to run a ram before ever I contracted for one, or fall enough for the purpose.

Cross-Q. 23. Did he come over and look at your place?

A. He came over on a Saturday morning, and this neighbor of his, who was mentioned a bit ago, brought him over.

Cross Q. 24. Did you contract with him to put up a ram for you?

A. Yes, sir.

Cross-Q. 25. What price did you pay him?

A. It was between sixty-five and sixty-eight dollars, as near as I can recollect. He furnished the pipe and the ram, and connected them all complete in running order.

Cross-Q. 26. Did he have the ram all made when you went to his shop, or did he make it for you?

A. I think he made it for me. He had none finished when I went there.

Cross-Q. 27. How long did you keep it?

A. I think I had it till 1874 or 1875, as near as I can recollect.

Cross-Q. 28. You speak of going to his shop to get it repaired. Did it get out of order often?

A. I had a good deal of trouble with the air-chamber, as he called it. Not understanding it myself, it gave me a good bit of trouble to get it to work right.

Cross-Q. 29. How many times do you think you went to his shop about it?

A. I was back and forward pretty often the first few years, I couldn't give the number of times. I think I had a new drive pipe, and then he killed time, as I thought, with this talking-machine. When anything would come into his mind about it, he would let everything go and leave my work. He would drop my work while I was there, and he disappointed me several times that I had to go back again. He said he worked day and night at this other machine.

Cross-Q. 30. Do you mean to say that he gave you as an excuse

LEPHONE COMPANY,-2

for not finishing your work that he worked day and night at his talking-machine?

A. That is what I understood him to say; that he worked day and night, and whenever he had nothing on hand that was too urgent upon him; and I know that he dropped my work to work upon it.

Cross-Q. 31. Did he ever tell you that more than once?

A. I think he did.

Cross-Q. 32. Did you pay him for this work of yours that you think he dropped?

A. I always paid him as soon as he had the job that he was working at finished. I paid him for the ram as soon as he had it connected and the water ran up; and so I paid him for the other jobs, too, as soon as he had them finished.

Cross-Q. 33. How much money did you lay out repairing that ram?

A. I think I got a new ram once. I think he took the ram back and gave me a new one; and then I had threads cut and other things done. I think I have the account yet of putting the ram in; but the other things I just paid him as he had them done.

Cross-Q. 34. What made you take it out finally?

A. A man by the name of Tunis, a plumber in town here, said he had an improved ram, and if there was anything wrong with it, I would not have so far to go to have it repaired and looked after.

Cross-Q. 35. Who did you ever see at work in Drawbaugh's shop when you went there?

A. He was generally at work by himself; he had a helper sometimes. There might have been at work in a different part of the shop, that I did not see. I used to sometimes come when he was not there himself. I used to get my feed at the mill there and stop at the shop.

Cross-Q. 36. What part of the shop did you see him in?

A. What he called the upper shop. I think there was a shop in the lower part, but the upper part is where I generally found him, and where he had his tools and machines

Cross-Q. 37. How did you get into the upper part of the shop—where were the stairs?

A. I think it went in even to the lower shop and that you went up-stairs to the upper shop. I have not been there for several years.

Cross-Q. 38. By going in even, do you mean going in without any steps at all—only a threshold?

A. I don't recollect, but it appears to me there was a step or so down to the lower shop. We went down-stairs on the inside when he showed me the wire running into the ground. There might have been steps on the outside running up to the upper shop, and a step or so down into the lower shop from the outside.

Cross-Q. 39. Then, do I understand you to mean that what you call the lower shop was on the level of the ground outside, or perhaps a step below it?

A. I think that is as near as I can recollect it. It was very seldom I got into the lower part. It is four or five years ago, I think, since I have been there.

Cross-Q. 40. And what you call the upper shop was the floor above this lower shop, with a flight of stairs leading up to it from the lower shop, and, perhaps, some steps besides, outside, leading to it. Is that what you mean?

A. If I can recollect the place right, there was steps outside to the floor that he was working on. I can't say how many steps.

Cross-Q. 41. Was the floor that he was working on the one right over what you call the lower shop?

A. That I can't recollect—about the lower shop. I only recollect once being down in the lower shop, or room, or store-room, or whatever you call it.

Cross-Q. 42. How many flights of stairs did you go up to get to the shop where you commonly found him working?

A. That I can't recollect.

Re-direct by Mr. Hill:

Q. Q. 43. What business was Mr. Drawbaugh working at when you used to go there?

A. I think he called them faucets. Something for measuring molasses, to the best of my recollection—a measuring faucet; and then he did repairing for the neighbors and farmers on reaping-machines, threshing-machines, &c. It appears to me I saw those things there.

Q. Q. 44. Have you ever been there since the beginning of the "Centennial" at Philadelphia?

A. I don't think I have; I don't recollect that I was.

Q. Q. 45. Do you recollect who was concerned with Daniel Drawbaugh in the faucet business, when you used to go there?

A. I do not recollect whether he had a partner or not. I did not notice any one there, and I did not hear that there was any one. It

EPHONE COMPANY,-2

appears to me that when he gave me a receipt for my ram he gave me one in his own name.

Q. Q. 46. How long had your cousin had his ram before he told you about it, and you got yours?

A. I can't say positive that he had his ram before I got mine; but he told me first about the rams that were being put up through the neighborhood by Mr. Drawbaugh, and then I concluded that I would go to see him.

Q. Q. 47. Have you held any public office here in the county or city during the past few years?

A. I have been Director of the Poor of Dauphin county for three years.

Q. Q. 48. What years?

A. Along 1871, 1872, and 1873, I think.

Q. Q. 49. Was your information about Mr. Drawbaugh's talking-machine obtained before or after you first became Director of the Poor?

A. To the best of my recollection, it was before—shortly before—a year or so before.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 14th day of November, 1881.

FRED. M. OTT,
Examiner.

HENRY HERR.

Adjourned until the 15th of November, at 10, A. M.

November 15, 1881, 10 *o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present, same counsel.

JOHN WOLF, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

I am seventy-five years of age; reside at Camp Hill, Cumberland county; I used to farm, but do nothing now; I am getting too old to farm now. I know Daniel Drawbaugh, of Eberly's Mills, and have known him upwards of thirty-five years; I have lived about forty-five years in that neighborhood.

Q. 1. Did you do any work for the firm of M. M. Grove & Co., consisting of Grove, Kline, Moore, and Bear, about the time when they commenced operations in the business of manufacturing axles, &c., in Drawbaugh's shop at Milltown? If so, what work did you do for them?

A. I was hauling the lathes, and the first I hauled was a load of coal. I did all the hauling that they needed at that time. I have it here in black and white.

Q. 2. Did you make a book entry or written memorandum at that time showing the work you did for them, and the dates at which it was done?

A. Yes, sir.

Q. 3. If you have it here, will you hand it to the examiner, and point out to him the entries relating to that work, in order that he may make a copy of them upon the record of this case?

A. Yes, sir; here they are.

On February	20, 1875, one load of coal,	$ .50
March	8, three lathes from Harrisburg,	4.00
do	26, box of axles and coal, Milltown,	1.25
do	27, one grindstone to Milltown,	1.00
do	28, one load of boards and plank,	1.50
do	31, one drill lathe,	1.25
April	13, to one load of brick from Harrisburg,	1.25
do	14, to one load of axles from Bridge to Milltown,	1.00
do	16, to one load of coal to Milltown,	.75
June	10, one load of axles to Milltown,	1.00
Feb.	25, to one load of axles to Milltown,	1.00

The above items were hauled on the order of Wilson Bear.

The following were hauled on the order of Captain Moore, to the same shop:

1875,	to box of axles to Milltown,	$2.50
13,		
Sept.,	barrel of oil to Milltown,	1.00

Q. 4. At the time when you hauled these first items in February and March, 1875, were they just getting their new machinery into the shop for the purpose of manufacturing axles there?

A. Yes, sir.

Q. 5. While you were hauling that new machinery in, in February and March, 1875, did you see anything of Daniel Drawbaugh about the shop?

A. Yes, sir.

Q. 6. Did you have any conversation with him during the months of February and March?

A. Yes, sir.

LEPHONE COMPANY,-2

Q. 7. In those conversations, was anything said about a talking-machine?

A. It was either the first or second load I brought there, I am not certain which, that I had to go into his room or shop where he has his instruments to work, to find him. He showed me a thing there. Says he: "I am working at a talking-machine here, and if I can get it accomplished, or had the means to get it accomplished, I would be a rich man."

Q. 8. Give his language, as near as you can, just as he said it.

A. He told me "if he could get this accomplished—get it patented—he would be one of the richest men." I think that is as near as I can explain it.

Q. 9. What did he say about means?

A. He said that he was a poor man; that he had not the means; that he had so much sickness in his family, that keeps him poor.

Q. 10. Did he show you the talking-machines, or any of them?

A. Yes, sir; he showed me some. I guess he would have showed me more, but I was in a hurry with the hauling. He was employed to help me in unloading, and I urged him on the best way I could.

Q. 11. What was he doing when you had to urge him on to help you?

A. Most of the time he was in his room at his talking-machine, working. Sometimes he was in the shop where the lathes were to be put in, ridding out that.

Q. 12. Did he talk to you through the machine?

A. No, sir.

Q. 13. Have you ever been in the shop since you finished your hauling there?

A. I was in once.

Q. 14. When was that?

A. I think it is this winter two years that I sold him a lot of potatoes, ten or twelve bushels, that I went down to him. He was in the shop then.

Q. 15. Did you have any talk with him about the talking-machine at that time?

A. No, sir.

Q. 16. At the time that you hauled the lathes, &c., to his shop, in 1875, did you talk with him about the talking-machines on more than one trip?

A. I talked several times with him about it.

Q. 17. Do you remember on which trips it was that you talked with him about it?

A. It was either on the first or second that we had the first conversation about it.

Q. 18. Can you fix the trips on which you had other conversations about it?

A. Yes, sir; what makes me certain is the time when I hauled the grindstone there.

Q. 19. What talk was there at the time when you hauled the grindstone there?

A. We had to get a new rope and put up pulleys, to hoist the grindstone, and while we were at work he went off—Daniel did. He went into his room, then, again, and after we were through, and ready to hoist, I went in and fetched him out. He came right out and helped to hoist, and there was nothing talked about his machine at that time. He was working at a wheel. I was in a hurry to get home. I think it was drizzling with rain.

Q. 20. When you went in to bring him out, did you see any of his talking-machines there, in his room, or not?

A. I did.

Q. 21. Please look at these machines, "B" and "F," which I now show you, and state whether you have, or have, not any recollection of seeing either of them there at his shop, at the time you were engaged in hauling the lathes and grindstone?

A. I don't mind of seeing that, "F," but it runs in my mind that I saw that, "B," lying on the bench.

Q. 22. Did you see anything there that looked like either of these two machines, "C" and "C reproduced," which I now show you?

A. Yes, sir, I saw this one ["C."] I picked it up and took it in my hand. Something pretty much like this [horse-shoe magnet of "C reproduced"] was lying on the bench.

Q. 23. Look at this machine "A," which I now show you, and state whether you saw that there, or anything like it, at that time when you were hauling the lathes or grindstone.

A. Yes, sir; I saw such a wheel, pretty much like this ["A"] at that time.

Q. 24. Answer the same question as to these two machines, "D" and "E."

A. I can't recollect of seeing these; they might have been there, but I don't recollect of seeing them. There was always so much lying on his bench that it was crowded all the time with one fixture and another.

Q. 25. Did you particularly examine or take much interest in his talking-machinery?

A. No, sir.

Q. 26. Did he tell you at that time whether he could talk through his machines, and if so, how far he could talk through them?

[*Objected to by Mr. Storrow as hearsay and incompetent.*]

A. Not as I can mind of.

Q. 27. Did he say anything about the telegraph in connection with the machine?

A. He told me at one time, but I don't recollect whether it was at the time of the hauling, or at a time when I was in, since the hauling—he told me that if he had it in operation right, once, he could talk across the ocean.

Q. 28. I understood you to say that you had no conversation with him about the talking-machine at the time when you were in there since the hauling. Do you now think that you may have had conversation with him about the talking-machine at that time?

A. I think it must have been at the time of the hauling.

[*Question objected to by Mr. Storrow as leading.*]

Cross-examined by Mr. Storrow:

Cross-Q. 29. How far from Mr. Drawbaugh do you live?

A. About two miles.

Cross-Q. 30. When you were at the shop, was he generally at work on his talking-machines?

A. The most of the time.

Cross-Q. 31. And do you mean that when he ought to have been helping you to unload, he would leave you and go off and work on his talking-machine?

A. Sometimes he would work on the talking-machine, and at other times he would work on the floor where we put the lathes down.

Cross-Q. 32. In the account, in your third answer, I see an item of February 25th, with no date of the year to it. What year was that?

A. I think that was in 1875.

Cross-Q. 33. How did you happen to get that entered separately from all the rest?

A. These were hauled up to the store at Camp Hill, and Kline ordered me to take them back. They were ordered wrong.

Cross-Q. 34. Whose store?

A. Kline kept it that time.

Cross-Q. 35. What else did you ever see in Drawbaugh's shop, besides talking-machines?

A. I saw some clocks standing there—these eight-day clocks—that people brought there to repair, still.

Cross-Q. 36. What else did you see?

A. He repaired reapers. He fixed them so they would not rattle so—took the motion off. He fixed one for my son, and several others that I know of.

Cross-Q. 37. What else did you ever see at his shop?

A. That is about all that I can recollect, except the faucet business, that he was engaged in. I never saw him working at them, but I saw them lying there—a whole host of them—when I brought the drills there.

Re-direct by Mr. Hill:

Q. *Q.* 38. When did you see the harvesters there for repairs?

A. I did not see them there, but my son told me that he had his there, and so did Hohler.

Examination taken, reduced to
writing, and by the witness affirmed
and subscribed to before me,
this 15th day of November, 1881.
FRED. M. OTT,
Examiner.

JOHN WOLF.

JOSEPH C. JEFFERIES, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is forty-four; residence, Steelton, Dauphin county, Pennsylvnnia; occupation, carpenter. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania, and have known him since the fall of 1876.

Q. 1. Under what circumstances did you become acquainted with him in the fall of 1876?

A. I met him at the election polls of Lower Allen township, Cumberland county. It was the general election of 1876, on the first Tuesday after the first Monday of November.

Q. 2. Did you have any conversation with him about talking-machines on that day?

A. There was a large party of us there together, and he was explaining about manufacturing a machine to talk with. His conversation was not directed to any one of us directly, but it was to the party, and he invited us all to visit his shop and have a look at it.

Q. 3. How do you fix the year as 1876?

A. That year I moved from Harrisburg to Lisburn, Lower Allen township. In the month of August, I attended a sale there and bought a property from William H. Gilmore. I then moved there in September.

Q. 4. Did you vote there at that election?

A. No, sir; I did not, but I went with a party to the polls. It is customary there for one of the men residing at Lisburn to hitch up a four-horse wagon, and haul all the voters from Lisburn to the polls. I think Mr. Barber hauled us that day.

Q. 5. Did you accept Mr. Drawbaugh's invitation to visit his shop and see his talking-machine?

A. Not on that day; but, as near as I can remember, it was on the following week that I paid the first visit to his shop. I was working at Harrisburg, for Theodore F. Boyer, at the Temperance hotel, repairing different places around the house, and on my way home I stopped into Mr. Drawbaugh's shop, and that is the first visit I ever paid there. I then saw some of the apparatus that he was working on.

Q. 6. State, as near as you can recollect, the conversation that took place there in the shop with him during that first visit.

A. I went in and passed up the stairs to his shop, and said: "Mr. Drawbaugh, as I was along your way, I thought I would stop in and see this great instrument you were speaking of, of talking." Said he: "I will show it to you in a few moments." He then went to one corner of the shop and showed me some of the things he had set up, and he described to me a wire he had running through the shop floor, and the connection he had below in the ground.

Q. 7. Did he talk to you through the machine?

A. Not to me. He went to the machine, and handled it, and spoke, and just gave me a general idea of the working of it.

Q. 8. Did he tell you how far he could talk through it, so as to be heard and understood?

[*Question objected to by Mr. Storrow as hearsay and incompetent.*]

A. He told me that he could talk most any distance, but his great object was to intensify, or get more power of tone.

Q. 9. Did he say anything about patenting it?

A. He said if he could get any one who would take a hold of it and go in with him, with capital, that he would get it patented; but that he was too poor to do it himself.

Q. 10. Did he say anything about the use of batteries, or anything of that kind, in connection with it?

A. When he gave me the explanation of the ground wire, he told me that it was connected with a battery, or magnet, or electricity from the earth, or something of that kind.

Adjourned until 2, P. M., for dinner.

Examination resumed, pursuant to adjournment at 2, o'clock, P. M.

Q. 11. How long did you remain examining the machines, and talking to Mr. Drawbaugh, during that visit?

A. I probably was there from an hour to an hour and a half.

Q. 12. How soon were you again at his shop afterwards?

A. As near as I can remember, from two to three weeks intervened. I know it was shortly after.

Q. 13. Do you think it was during the same month, November, or not?

A. No, sir; I think not. I think November had passed before my second visit.

Q. 14. Was it before Christmas, or after?

A. It was before; because just before Christmas I had got through at Mr. Boyer's for the time being.

Q. 15. How long were you there at that second visit?

A. I can't possibly give the length of my visit; but it was not long—merely a short visit; just stopping on my road.

Q. 16. Did you see any talking-machines, or have any talk with him about them, at the time of that second visit?

A. I saw the different parts of his apparatus on a bench, and I asked him how he was getting along with it, as I most always asked him when I went there. He said he was still in the same old position.

Q. 17. When were you there last?

A. My last visit was in the neighborhood of the latter part of 1879; but how near, I would not be positive of; it was sometime between October and November.

Q. 18. Did you see any talking-machines there at that time?

A. Yes, sir; I saw that he had changed one part of the instrument and placed another one in position.

Q. 19. Were you there at his shop at any time during the years 1877, 1878, and down to the time of your last visit? If so, how often, to the best of your recollection?

A. During the balance of 1876, I remained at Lisburn. I started to work again in the neighborhood of March, 1877. I then was working in Harrisburg; but just what months and at what points I would not be positive of. I worked part of the time for Mr. Boyer, part of the time for William Walker, and always walked, going and coming, except some few times, when I got a chance to ride. I then, in my homeward trip, would leave Harrisburg directly after dinner, on Saturdays, as a usual thing, and, when I would leave in good time, I would very often stop at his shop. During this time, I did some work also in Lisburn, and some close points in York county. I did not work constantly in Harrisburg. I have stopped as often as twice during a month, during my work, from that time on to March, 1878. About the 25th or 26th of March, as near as I can recollect, I moved to a house owned by Jacob Eshleman, on the Lisburn road, about a half a mile from Drawbaugh's shop, at Eberly's Mills. I lived in that house from that date until April 1st, 1879. During that time I worked some little in Harrisburg, but the most of my work was done right in my immediate neighborhood. I worked for Mr. Martin Best and others. Then I was at the shop a great deal. I worked for Peter McQuate, and that drew me to the shop a good deal. He lived on the Heck farm at that time. We used to gather at the shop on rainy days, because it was a good place. During 1879, I worked at the car shops, from 1st of April, 1879, until I moved away from there. During that time I was there a few times, but not so often. About the 1st of October, 1879, I went to work for the Lochiel rolling mill, and shortly after that I made preparations to move to Harrisburg. It was between the 1st of October and the 9th of December that I was last at his shop. The last-named day was my moving day. I know my last visit was not in December, because that would have been too near my moving day.

Q. 20. During all these visits to his shop, from November, 1876, to October or November, 1879, was Mr. Drawbaugh, or was he not, still giving his attention to his talking-machine, and working at it?

A. He was doing other work, but, at the same time, he was still working on this. During the time of my visits, he was manufacturing those clocks, to a great extent. He would suddenly drop what he had in his hand, and go to this apparatus, or different parts of this talking-machine, and he would do something—what it was, I am not prepared to say—and then he would try, and test. That he has done frequently while I was in the shop. If he had a piece of clock work in his hand, he would slam it down, fairly enough, as I thought, to injure it. Then he would go to some part of this talking-machine and do something that I can't explain, but I thought he was testing it. Sometimes he would remain at it half an hour and sometimes longer.

Q. 21. Please look at the machines, "A," "B," "C," "D," "E," "F," "H," and "J," now on the table before you, and state whether you saw any of these in the fall of 1876, and if so, which ones.

A. I saw this one, "C," and "B," and "F," also "A" and "H." In regard to "D," and "E," there is so much similarity connected with them that I would not positive. The one I saw had an attachment of covered wire.

Q. 22. Did you see, during that fall, at his shop, small round machines, like "D" and "E," having wrapped wire connected with?

A. I did.

Q. 23. Is there any mark about the machine "H" which particularly attracted your attraction at that time, and was the subject of comment by you at the time?

A. Those hinges are the marks. We asked him when he had got into the coffin business.

Q. 24. Referring to the fact that the hinges look like coffin hinges?

A. Yes, sir; those were the style of hinges that were used in open-faced old style coffins, before caskets came into use. The lid was in two parts and the hinges were at the high break; the upper portion of the lid opened back to disclose the face.

Q. 25. Was the bell on top of the machine "H," at the time that you first saw it?

A. Yes, sir.

Q. 26. In what position was that machine "H," at the time you first saw it, and what did Mr. Drawbaugh do with it, or say about it, at that time?

A. It was in an upright position, on a ledge over the bench. The ledge was between two of the studding of the wall of the building. Whether the machine was fastened against the wall or not, I could not say, but it was in a firm position. While I was there he opened it, and I saw the inside of it, and he also rang the bell from some point on the outside. He explained the idea of speaking into it, and the bell was for the purpose of calling attention. I don't recollect that he called it a talking-machine or any name, in particular. His whole idea, as I understood it, was the transmission of sound. When he explained the talking, he talked into this place [indicating the round mouth-piece on the front of "H."]

Q. 27. Was the machine, "H," connected with wires and batteries, at the time you first saw it?

A. There was wires connected with it on the side, and one wire ran down from the shop, which was in the second story, down through the floor, and he explained that that wire ran into the ground.

Q. 28. When did you first see the machine "J?"

A. As near as I can recollect, I saw this towards the latter part of my visits. I recollect seeing it there. At the time I saw it, it was in the position that "H" first occupied, although this one, "H," was still in sight.

Q. 29. Were any of these machines that are here on the table, and which we have been referring to in your testimony, seen by you at the time of your visit to Mr. Drawbaugh's shop? If so, which ones?

A. "C," "F," "B," "A," and "H," and something like "D" and "E," also; and different unconnected pieces, rims, &c., were seen by me at my first visit.

Q. 30. At that time of your first visit, how did the machine "A" look? Did it appear to have been just made, or to have been made a considerable time previously?

[*Objected to by Mr. Storrow.*]

A. It looked as bad then as it does now, and, in fact, I think, worse; for then it was all marked up with grease-marks, and in fact everything was all marked up with grease; also that one, "H." A machinist's hands are always black and greasy, and, of course, in handling anything they always mark it.

AMERICAN BELL TELEP

Q. 31. Did the machines "B," "C," and "F," when you first saw them, look new or old?

A. They looked old and worn with handling.

Q. 32. From your knowledge of what was going on at Mr. Drawbaugh's shop, from the time of your first visit to your last, what answer will you make to the question, whether he kept this talking-machine in mind, and kept at work at it during that time or not?

[*Objected to by Mr. Storrow as incompetent.*]

A. My knowledge is, that he was working at it pretty nearly all his spare time, and his only drawback was the want of capital to carry it through. He was a poor man and had hard times getting along, and he had to work enough to keep his family going, as we all do; a laboring man or mechanic has very little time to throw away, especially when he has a large family to support.

Cross-examination waived by Mr. Storrow.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 15th day of November, 1881.
FRED. M. OTT,
Examiner.

JOS. C. JEFFERIES.

JOHN T. SMITH, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is fifty years; my occupation, farming; residence, Franklin township, York county. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, and have known him since 1872.

Q. 1. How came you to get acquainted with him at that time?

A. I got a hydraulic ram put up.

Q. 2. Have you any paper or memorandum here showing the time?

A. Yes, sir; here is the bill I got when he finished the job.

[*The bill, copied by the examiner, is as follows. Offered in evidence by respondents' counsel.*

LEPHONE COMPANY,-2

"Clear Spring, York, Co., Pa.,
June 6, 1872.

John F. Smith,
to Daniel Drawbaugh, Dr.

1872.		
June 1st,	To one ram,	$15 00
	To 422 ft. ½ inch pipe @ 15 cents,	63 30
	To 50 ft. 1½ inch pipe @ 50 cents,	25 00
	To 1 union 1½ inch,	1 60
	To 2 do ½ do @ 60,	1 20
	To 1½ inch nipple,	10
	To 1½ inch ell,	15
	To 1 day putting up ram,	1 50
		$107 35

Received Payment,
Danl. Drawbaugh."]

Q. 3. Did you go to Mr. Drawbaugh's shop at the time when you got that ram?

A. Yes, sir; I was down about three weeks before he got everything fixed, and then he came up to my place and set it up for me.

Q. 4. When was the last time that you were ever at Mr. Drawbaugh's shop at Eberly's Mills?

A. In 1876.

Q. 5. At what time in 1876?

A. As near as I can tell, it was about the time when they had Pennsylvania week, or Pennsylvania day, at the Centennial, when they had excursions down. I don't know whether they had a whole week or one day, but it was in the week that had that day.

Q. 6. Are you sure that it was in the week that had that day in it?

A. I am not perfect; but I was in Dillsburg and heard the fellows talk about going to the Centennial, and that is the way I know it was pretty near that time.

Q. 7. How many times were you in Mr. Drawbaugh's shop, from the first to the last?

A. I think I was about four times; I can't tell exactly. The first time I was down to get the ram, and about three times after that, that it was out of order.

Q. 8. Did you ever see any talking-machines there at any of your visits?

A. He showed me a machine like this here pretty much [taking up "E."] It had two cords on, one green and the other red. He said it was to throw sound through, or speak through. It was not these, but pretty much like them. The cord had wire inside, with cord wrapped around it. That was all that I saw at that time; and then, about the same time, I saw that box "H." I don't remember that I ever saw "A," or "C," or "B," or "F." He might have shown me such a one as "A," but I don't recollect it.

Q. 9. When was it that you saw the large machine "H"?

A. I think I saw it between the first and last times, but before the last time, as near as I can recollect.

Q. 10. Where was it, and in what position, when you saw it?

A. It was lying on a table or bench, and the lid was open. I think some of the machinery was lying inside, but I can't tell whether it was in right shape or not.

Q. 11. Was the bell on top of it at that time?

A. Yes, sir; there was a bell on top of it.

Q. 12. Did you have any conversation with him about the large machine "H"?

A. Yes, he told me a little about it—how to make it; and that the bell is to give the alarm whenever he is ready to throw sound through.

Q. 13. Did he talk into the machine, or show you how to talk into it?

A. No, he had not showed me or had not talked in.

Q. 14. Did he say anything about getting it patented?

A. No, not that remember.

Q. 15. On how many different visits to the shop did you see any of the talking-machines, so far as you remember?

A. So far as I remember, I saw it a couple of times. Sometimes he was pretty busy when I was in the shop, and did not show it to me.

Q. 16. One of the machines that you saw was like this one, "E?"

A. Yes, it was like it, but I saw the very one this morning down in Mr. Jacobs' office, and I will step down and get it. [Witness returns with "N," and continues.] This is the one.

Q. 17. How do you distinguish this one, "N," as the one that you saw?

A. By these here two strings, [taking hold of the wrapped wires of instrument "N"]

Q. 18. Do you recollect that the size and shape of the instrument was like "N?"

A. Yes, sir.

LEPHONE COMPANY,-2

Cross-examined by Mr. Storrow:

Cross-Q. 19. How did you happen to go to Mr. Drawbaugh to get a ram?

A. He had a kind of a partner in building these rams, and he came along there one day and heard that I wanted the water brought up to my barn-yard, and he showed me something about it, and then I examined some other ones, but did not like them so well—rams made by other people—so I thought his would be the best machine.

Cross-Q. 20. Who was the partner?

A. Gardner. I forget his first name.

Cross-Q. 21. Do you mean that he went around selling rams?

A. No; but he put one up about four or five miles above my place, and then he came past my place and stopped to see whether I would not take one, too.

Cross-Q. 22. Was that the first you ever knew Drawbaugh?

A. I did not know him at that time. This man just stopped and showed me the working parts of the ram. This was about six months before I got mine.

Cross-Q. 23. Did you ever see any of his rams at any other place except your own?

A. Not before he showed me. But afterwards I went up to that place, about four miles above me, to see his ram work and to get a little information about it.

Cross-Q. 24. Who was that man who had the ram?

A. Joseph Trimmer.

Cross-Q. 25. How soon after you got your ram in did it first break down?

A. It froze and bursted the pipe for me in about eighteen months.

Cross-Q. 26. How soon after that did it break down again?

A. It broke down for me not quite a year after that. The clapper broke.

Cross-Q. 27. Did you take it to Drawbaugh's shop both times to get it mended?

A. Yes, sir.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 15th day of November, 1881.

FRED. M. OTT,
Examiner.

JOHN T. SMITH.

Adjourned until November 16th, 1881, at 10, o'clock, A. M.

November 16, 1881, *at* 10 *o'clock,* A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

No witnesses being produced, adjourned till 3.45 o'clock, P. M., when the examination was resumed, pursuant to adjournment.

ABRAHAM FISHER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is sixty years; residence, York Sulphur Springs, Adams county; occupation, keeping a summer resort, for the last fourteen years. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland Co., and have known him for twenty years.

Q. 1. Where did you live about 1868 to 1870?

A. I lived where I live now. I moved to the Springs in 1866, I think. The Springs are about twenty-four miles from Harrisburg.

Q. 2. Did you know Mr. Hursh, who was connected with the old Faucet Manufacturing Company, that were in operation there at Mr. Drawbaugh's shop, at Eberly's Mills, along about 1868 and 1869?

A. Yes, sir; I knew him well; he was a first cousin of mine.

Q. 3. He lived at or near Eberly's Mills, did he not?

A. Yes, he lived below; down at the creek; a couple of miles down; between New Cumberland and Eberly's Mills, about a mile from New Cumberland.

Q. 4. Did you visit him about that time?

A. Yes; we were together nearly every week.

Q. 5. Did you see anything of Daniel Drawbaugh about that time?

A. Yes, sir; we went up there one evening. He was connected there with Drawbaugh, and I went along up with him. I seen Drawbaugh different times out; but we went up to visit the works that evening.

Q. 6. While up there, did you have any talk with Drawbaugh about his talking-machine?

A. Yes; he was showing it to us there.

Q. 7. What did he say about it?

A. He said that he was going to bring that thing to perfection, and that he was making good progress with it.

[*Objected to as hearsay.*]

Q. 8. Did he say what it was for—what he could do with it?

[*Objected to by Mr. Storrow as above.*]

LEPHONE COMPANY,-2

A. Yes; he said it was for to talk through. He said he could talk through it some distance. He did not describe any particular distance—from one house to another in a town, or from one part of a house to another, he could convey sound. That is the way I understood him. He did not describe any particular distance.

Q. 9. Did he tell you on what principle it operated?

[*Objected to by Mr. Storrow.*]

A. By electricity.

Q. 10. Am I to understand you that he then showed you some of his talking-machines at that time?

A. Yes; he showed me that one box there at my side, [indicating "B" and "F."]

Q. 11. How long was that after Mr. Hursh went into the faucet business?

A. I don't think that it was over a year—not much.

Q. 12. Did you ever have occasion to get a hydraulic ram from Mr. Drawbaugh?

A. I did.

Q. 13. When did you get it from him?

A. In 1874, in the latter part of May.

Q. 14. Have you verified this date by looking at any books or memoranda made at the time?

A. Yes, sir.

Q. 15. When you got that ram, did you see Mr. Drawbaugh and have any talk with him at his shop?

A. Yes, sir.

Q. 16. Have you ever been at his shop since?

A. No, sir; I think not.

Q. 17. In the talk at his shop, at the time you got the ram, in May, 1874, was anything further said about his talking-machines?

A. Yes.

Q. 18. Did he show you any more talking-machines at that time?

A. Yes; he did.

Q. 19. Please look at this machine "A," and see whether you have any recollection of having seen it before to-day, and if so, when and where you first saw it?

A. He showed me different ones. I wouldn't like to swear that I saw this, but it strikes me that I saw this here "A." He showed me different ones that he was making—improvements that he was making.

Q. 20. Did he say anything at that time about patenting the invention?

A. He did.

Q. 21. What did he say about it?

A. He said that he had made application, or was going to; I would not be qualified as to which.

Q. 22. Did you have any conversation with him about the talking-machine between these two conversations that you have testified about?

A. I don't recollect.

Cross-examined by Mr. Storrow:

Cross-Q. 23. How did you come to go to Drawbaugh to buy a ram?

A. Because I was acquainted with him.

Cross-Q. 24. What did you pay him for the ram and putting it in?

A. I paid him about sixty dollars.

Cross-Q. 25. Did you ever see any of his rams anywhere else?

A. I did.

Cross-Q. 26. Where?

A. At Mr. Brant's, Harry Peters', and there was one working at Eberly's Springs. I don't know that I visited any others. I saw some others, but don't remember where. I think one was at Oyster's Point.

Cross-Q. 27. Did yours work right along, or did it ever break down?

A. It worked right along, as long as there was not muddy water. I did not use it then, as it threw muddy water up into the receptables at the house. This muddy water troubled me so much that I took it out in the summer of 1875.

Re-direct by Mr. Hill:

Q. Q. 28. Do you remember how much of that sixty dollars was paid for iron pipes that Mr. Drawbaugh furnished with the ram?

A. Not exactly, but it was over half. I forget how it ran. I think the pipe and the things cost a little more than the ram. I don't know exactly.

Q. Q. 29. Do you recollect whether the ram itself cost over fifteen dollars, outside of the labor and pipes?

A. I think fifteen or eighteen was the price of the ram itself, outside the attachments and labor.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 15th day of November, 1881.
FRED. M. OTT,
Examiner.

ABRAHAM FISHER.

N. N. HUBLER, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is forty-one; residence, 1205 Two-and-a-Half street, Harrisburg; occupation, foreman car-builder at the Harrisburg Car-works. I know Daniel Drawbaugh, of Eberly's Mills, and have known him since the fall of 1873.

Q. 1. How came you to make his acquaintance in the fall of 1873?

A. I was teaching music at Eberly's Mills.

Q. 2. How long did you teach there?

A. I was there once a week for about four months.

Q. 3. In what month did your school begin?

A. To the best of my knowledge, about the last of October or first of November.

Q. 4. While there teaching did you have any conversation with Mr. Drawbaugh about his talking-machines? If so, how many times?

A. I spoke with him several times; about the time I came there, and I recollect in January, 1874.

Q. 5. Did he show you some of his talking-machines?

A. He showed me some that are here now—or all these. I saw this, "I," and this, "B," and this, "F," and this, "C." I am not so sure about this one, "A."

Q. 6. Is the instrument "C," all here as you saw it then?

A. There was a magnet on it, then, like this [indicating "C" reproduced,] but I don't think the magnet was quite as large as the one on "C." reproduced

Q. 7–8. Did he talk to you through the machines?

A. He did not talk to me, [but he said he had talked to others.] I wanted him to talk to me, but the wires at that time were out of order, he said.

[*Part in brackets objected to by Mr. Storrow as hearsay.*]

Q. 9. At the conversation in January, 1874, did he say anything about patenting the invention? If so, what?

A. He said that he had it about completed, and was ready to have it patented. He said he did not have means, hardly, to do it, but would have to find some way to push it through.

Q. 10. Did any of his children attend your school?

A. There were two.

Q. 11. What did their tuition amount to?

A. One dollar a piece.

Q. 12. Did he pay you the tuition when you first asked him for it, or did he ask delay?

A. He told me that he did not have the money to pay me at the beginning, and said that if it did not make any difference to me he would pay at the end of the course. He said he did not have any money then. He spoke about his experimenting with these things.

Cross-examined by Mr. Storrow:

Cross-Q. 13. When did he pay you?

A. About the end, or very near the end, of the quarter.

Cross-Q. 14. Which of his children went to your school?

A. A son and a daughter; I don't remember the first names. One of them—the son—is grown up and works here in town. I find, from statements now made to me, that the one I have reference to, is "Shorty" Drawbaugh, who, I am told, is a nephew; I thought he was a son. Daniel Drawbaugh subscribed and paid for him.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 16th day of November, 1881.
FRED. M. OTT,
Examiner.

N. N. HUBLER.

Adjourned until November 17, 1881, at 10 o'clock, A. M.

November 17, 1881, 10 *o'clock*, A. M.

No witnesses being produced, after waiting until 11 o'clock, A. M., adjourned until 2.30 o'clock, P. M.

November 17, 1881, 2.30, P. M.

Examination resumed pursuant to adjournment.

Present same counsel, with the addition of Mr. Smith for complainants.

Mrs. LYDIA DRAWBAUGH, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

I reside at Milltown, Cumberland Co., Penna., and am the wife of

George W. Drawbaugh. I am acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, and have known him for about fifteen years.

Q. 1. Were you ever present at his shop when he was showing his talking-machines to anybody?

A. Yes, sir; once.

Q. 2. When was that?

A. In the year 1872, in the month of September.

Q. 3. Who was there in the shop with you?

A. Mrs. George Free; and there was a third person whose name I do not remember.

Q. 4. Did Mr. Drawbaugh talk to you through the talking-machines at that time?

A. No, sir.

Q. 5. Did he talk to the others of your party through the machines at that time?

A. I did not hear him.

Q. 6. Do you recollect what you were doing while the others were looking at the machines?

A. I was looking at some drawings that he had placed on the wall.

Q. 7. Did you see the talking-machines?

A. Yes, sir.

Q. 8. Is Mrs. Free, who accompanied you, your sister, and is she here present?

A. Yes, sir; she is my sister, and she is here present.

Cross-examined by Mr. Storrow:

Cross-Q. 9. When were you married?

A. In 1867.

Cross Q. 10. Where did you first live after you were married?

A. At Milltown.

Cross-Q 11. How long did you live there before you moved away?

A. I still live there.

Cross-Q. 12. What house do you live in?

A. At the upper end of Milltown; the second house as you come in from Mechanicsburg.

Cross-Q. 13. Where were these instruments when you saw them—in what part of the shop?

A. They were on the second floor.

Cross-Q. 14. Was that floor partitioned off then the way it is now?

A. I have not been in it lately. I cannot say.

Cross-Q. 15. How long were you there on that visit?

A. I can't just remember how long.

Cross-Q. 16. Is it your recollection that you were in there four or five minutes only, or that you stayed there a half hour or longer time?

A. I could not say whether it was a half hour or longer.

Cross-Q. 17. I understand you to mean that you did not just go in and stay there four or five minutes and come out again, but stayed there quite a little while. Is that so?

A. Yes, sir.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 17th day of Nov., 1881.
FRED. M. OTT,
Examiner.

MRS. LYDIA DRAWBAUGH.

MRS. MARY FREE, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

I am the wife of Mr. George Free, and reside at White Hill, Cumberland county, Pennsylvania. I am acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania, and have known him about fourteen years.

Q. 1. You heard the testimony which your sister, Mrs. Drawbaugh, has just given, did you not?

A. Yes, sir.

Q. 2. Do you recollect the visit to Mr. Daniel Drawbaugh's shop about which she testified?

A. Yes, sir.

Q. 3. In what year and month was that visit?

A. In 1872, in the month of September.

Q. 4. Did you see the talking-machines while there on that visit?

A. Yes, sir; I did.

Q. 5. Did you hear anything said through them by anybody?

A. Yes, sir; I did. Mr. Drawbaugh said "Good afternoon, ladies."

Q. 6. Was Mr. Drawbaugh in the same room with you, when he talked through the machine, or in some other part of the building?

A. He went to another part of the building.

Q. 7. Do you know whether he went down stairs, or whether he went to some other part of the same floor?

A. I really could not tell that.

Q. 8. Did he go out of the room for the purpose of talking to you ladies through the machine, in order that you might hear it for yourselves?

A. Yes, sir; he did.

Q. 9. Was it while he was out of the room that you heard the words "Good afternoon, ladies," spoken through the machine?

A. Yes, sir.

Q. 10. Did he speak other words through the machine to you, which you heard, or was that all he said through the machine?

A. He said more, but I have forgotten what they were.

Q. 11. Could you plainly hear through the machine what he was saying or not?

A. Yes, sir.

Q. 12. Did he whisper or sing through the machine to you also?

A. No, sir; just talked.

Q. 13. Were there any wires connected to the machine?

A. There were.

Q. 14. Did he tell you how the machine operated, or what it was that conveyed his voice through to you?

A. He said it was by electricity.

Q. 15. Do you remember whether or not his voice sounded like the voice of Daniel Drawbaugh? That is, whether, when he was talking to you through the machine, you could distinguish the voice as being Daniel Drawbaugh's voice, and as not being the voice of some one else?

A. Yes, sir; I recognized it as his voice.

Q. 16. Do you remember who the person was who was there with you and your sister?

A. No, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 17. Is your husband, Mr. Free, present?

A. Yes, sir.

Cross-Q. 18. Is he the Mr. George Free who has testified in this case?

A. Yes, sir.

Re-direct by Mr. Hill:

Q. Q. 19. Did your husband accompany you here at your request after you had been subpœnaed?

A. Yes, sir; he did.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 17th day of November, 1881.

FRED. M. OTT,
Examiner.

MRS. GEO. FREE.

Adjourned until November 18th, at 10 o'clock, A. M.

November 18, 1881, 10 *o'clock*, A. M.

No witnesses being produced, adjourned until 2.30 o'clock, P. M.

November 18, 2.30 *o'clock*, P. M.

Examination resumed pursuant to adjournment.

Present, Mr. Smith and Mr. Storrow for complainants, and Mr. Jacobs for respondents.

GEORGE LEONARD, *being produced, affirmed, and examined, saith:*

Examined by Mr. Jacobs:

My age is seventy-one; reside near New Kingston, Cumberland county; occupation, farmer. I know Daniel Drawbaugh, of Eberly's Mills, and have known him for about ten years.

Q. 1. Did you ever reside at Eberly's Mills, and if so, from what time to what time?

A. From 1871, when I went there; and I left in 1878, I think. It was three years ago last spring that I left.

Q. 2. State whether or not you were, during a part of that time, the owner of the mill at that place.

A. Yes, sir; five years I owned the mill and carried it on; that was my occupation—milling and selling flour; but I lived there two years after I sold the mill; so that I lived there seven years in all.

Q. 3. When did you purchase and take possession of the mill?

A. I think I purchased the mill the January before I moved there.

I moved there in the spring of 1871. I could have had possession of it two or three weeks before, but I did not take it, as they were doing nothing.

Q. 4. Then I understand that you owned and had possession of the mill from 1871 to 1876. Is that correct?

A. Yes, sir; it was in 1876 that Dellinger and May got possession.

Q. 5. William S. Dellinger?

A. Yes, sir; that is his name.

Q. 6. In what month, if you remember, did they take possession?

A. The first of March, 1876, I suppose. They got the possession of the mill on the first of March, but there were four houses that they did not get possession of until the first of April. They were in the possession of tenants up to that time.

Q. 7. Whom did you succeed in the possession of the mill?

A. John Beetem; he and Christ. Eberly owned it together. Mr. Hepburn, of Carlisle, did the business for Mr. Eberly, and George Beetem acted in the matter for his brother John.

Q. 8. Was John Beetem a Carlisle man?

A. He was at that time. He got to drinking and doing badly, and his brother George had to manage his business for him. That was what I understood at the time.

Q. 9. State whether or not, during the time you ran the mill, you had any business transactions with Daniel Drawbaugh. If so, what was their nature?

A. He bought flour for the support of his family, and, occasionally, hog-feed; he kept a couple of hogs, or three.

Q. 10. Did he always pay you in cash?

A. No, sir; he would very often pay a part, and a part we would book.

Q. 11. State whether or not, during that time, he was often in your debt for flour and feed.

A. Yes, sir; I think he was never clear of it from the time I commenced dealing with him till I went away.

Q. 12. Did you ever ask him to pay?

A. Yes, sir; I asked him at the end of every year and tried to settle up with him, as I wanted to use the money myself.

Q. 13. What reason, if any, did he give for not paying you off?

A. He still said that he had not the money.

Q. 14. Were you at the Centennial, and if so, when and with whom did you go?

A. Yes, sir; I went in company with Mr. Daniel Drawbaugh. I think it was somewhere about the middle or 20th of October, 1876.

Q. 15. What did the trip cost you?

A. I think about ten dollars, as near as I can tell, including all my expenses, boarding, lodging, fare, &c.

Q. 16. Had Mr. Drawbaugh ever said anything to you about his talking-machine before you went with him to the Centennial, and if so, when, as near as you can recollect?

A. I heard him talk that he was working at a talking-machine some time between the years 1871 and 1876, and I heard some of the neighbors saying, too, that he was working on such a thing, but I never saw it. He told me himself that he was working at it, but I cannot say I ever saw it. I may have seen it, but I cannot say I did, because I took no interest in it. I did not understand the thing. It was not in my line of business.

Cross-examined by Mr. Smith:

Cross-Q. 17. How long a time did you and Mr. Drawbaugh spend at the Centennial?

A. As near as I can recollect, about three days.

Cross-Q. 18. Where did you board while there?

A. We boarded at a private house, perhaps a mile out from the Centennial grounds. I am not able to give the name and the street, as I am so little acquainted in Philadelphia. I had an account in a little pass-book, but I lost it. It was an Irish family that we boarded with.

Cross-Q. 19. Did any other persons go in company with you and Mr. Drawbaugh?

A. No, sir; not to that place.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 18th day of November, 1881.
FRED. M. OTT,
Examiner.

GEO. LEONARD.

WILLIAM F. LENIG, *being produced, sworn, and examined, saith:*

Examined by Mr. Jacobs:

My age is forty; residence, 1524 Vernon street, Harrisburg; occupation, blacksmith; I am now running machinery. I quit my trade because I could not stand it. I am employed at the Harrisburg Car Works. I know Daniel Drawbaugh, of Eberly's Mills, and have known him since 1874—about eight years.

Q. 1. How did you come to make his acquaintance?

A. Mr. Hubler was teaching singing-school at Eberly's Mills, or Milltown, and he wanted me to go along over to see some of Mr. Drawbaugh's machinery—that he had a great invention called the talking-machine. I concluded then to go along to see this machine. After I got there, I seen it, and I thought it was a humbug the time I looked at it. He then had his wires stretched through his shop some place Mr. Hubler then asked him whether he could talk through. He said he could not at the present, but that he had talked through before—that one of the wires was unhooked, or something.

Q. 2. Did he say anything about the use of electricity in connection with it?

A. Yes, sir; he did. He told us—whether it was in his cellar or outside of his shop, I am not sure. I know that he would have taken us down, but it was a windy night, and the light blew out.

Q. 3. Did he tell you how far he thought he could talk through it?

A. He told us then that he could talk hundreds of miles through that.

Q. 4. Did he or not say anything about getting it patented, and if so, what did he say?

A. He did afterwards. He said then, he is about ready, or soon ready, to get it patented, but that he had not the money or "stamps," or something like that.

Q. 5. Do you mean that he said that upon the night you have mentioned, or at a subsequent time?

A. Yes, sir; he mentioned it the same evening.

Q. 6. Please look at the instrument which I now show you, marked "C," and say whether you saw it at that visit.

A. I recognize this here instrument; something more was on top of it, in the shape of something like that [pointing to horse-shoe magnet of "C reproduced."]

Q. 7. Same question as to instrument marked "A."

A. I seen something similar to this here [indicating "A."] He called it a mouth-piece.

Q. 8. Did he tell you what it was for?

Q. 14. Were you at the Centennial, and if so, when and with whom did you go?

A. Yes, sir; I went in company with Mr. Daniel Drawbaugh. I think it was somewhere about the middle or 20th of October, 1876.

Q. 15. What did the trip cost you?

A. I think about ten dollars, as near as I can tell, including all my expenses, boarding, lodging, fare, &c.

Q. 16. Had Mr. Drawbaugh ever said anything to you about his talking-machine before you went with him to the Centennial, and if so, when, as near as you can recollect?

A. I heard him talk that he was working at a talking-machine some time between the years 1871 and 1876, and I heard some of the neighbors saying, too, that he was working on such a thing, but I never saw it. He told me himself that he was working at it, but I cannot say I ever saw it. I may have seen it, but I cannot say I did, because I took no interest in it. I did not understand the thing. It was not in my line of business.

Cross-examined by Mr. Smith:

Cross-Q. 17. How long a time did you and Mr. Drawbaugh spend at the Centennial?

A. As near as I can recollect, about three days.

Cross-Q. 18. Where did you board while there?

A. We boarded at a private house, perhaps a mile out from the Centennial grounds. I am not able to give the name and the street, as I am so little acquainted in Philadelphia. I had an account in a little pass-book, but I lost it. It was an Irish family that we boarded with.

Cross-Q. 19. Did any other persons go in company with you and Mr. Drawbaugh?

A. No, sir; not to that place.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 18th day of November, 1881.
FRED. M. OTT,

Q. 8. Did he tell you what it was for?

A. Yes, sir; he said that was to talk through.

Q. 9. By what name did he then call it, if you recollect?

A. He then called it the talking-machine; that is about the only name he had for it.

Q. 10. Can you fix the month as well as the year of that visit?

A. It was either January or February, 1874; I could not certainly say which.

Q. 11. And the visit was to Drawbaugh's shop, at Eberly's Mills, or Milltown, as I understand?

A. Yes, sir.

Cross-examination waived by Mr. Smith.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 18th day of November, 1881.

FRED. M. OTT,
Examiner.

WILLIAM F. LENIG.

Adjourned until 5 o'clock, P. M.

Nov. 18, 1881, 5 *o'clock,* P. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow and Mr. Smith for complainants, and Mr. Jacobs for respondents.

SAMUEL M. HERTZLER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Jacobs:

My age is forty-six; residence, Eberly's Mills, Cumberland county; occupation, farming. I know Daniel Drawbaugh, of Eberly's Mills, and have known him since 1866.

Q. 1. Have you any knowledge of his pecuniary condition between the years 1870 and 1880, and if so, state what it was.

A. He was very poor; at times he had money, but it did not last very long.

Q. 2. Did you have any transactions with him during that period?

A. Yes, sir; he would very frequently buy as small a quantity as a half peck of apples, and had no money to pay for it; and he would buy lard—about two pounds at a time; and mince-meat, generally two pounds at a time, and did not pay for any of it.

Q. 3. Did he or not pay you cash when he had it?

A. Yes, sir; he did. When he had it he always paid cash. He mostly sent the children for those articles. When they had not the money the children would always say their father would fix this with me.

Q. 4. Do you remember the time of his father's death, and if so, when was it, and what occurred between you and Mr. Drawbaugh?

A. I remember the time, but the date I cannot fix. I remember what occurred, but the year has slipped my memory entirely. He came to my place in the evening, when the next day the funeral of his father was to be, and he said that he would like to attend the funeral, and wanted to know if I would give him enough money to pay his way. I then asked him whether he was going alone. He said his wife should go, but he was afraid that he could not get the money for them both. I asked him about the children. He said that they have not got the clothes. I think that was the excuse he made about the children, that they had not clothes suitable. I then asked him how much the fare would be to Newville, where his father lived, and he thought about ninety cents, one way, would be the cost of a ticket. Then I asked him whether he thought five dollars would be enough. He said that it would. I gave him five dollars, and he gave me a due bill, and promised that he would pay it in a very short time. He never paid it in money. He spoke of it different times and said that he was ashamed that he could not pay me, but that he would pay it before long.

Q. 5. How did he pay that, if he ever did?

A. I don't think he ever gave full value for it. He filed my saws several times and done me favors in that way. He fixed a pruning shears—put a spring in. I remember that very distinctly.

Q. 6. Can you approximate the date of this occurrence?

A. I could have fixed the time exactly from my accounts if I had referred to them. To the best of my recollection, it was from 1868 to 1878. As to the funeral, I remember the occurrence, but can't fix the date. The buying of the lard and other things were from 1866 on.

Cross-examined by Mr. Storrow:

Cross-Q. 7. Was this the night before the funeral that he came to you?

A. It was the evening when the funeral was to be the next day.

Cross-Q. 8. Summer or winter?

A. I think it was in the fall.

Cross-Q. 9. How long have you lived at Eberly's Mills?

A. Since 1866.

Cross-Q. 10. You own a rather large farm there, don't you?

A. I suppose my two together would make a large farm.

Cross-Q. 11. Your two farms would be about the biggest any one owns there, wouldn't they?

A. Yes, that joins Eberly's Mills.

Cross-Q. 12. How many acres in both of them together?

A. Something over two hundred.

Cross-Q. 13. Was Mr. George Leonard reckoned among the neighbors to be a man pretty well off in means?

A. Tolerably well, at one time.

Cross-Q. 14. I understand you to mean that the way you knew that Drawbaugh had not the cash to pay you was by his children saying that their father would fix it with you. Is that the fact?

A. No, sir; when he had the money, he would send it with the children; and when he was to fix it with me I would charge it, and he would never fix it from one year's end to another; and if I would ask him about his account he would say that he would pay it as soon as he gets the money, but he had not the money. That is the reason the children had them orders.

Cross-Q. 15. You were a member of the Drawbaugh Manufacturing Company, were not you?

A. Yes, sir.

Cross-Q. 16. Did he do repairs for you before the time when his father died?

A. Yes, sir; he did.

Cross-Q. 17. What kind of repairs?

A. He ground my shears several times.

Cross-Q. 18. Did he do repairs for the neighbors generally?

A. Yes, sir; he would do favors of that kind and would drop almost anything to do them.

Cross-Q. 19. Did he repair reapers and farm machinery for the neighbors during that time?

A. He never did for me, but I seen reapers and corn-shellers there at Dan's shop at different times.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 18th day of November, 1881.
FRED. M. OTT,
Examiner.

S. M. HERTZLER.

Adjourned until December 1st, 1881, at 2 o'clock, P. M.

Thursday, December 1st, 1881, 2 *o'clock,* P. M.

Examination resumed pursuant to adjournment.

Present, Mr. Hill for respondents, and Mr. Storrow for complainants.

WILLIAM H. H. KNIGHT, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is thirty-two; residence, Washington, D. C.; occupation, civil and mechanical engineer and draughtsman.

Q. 1. Have you been accustomed to making mechanical drawings, to be filed in the Patent Office, in connection with applications for patents?

A. I have.

Q. 2. Have you been accustomed to making accurate plans and drawings for the construction of machinery, and also drawings from machinery?

A. I have.

Q. 3. Are you familiar with the telephone instruments marked alphabetically from A to Q, inclusive, which have been referred to here in this case by the various witnesses for the defense?

A. I am.

Q. 4. Have you made drawings of those instruments to be filed with the evidence in the case?

A. I have made such drawings, twenty-five sheets in number.

Q. 5. Will you produce the twenty-five sheets that you have made in order that I may put them in evidence?

A. I here produce the drawings referred to in the last answer.

[*Mr. Hill puts the twenty-five sheets of drawings in evidence, marked as follows:*

Exhibit A drawing.
" B drawing.
" reproduced B drawing.
" C drawing.
" reproduced C drawing.
" D drawing.
" E drawing.
" F drawing.
" G drawing.
" reproduced F drawing.
" H drawing, sheet 1.
" H drawing, sheet 2.
" H drawing, sheet 3.
" I drawing.
" K drawing.
" reproduced I drawing, No. 1.
" reproduced I drawing, No. 2.
" J drawing, sheet 1.
" J drawing, sheet 2.
" J drawing, sheet 3.
" L drawing.
" M drawing.
" reproduced L drawing.
" reproduced M drawing.
" N drawing.
" O drawing.
" Q drawing.
" P drawing, sheet 1.
" P drawing, sheet 2.
" reproduced P drawing, sheet 1.
" reproduced P drawing, sheet 2.
" reproduced P drawing, sheet 3.

Mr. Hill also puts in evidence photo-lithographs of said respective drawings.]

The original drawings, above put in evidence, are full-size drawings of the several machines. The photo-lithographs are photo-lithographs of the said full-size drawings, but were reduced to half-size by the photo-lithographer; so that, although they bear the words "full-size," those words refer to the original drawings, and not the photo-lithographs.

[*The photo-lithographs, now put in evidence, are marked respectively as follows, to wit:*

Exhibit photo-lithograph A drawing.
" " " B drawing.
" " " reproduced B drawing.

Q. 6. Have you examined the photo-lithographs which I have jnst put in evidence? If yes, state whether they are accurate reproductions of the original drawings, and upon what scale, as compared with the original drawings.

A. I have; they are accurate copies, one-half size of original drawings.

Q. 7. State whether you made the original drawings from the machines marked from "A" to "Q," inclusive, which have been referred to by defendants' witnesses.

A. I did, and, in all instances, made as correct a drawing as I possibly could.

Q. 8. Upon what scale are the original drawings made, as compared with the machines which they represent?

A. They are made to the actual size of the machines—full size.

Q. 9. Is each part, which is shown in the drawings, made of the actual size of and dimensions of the corresponding part in the machine represented?

A. They are, as nearly as I could make them, by measurement with instruments.

Q. 10. Did you measure each part of every instrument, in order to obtain the actual dimensions correctly?

A. I did; I measured them with calipers and dividers.

Q. 11. How did you obtain the relative positions of the different parts—their distances from each other, and their arrangement in the several machines?

A. By measurement.

Q. 12. Did you employ a very unusual amount of care in securing perfect accuracy in these drawings, or only the ordinary care?

A. I gave these drawings more care than I ever bestowed on any other drawing. In all cases I remeasured to see that I was perfectly correct. Sometimes I went over them four or five times after penciling them.

Q. 13. Then are you willing to swear that these drawings are perfectly accurate, so far as accuracy can be obtained by the ordinary drawing and measuring instruments?

A. I can, I think.

Q. 14. You stated orally here, a little while ago, that one of the drawings, to wit: The one marked "Exhibit reproduced I drawing, No. 1," was made in part, not from the machine itself, but from explanation and statements given to you by Mr. Daniel Drawbaugh, at the time. Is that the fact?

A. It is; the body of the instrument I copied from the original instrument marked "I." The works contained within said body were drawn from explanations given by Mr. Drawbaugh. During the time that I was making the drawing, Mr. Drawbaugh brought over the instrument, "reproduced I," which I compared with the drawing.

Q. 15. Where did you make all the drawings?

A. At the office of M. W. Jacobs, Harrisburg, Pennsylvania.

Q. 16. I observe that the several drawings are dated. What are those dates intended to show?

A. The time at which each drawing was made.

Q. 17. Were the several machines adjusted to an actual working adjustment when you made the drawings, or only adjusted approximately?

A. I could not say as to that, not having used or experimented with them. From their appearance in many cases I should judge them to have been in working condition.

Q. 18. Where you found any part of the machine wanting, that part was omitted in the drawing, was it?

A. In all but one case, to wit: "Exhibit K drawing," I added the connecting piece marked *é*. Mr. Drawbaugh stated that the piece had been there, and the soldering on the instrument showed that it had been broken off, and there was an aperture in the diaphragm to receive it. In two or three of the carbon instruments, I represented the missing carbons by dotted lines.

Q. 19. In "Exhibit B drawing," the electro-magnet is represented at a greater distance from the diaphragm end of the tube than in "Exhibit reproduced B drawing." State whether that electro-magnet in the original machine was somewhat loose in its fastening, by reason of age, so as to be easily moved towards or from the tube.

A. The electro-magnet was confined to a block, and held thereto quite rigid, but the tube [marked B] was loosely held by the strap [marked C] and while the strap prevented the tube from dropping out, it would not and did not prevent longitudinal movement of said tube. I did not at the time of drawing try to obtain any particular adjustment of the tube to the magnet, as I did not think of it. I only aimed at giving relative size of each.

Q. 20. Did you put the letters of reference on the several drawings, and if so, for what purpose?

A. I did; in order that each part might be readily found and distinguished.

Q. 21. I suppose you found it necessary to take many of the machines apart, in order to measure the dimensions of their component parts, did you not?

A. I did.

Q. 22. When you had done this, did you put them together again as accurately as you could?

A. I did, as nearly as possible.

Cross-examined by Mr. Storrow:

Cross-Q. 23. When did you first see any of these instruments?

A. I first saw them one year ago last summer, or spring. I think in June or July, 1880.

Cross-Q. 24. Where?

A. At Washington.

Cross-Q. 25. Where, in Washington?

A. At the office of L. Hill, 617 Seventh street.

Cross-Q. 26. What occasion had you to see them then?

A. I made Patent-Office drawings for some of them.

Cross-Q. 27. Which?

A. I do not just remember which they were; but think instruments "J," "L," and "M" were among the number. I would say, however, in making office drawings, I do not charge my mind with the remembrance of the machines drawn.

Cross-Q. 28. In "Exhibit A," what is the bracket F and its adjusting screw made of?

A. The bracket, I think, is of brass, and also the adjusting screw, I think. I have not the machines before me, but that is as nearly as I can remember.

Cross-Q. 29. In "Exhibit B," what is the piece H made of?

A. Of tin, as nearly as I can remember.

Cross-Q. 30. I see that you have called it "H, tension plate to tighten diaphragm." Who gave you that name for it, and who told you what it was for?

A. I knew its purpose myself, from my knowledge of mechanics. I had in my mind another term to apply to it, and I asked Mr. Drawbaugh what would be the shop term.

Cross-Q. 31. Was there any diaphragm on the instrument when you first saw it?

A. A portion of the diaphragm was surrounding the tube, held in place by twine, as it is now, or was when I last saw it.

Cross-Q. 32. The end of the tube was entirely open, was it not?

A. It was.

Cross-Q. 33. Where did you ever see a device like H, used to tighten a diaphragm?

A. I do not remember having seen it in any telephone, but the plate H corresponds to springs that I have seen used in machines, for the

ELEPHONE COMPANY,-2

purpose of pressure or tension. From this fact, I judged that it was so used in this instrument.

Cross-Q. 34. Did you ever see such a spring used to produce tension in a vibrating diaphragm? If so, where?

A. As I before stated, I do not remember having seen such a spring in a telephone, but have seen such springs in other machines.

Cross-Q. 35. Did you ever see such a spring used in connection with a diaphragm in any kind of a machine? If so, what?

A. The machines I had in mind more particularly were cord tensions in harvester-binders, and the tensions in certain sewing-machines.

Cross-Q. 36. Your drawing of "Exhibit C" states that a second or auxiliary diaphragm of gold-beater's skin was originally used. Did such a diaphragm exist in that instrument when you first saw it?

A. When making this drawing, I noticed a fragment on the edge of what appeared to be paper or bladder or something of that nature, surrounding the body of the instrument, and held in place by a flange or ring. I asked Mr. Drawbaugh what the purpose of this fragment was. He answered that it was a portion of a diaphragm of gold-beater's skin that had once been used in the instrument.

Cross-Q. 37. In your drawing of "Exhibit C reproduced" you say: "This instrument is similar in all respects to original instrument marked 'C.'" I suppose you mean by that that they are similar in those respects in which your drawings show no difference, do you?

A. I meant by that note that the sizes of the base, upright, and body of the instrument were similar, and the relation of each of the parts named was similar, so far as was shown. The object of this note in the drawing of the reproduced instrument was merely to avoid making drawings that I did not deem necessary. I mean the front elevation, rear elevation and section, such as I made for "C."

Cross-Q. 38. Has "C reproduced" got an auxiliary diaphragm of gold-beater's skin?

A. I do not now remember. It has been some time since I saw the instrument.

Cross-Q. 39. In "Exhibit D," of what material is the adjustable plug *é* made?

A. It is made of soft iron, as nearly as I can remember.

Cross-Q. 40. Of what material are the cheeks between which the coil of "D" is wound? I refer to the plates that carry the letters C—the two ends of the spool.

A. I do not at this moment remember, but think they are of brass.

Cross-Q. 41. Of what material is the diaphragm?

A. Of tinned iron.

Cross-Q. 42. What material is it in "E?"

A. I think in that case, if I remember rightly, it is of sheet-iron.

Cross-Q. 43. In "Exhibit F," is that part of the adjusting rod C, which is above the plates, straight or bent?

A. It is straight. It passes out through the cap at a slight inclination from the perpendicular.

Cross-Q. 44. About parallel to the side of the tumbler, is it not?

A. Yes; the drawing shows a slight inclination, but, as you are looking directly at it, you do not see the inclination perfectly.

Cross-Q. 45. The ragged line at the bottom of the tumbler in your drawing signifies the way in which the bottom is broken off, I suppose?

A. It does; as it appeared when making the view shown in the drawing.

Cross-Q. 46. In your drawing of "G," I observe, in dotted lines, something which you have called "H—carbon ball." I understand from your direct testimony that the instrument did not contain what you have shown as a ball, when it came to your hands, and that that is the reason why you put it in dotted lines. Is that so?

A. In my direct testimony, I stated that when the carbon balls were missing, the position was shown by dotted lines in two or three instances. In the instrument in question, there was one carbon ball that is lettered "H," the dotted lines not being lettered. The photo-lithograph does not bring that out clearly. In the original drawing, the "H" is placed in the clear space beside the carbon ball, a reference line being drawn from said ball to the letter.

Cross-Q. 47. In "F reproduced," of what material is the bar *e*?

A. I think it is a small iron wire.

Cross-Q. 48. I suppose you did not undertake to draw that to scale, as to diameter?

A. Yes, sir; I measured that with calipers.

Cross-Q. 49. Is the drawing "H, sheet 2," one of the cases where you represented by dotted lines something which did not exist in the instrument when you saw it?

A. In this drawing, the carbons that are dotted are not in the instrument, but the dotted portions shown on the body of the instrument, on its side, represent the screws for attaching binding-posts to the wood,

LEPHONE COMPANY,-2

the outline of the switch-screw L, and the stem or shaft, of the button or key K^2, and the outline of the switch contact L^2, also the clapper-stem of the bell, where it passes through the wood. In the longitudinal section, body of screw g^2 is indicated by dotted lines, as is also a rivet not marked. The carbons indicated by dotted lines are the only parts so indicated that are wanting in the machine.

Cross-Q. 50. I observe that you have two sheets of drawings of "Exhibit I." I suppose that the one dated April 28, 1881, represents the instrument as it then existed, does it not?

A. That is the original instrument. The drawings are made as accurately, as regards size, as I could make them.

Cross-Q. 51. The diaphragms and electro-magnet shown in your drawing of July 12, 1881, were added to the instrument after you made your drawing of April 28, 1881, were they not?

A. The drawing of instrument "I" was made July 12th, as I stated before, partly from the old instrument and partly from explanations made by Mr. Drawbaugh, and partly from having the magnets placed in the instruments. Mr. Drawbaugh found them and placed them in. I had the old diaphragm before, with a mass of old diaphragms, and I found it would fit the instrument, and he said it was the one.

Cross-Q. 52. When you made the drawing of April 28th, it was not known whether the diaphragm and electro-magnet of that instrument existed, was it?

A. At that time, and previous to that time, I had heard nothing about it, my instructions being to draw the instruments as they then were.

Adjourned until December 2, 1881, at 10, A. M.

December 2, 1881, 10 *o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

Cross-examination of Mr. Knight by Mr. Storrow continued:

Cross-Q. 53. I wish you would compare your fourteenth answer with your fifty-first. Do you mean in your fifty-first answer to refer to your drawing of July 12th or to the drawing of July 22d?

A. In both answers, I referred solely to the drawing of July 12th. I supposed that the drawing of July 22d would be numbered No. 1.

Cross-Q. 54. The instruments "D," "E," "L," "M," "N," "O," "P," "Q," are stated in your drawings to have permanent magnets. Of what material are those magnets?

A. Of steel.

Cross-Q. 55. In the drawing of "J," sheet 2, longitudinal section, the piece E′ was empty when it was brought to you, was it not? And the dotted lines you have put in connection with it were put there for the reasons you have already explained, were they not?

A. It was empty. Whenever carbon balls were wanting, I indicated their position by dotted lines, as I have stated before.

[*Mr. Storrow objects to the drawings marked drawings of reproductions for the reasons that the instruments of which they purport to be drawings have not been put in evidence and most of them have not been produced.*

Mr. Hill states that said reproduced instruments will be put in evidence, and, if Mr. Storrow desires, the witness will be recalled for his further cross-examination upon them hereafter.]

Re-direct by Mr. Hill:

Q. Q. 56. Have you the instrument "A" before you this morning?

A. I have.

Q. Q. 57. Referring now to "Exhibit A drawing," and to the machine "A" in your hands, are the statements contained in said table of references correct, so far as they state the material of the several parts of machine "A"?

A. They are.

Q. Q. 58. What is the material of which the case A, the cover, or cap B, the mouth-piece I, and the thin diaphragm C, are severally made?

A. Of black walnut.

Q. Q. 59. The adjusting screw B′ is of brass, is it not?

A. It is.

Q. Q. 60. What is the small block *b* made of?

A. It is made of brass.

Q. Q. 61. The thin plate attached to the diaphragm on the side next to the screw B′ and marked *c* is of rubber, is it not?

A. It is; it is soft rubber; If it is at all vulcanized, it is very slightly.

Q. Q. 62. Of what material is the armature *d* on the diaphragm?

A. Iron.

Q. Q. 63. Of what material are the bracket F and its adjusting screw G?

A. Of brass.

Q. Q. 64. Of what material are the ends of the spools D of the electro-magnet?

A. Of wood.

Q. Q. 65. Of what material are the connections from the bracket to the electro-magnet, which are marked E, f^2?

A. Of iron.

Q. Q. 66. Of what material are the cases of the electro-magnet?

A. Of soft iron.

Q. Q. 67. In the figures which represent the diaphragm, I observe four notches through the edges. Are those to accommodate the bolts which hold the cap B to the case A?

A. They are. When made they were probably round perforations, afterward becoming broken and jagged as shown.

Q. Q. 68. Is the wire on the electro-magnet, and extending thence to the screw parts H, the ordinary wrapped or insulated electric wire?

A. It is.

Q. Q. 69. Have you the instrument marked "B" now in your hands?

A. I have.

Q. Q. 70. Please compare it with "Exhibit B drawing" and the table of references marked thereon, and state whether said table is correct in its statement of the materials of which the different parts thereof are composed.

A. It is. I find, however, that the plaster-of-Paris lining, shown in the drawing as in tube B, is missing in the instrument.

Q. Q. 71. You were several months in making the drawings which I have put in evidence, were you not?

A. I was; some three months.

Q. Q. 72. You saw the instruments almost every day during that time, did you not?

A. I did.

Q. Q. 73. Were the instruments handled a great deal during last April, May, June, July, and August, in the making of the drawings, carrying the instruments back and forth from their place of deposit to the examiner's office, and in the taking of depositions in the examiner's office?

A. They were handled a great deal of necessity and sometimes were subjected to pretty rough usage.

Q. Q. 74. From your knowledge and experience of the effect of such handling upon delicately adjusted instruments, would you say that it improved them, or the contrary?

A. Most decidedly the contrary.

Q. Q. 75. Referring again to instrument "B," please state whether the wooden block L is or is not made in the form of a bridge, having a recess through its under side to accommodate the tension-plate H.

A. Yes; it is made in such form, having the recess on its lower surface shown in figure marked "Section on line *xx*," lower right hand of "Exhibit B drawing."

Q. Q. 76. Is the tension-plate H attached to the block L or to the base A?

A. It is attached to the base A, by a regulating or adjusting screw, marked I, in the drawing.

Q. Q. 77. Has the screw, marked G, in "Exhibit B drawing," any electric connection with the magnet, or with the instrument, or is it merely a holding screw to secure the electro-magnet in place?

A. It has no electric connection whatever, its purpose being solely to hold the electro-magnet in place, upon the bridge L and to the base A.

Q. Q. 78. State whether the tension-plate H has any electric connection to any part of the instrument.

A. It has not. Its position indicates a mere diaphragm-tightening spring.

Q. Q. 79. Referring again to "Exhibit A drawing," please state whether the screw B′ has any electric connection with the diaphragm.

A. It has not. Its purpose, I should judge, being simply to regulate the diaphragm.

Q. Q. 80. In "Exhibit reproduced B drawing," are the poles of the electro-magnet represented as in contact with the diaphragm or not?

A. They are not in contact.

Q. Q. 81. In that drawing, in the lower figure marked "side elevation," something is seen between the pole of the electro-magnet and the armature. What is that something, and where is it?

A. It is the upper free end of the tension-plate G, and is not between the pole of the magnet and the armature, but bears against said armature, at a point equi-distant from each of the poles. In the figure referred to, the plate G is shown by dotted lines, where it passes through or under the bridge F.

Q. Q. 82. Then, in that figure, you look through between the pole and the armature and see the end of plate G half an inch or thereabouts beyond the pole. Is that the fact? I mean on the further side of the pole.

A. It is the fact; that is the way you see it.

Q. Q. 83. In "Exhibit reproduced B drawing" and in the machine thereby represented, what is the diaphragm composed of?

A. It is made of a piece of bladder.

Q. Q. 84. And what the armature?

A. Of soft iron.

Q. Q. 85. In all the reference tables and notes which you have made on the several drawings that have been put in evidence, are the statements contained in the said several tables and notes correct as to the materials of which the several parts of all the machines were made?

A. They are.

Q. Q. 86. Have you the instrument "F" in your hands?

A. I have.

Q. Q. 87. Please refer to that instrument and to "Exhibit F drawing," and state of what material the upper plate marked E and the lower plate marked D are composed.

A. Of iron coated with tin, commonly known as tin.

Q. Q. 88. What is the material of the rod marked C?

A. Spring brass.

Q. Q. 89. Is that rod, or is it not, in electric contact with the lower plate D?

A. It is.

Q. Q. 90. Projecting up from the upper surface of the plate marked E, I observe a little object marked *e*, and stated in reference table to be wire to plate E. Is that wire in electric contact with plate E or not?

A. It is.

Q. Q. 91. In the "Exhibit reproduced F drawing," and in the instrument thereby represented, is the upper plate E electrically connected to the diaphragm C?

A. It is; by the bar or wire *e*.

Q. Q. 92. Is the carbon G electrically connected to the adjusting rods or posts F?

A. It is; through the metallic plate *d* and wire *d'*.

Q. Q. 93. State whether or not the diaphragm is in contact with either of the rods or posts F.

A. It is not; it has notches on its edges to allow the passage of said posts without contact.

Q. Q. 94. If there is an electric connection from the diaphragm to the posts F, please state what that electric connection is.

A. The only connection possible is through bar or wire *e*, plates E, *d*, carbon G, and wire *d'*.

Recess for dinner.

December 2, 1881, *at* 2 *o'clock*, P. M.

Examination resumed pursuant to adjournment.

Re-direct examination of Mr. Knight by Mr. Hill continued:

Q. Q. 95. Please look at the instrument "C," and at "Exhibit C drawing," and state what the base A of the instrument is made of.

A. Of wood—pine.

Q. Q. 96. And of what is the upright board B made?

A. Of pine wood.

Q. Q. 97. What are the braces C made of?

A. Of wood—black walnut.

Q. Q. 98. What is the body D made of?

A. Of wood—black walnut.

Q. Q. 99. What is the rim E made of?

A. Of wood—black walnut.

Q. Q. 100. What is the diaphragm G made of?

A. Of German silver, I think.

Q. Q. 101. What is the armature H made of?

A. Of soft iron.

Q. Q. 102. What is the band *g* made of?

A. Of iron tinned, commonly known as tin.

Q. Q. 103. Please look at the instrument "C reproduced," in connection with "Exhibit reproduced C drawing," and state whether the parts which are common both to "C" and "reproduced C," are respectively made of the same materials.

A. With the exception of the diaphragm they are; the diaphragm of "C reproduced" being tinned iron.

ELEPHONE COMPANY,-2

Q. Q. 104. The part marked F, in "Exhibit reproduced C drawing" and in the machine thereby represented, is the ordinary electro-magnet, is it not?

A. It is.

Q. Q. 105. And what is the part marked G?

A. A compound permanent magnet.

Q. Q. 106. What are the parts marked E and G′?

A. Wooden blocks to support magnets F and G.

Q. Q. 107. Is the permanent magnet attached to the machine, or simply laid on the blocks?

A. It is not attached. It is laid on the blocks.

Q. Q. 108. Please refer to the instrument "I" and to "Exhibit I drawing," and state what the body A, cap B, mouth-piece B′ and bottom cap C are made of.

A. Of wood; black walnut.

Q. Q. 109. The aperture C′ through the bottom cap C appears in the drawing to be a screw-hole. Is it so in the machine?

A. It is; a female screw.

Q. Q. 110. State whether or not the machine represented in "Exhibit reproduced I drawing, No. 1," which drawing is dated July 12th, 1881, is the identical original instrument "I" with the addition of mechanism placed within it?

A. It is; the wooden case is the same in both. So far as the case is concerned, it is a copy of the drawing of April 28th.

Q. Q. 111. Referring to the mechanism represented in said drawing of July 12th, what are the two diaphragms made of?

A. I think the upper of those diaphragms is of copper, if I remember rightly; the lower, of tinned iron. I will not be positive, however.

Q. Q. 112. Are they in contact, and if not, how are they separated?

A. They are not in contact, being separated by a paper ring marked e^3 in the drawings.

Q. Q. 113. The armature is attached to the lower diaphragm, is it not?

A. It is.

Q. Q. 114. What is the bar *d* made of?

A. It is made of iron.

Q. Q. 115. Can the poles of the electro-magnet be adjusted by the screw *e′*—I mean, can they be moved up and down?

AMERICAN BELL TEL

A. As shown in the instrument and drawings they cannot. That is to say, a piece of paper or other material would have to be placed under the heel-piece *d* in order to raise it, the screw being merely to hold the magnets in place in the box.

Q. Q. 116. Referring now to instrument "I reproduced" and to "Exhibit reproduced I drawing," No. 2, is the case of that instrument made of the same material as the case of the old instrument "I?"

A. It is.

Q. Q. 117. How many diaphragms has it?

A. One.

Q. Q. 118. What is that diaphragm made of?

A. Of iron tinned, commonly known as tin.

Q. Q. 119. How many permanent magnets are there in that instrument?

A. There are two, having their ends joined together. The ends are in actual contact—over-lapped, as shown in the cross-section—the ends being halved together and held to each other and to the electro-magnets by screws passing through the heel-piece and the ends of both magnets into the cores of the electro-magnet.

Q. Q. 120. Please look at the instrument "D" in connection with "Exhibit D drawing," and state what the several parts are made of in the original instrument before you.

A. The body A, cap B, mouth-piece B′, are made of black walnut wood. The diaphragm G is made of iron tinned, commonly known as tin. The flanges of the electro-magnet C are made of brass. The core of the electro-magnet *c* is made of iron and is hollow. The adjustable plug *c′* is made of iron. The adjusting screw F is of brass. The permanent magnet is of steel.

Q. Q. 121. Was there any bottom cap or cover on this instrument?

A. The body A of this instrument is rabbitted for such, but I have never seen such cover.

Q. Q. 122. What is the white patch shown in the front elevation of the drawing?

A. It is merely the effect of light and shadow on the drawing—in shading to bring out the curve of the mouth-piece.

Q. Q. 123. Is the white patch in the front elevation of "Exhibit E drawing" the same?

A. It is.

Q. Q. 124. Please examine the original instrument "E" in connection with "Exhibit E drawing," and state what the several parts are made of.

A. The body A, front cap B, and rear cap C are made of black walnut; the diaphragm D is of iron tinned, commonly known as tin; the side flanges of the electro-magnet E are of brass; the core G is of iron and hollow; the permanent magnet is of steel; the screw-plug G′, to support the magnet, is of iron, and is provided with a female screw H; the rear cap C is provided with an aperture *h* in line with the female screw H.

Q. Q. 125. When you made the drawing of instrument "E," I suppose you found in it no adjustable plug, corresponding to *c′* in "Exhibit D drawing," and no adjusting screw, corresponding to adjusting screw F in "Exhibit D drawing," did you?

A. I did not.

Q. Q. 126. Please examine the original instrument "H" in connection with the drawings marked "Exhibit H drawing, sheet 1," "Exhibit H drawing, sheet 2," and "Exhibit H drawing, sheet 3," and state what materials the several parts of the original machine are made of.

A. The body A, door B, bell-support C′, block G′, to support spring, portion of mouth-piece *b*, and insulator *g′* are of wood; also, the block *e*, through which passes a screw to retain bracket E in place; the bell C is of bell metal; the casting D to support diaphragm is of iron; the diaphragm F, of iron corrugated concentrically; rubber-ring, f; brass wire, f′, to hold diaphragm in place; bracket E, of brass, to support intermediate carbon-holding tube I′, which is of wood; plate D′ of brass to support contact-springs D^2, of brass, provided with carbon-holding cup d^2 of brass; adjusting screw H, brass; diaphragm-adjusting spring G, of iron; induction coil J of the usual construction; contact-spring K′, of brass; push-button K^2, of wood; contact-plate or anvil K, of brass; binding-posts K^3, of brass; plate to hold electro-magnets for bell L^3, of brass; post of same *l* and adjusting nut, of brass; armature M for bell magnets of iron; pivotal plate of armature and pivotal post *m* of brass; clapper-stem of bell, of brass; tension-spring *m′*, for armature M, of brass; cord N, made of cotton or hemp, to increase or diminish the strength or tension of spring *m′*; carbon-holding cup I, attached to diaphragm, is of brass, and is provided with a carbon ball I′; carbon cup d^2 also provided with a carbon ball d^3; between the end of the tension-spring G and the diaphragm is interposed a piece of rubber; the hinges connecting the door to the body of the instrument are, I think, of block tin, or some composition; the screws connecting the various parts are of iron; the strap *j*, holding the induction coil in place, is of brass; the plate D′ is insulated from ring D by a wooden insulator *g*′, and by vulcanite tubes g^3, and at the opposite end by a vulcanite tube or sleeve *h*, through which passes the adjusting screw H; the plate D′ is held or secured to a brass block projecting from the iron ring D by iron screws g^2, which pass through the vulcanite tubes or sleeves g^3 and into said projection.

Q. Q. 127. Is there any electric communication between the carbon-holder I^2 and the plate D′ except through the spring D^2 and the carbons?

A. There is not; the tube projecting outwards through an aperture in said plate, which aperture is at least twice the diameter of said tube and the tube being in the center of said aperture.

Q. Q. 128. In sheet 2 of said drawing, I observe what appear to be two holes through the wooden back of the instrument, one above and the other below the letter A. Am I correct in understanding them to represent holes?

A. Yes, sir; they are holes.

Q. Q. 129. Please examine the instrument "G" in connection with "Exhibit G drawing," and state what materials the several parts of said instrument are respectively composed of.

A. Body A, cap B, carbon-holding tube or cup F, are of wood—black walnut; the diaphragm C is of brass; adjusting-screw J, in rear of instrument, is of brass, and is hollow at its inner end, a rubber block I being placed in such hollow portion, said block projecting slightly beyond the end of the screw; the female screw through which the adjusting screw passes is of wood; the binding posts are of brass, one of said binding posts being connected by ordinary conducting wire to a contact plate or tip G′ at bottom of tube F; the other binding post is connected by a conducting wire to a short stud projecting from a contact plate G, which contact plate is placed within the mouth of the tube, and bears against the carbon balls or blocks within the tube F. The stem of the contact plate G at its outer end bears or impinges against a small contact cup *c* of brass, which is secured to the diaphragm. The contact plate G is of copper, coated with what appears to be platinum, upon its inner surface. The stem of said plate is of brass; paper ring D is placed between the diaphragm and the cover. The contact plate or tip G′ is of the same material as the plate or tip G.

Q. Q. 130. Please examine the original machine "O" in connection with "Exhibit O drawing," and state what materials the several parts of said machine are respectively composed of.

A. The body A, cap B, are of wood, as is also the ring G, in interior of the instrument. The adjusting screw I, in rear of instrument, is of brass, the front portion being hollow, and containing a brass spiral spring H′, which bears against the carbon-holding cup F, of brass, which cup contains a carbon ball *f*, and which cup is connected to one of the binding posts K, by an ordinary conducting wire.

The diaphragm C is of brass, and to its center is secured a carbon-holding cup *c*, of brass, containing a carbon ball *c′*. The diaphragm is connected to the remaining binding post by an ordinary conducting wire, the end of which wire is soldered to the diaphragm.

Q. Q. 131. I observe that the lower side of the longitudinal section in the drawing appears to have a recess, which is not shown at the upper side, and which seems to render the wall very thin at that part. Am I correct about that?

A. Yes, sir; it is so recessed.

Q. Q. 132. Do you remember how wide that recess is?

A. I think it was about three eighths of an inch wide, at its top.

Q. Q. 133. In this instrument, is not the cap B made with a slight annular concave between the opening of the mouth-piece and outer edge of the diaphragm?

A. It is.

Q. Q. 134. There is noted in the reference table of the drawing a card-board ring D; where was that placed in the machine?

A. Between the diaphragm and the cap, around the outer edges of the diaphragm. Its position is shown in the drawings.

Q. Q. 135. Please examine the instrument K, in connection with "Exhibit K drawing," and state of what materials the several parts of the original instrument are respectively composed.

A. Body A, front cap B, and rear cap C, friction roll H, and blocks F′, are of wood; the front diaphragm D, is of brass. The rear diaphragm is of iron coated with tin, commonly known as tin. The electro-magnets G are ordinary electro-magnets wound on wooden bobbins, and are connected to curved horse-shoe permanent magnets of steel F, which permanent magnets are held in place within the case or body of the instrument, by common wood-screws K, of brass, which pass through the side of the case between the legs of the permanent magnets

F, and into the wooden blocks F′. The permanent magnets are two in number, over-lapping at the poles, being halved together, and are secured to the electro-magnets by screws, which pass through such over-lapping portion into the cores of the electro-magnets. The armature E, of the electro-magnets, is of iron, the ends being connected to the upper and lower diaphragm, respectively, by brass plates, so that the armature stands perpendicular to the diaphragms. To the outer side of the armature is secured a brass plate E′, against which plate the friction roll H bears. The friction roll H is mounted upon a shaft *h*, of brass, which shaft projects through the side of the casing. The electro-magnets are connected to brass screw-cups arranged at opposite sides of the case.

Adjourned until December 3d, 1881, at 10 o'clock, A. M.

December 3d, 1881, 10 *o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs for respondents and Mr. Storrow for complainants.

Re-direct examination of W. H. H. Knight by Mr. Hill continued:

Q. Q. 136. Please examine original instrument marked "L," in connection with "Exhibit L drawing," and state of what materials the parts of the original instrument are respectively composed.

A. The body A, cap B, and wedges or blocks E′, are of wood; the wedges of pine, cap and body of black walnut. The instrument has a compound diaphragm consisting of two members, the one nearest the cap being made of copper; the other, of iron; the diaphragms are held together by a copper rivet *c*, through the center. A paper ring is interposed between the diaphragms at the outer edges. shown by the dotted lines. The upper diaphragm is perforated by four round holes, marked C^2. Two permanent horse-shoe magnets E, the poles of which are halved and over-lapped and are held together by screws which pass through said over-lapped portions, and into the cores of the electro-magnets D. The electro-magnets D are connected by ordinary conducting wires to binding posts F, arranged at opposite sides of the case or body. The permanent magnets are held in place, in the case or body, by wooden wedges E′, which are inserted between said magnets and the inside wall of the case. The inner surface of the cap B is provided with a recess, in which is placed a steel spring *b*, said spring being secured to the cap at its outer edge, near the flange of the said cap, by a rivet b^2. The opposite end of the spring extends to the center of the cap, terminating in the center of the mouth-piece aperture, where it is provided upon its outer surface, with a small circular block of brass *b′*, secured to said spring by a brass rivet. The spring *b* is regulated by an adjusting screw G, which passes through the cap and bears against the spring near its center, as shown in the drawing. This screw is an ordinary wood-screw.

Q. Q. 137. Please compare "reproduced L instrument" with "reproduced L drawing," and state the materials of which the several parts of the instrument are respectively composed.

A. The body A and cap B are of wood—black walnut; the wedges or blocks *f* are of pine wood; the carbon-holding tube G is of wood—maple, I think.

The instrument is provided with two curved, permanent horse-shoe magnets F, the poles of which are halved together over-lapping, and are secured or held together by screws *j′*, which pass through said over-lapped portions and into the cores of electro-magnets E.

The electro-magnets are connected by ordinary conducting wire at one side, to one of the binding posts, and at the other side to a metal plate, placed or attached to the inside bottom surface of the carbon-holding tube G.

Carbon balls *g* are placed in this tube, bearing upon said plate.

Upon the top of the carbon balls and within the tube, bears or rests a contact plate of copper, having an outwardly projecting stem of brass.

From this stem to the remaining binding post, extends an ordinary conducting wire.

An adjusting screw *h*, of brass, passes through the rear of the case or body, the forward portion of which screw is hollow and is provided with a rubber plug *h′*, which projects slightly beyond the end of the screw and bears against the lower end of the tube G.

The instrument is provided with a compound diaphragm D, consisting of two members held together at their centers by a brass rivet d^3. The outer diaphragm *d*, nearer the cap, is of copper, and is provided with four circular perforations.

The inner diaphragm *d′* is of iron. To the inner surface of the diaphragm *d′* is attached an armature *e*, of soft iron, which armature is held to the diaphragms by the same rivet that secures them together.

The armature is held at a slight distance from the diaphragm by a copper washer, which surrounds the rivet between the armature and the diaphragm. The end of this rivet d^3, below the armature, is slightly hollowed out.

The outer end of the stem of the upper contact plate in the tube G bears against the concave end of this rivet.

The inner surface of the cap B is provided, at one side, with a recess in which is placed a steel spring I, held or secured to the cap nearest its outer edge by a brass rivet; the opposite end of the spring extends to the central aperture in the cap, and is provided, upon its outer surface, with a small, thin, circular block *i*, of brass, attached to the spring by a brass rivet.

The spring I is regulated or adjusted by a screw *i'*, which passes through the cap, which screw is a common wood-screw of brass.

A paper ring d^2 is interposed between the diaphragms *v* surrounding said diaphragms at the edges.

A paper ring *j* is interposed between the upper diaphragm *d* and the cap B.

The tube G is held and guided within and by a tin tube H, which extends from the rear inner wall of the instrument to the outer ends of the electro-magnets, a slot being provided at one side of the tube H to allow passage for the conducting wire, the tube G being adjusted up or down in the tube H by the adjusting screw *h*.

Q. Q. 138. Please examine original instrument "M" in connection with "Exhibit M drawing," and state the material of which the several parts of the instrument are respectively composed.

A. The body A and cap B are of wood—black walnut. The instrument is provided with two curved, permanent horse-shoe magnets E, held within the case by screws *g'*. The poles of the magnets E are halved and over-lapped, such overlapping portions being held together and to the cores of the electro-magnets D by screws *e*.

Pieces of paper are interposed between the permanent magnets and the rear inner wall of the instrument. The rear wall of the instrument is perforated and is provided with a female screw-block or nut *g*, of brass, through which extends a brass post F.

The post F is provided at the part where it passes through the screw-block *g* with a male screw, which fits said female screw. The post F extends inwardly nearly to the diaphragm, between the electro-magnets and in line with their respective cores. The inner end of post F is hollowed out, said hollow portion being screw-threaded—a female screw. The diaphragm C is of iron, and bears or rests upon a rubber ring G, placed in a recess surrounding the inner wall of the case. The electro-magnets are connected by ordinary conducting wires to binding-posts *d*.

Q. Q. 139. Please examine reproduced instrument "M" in connection with "Exhibit reproduced M drawing," and state of what materials the several parts of the instrument are respectively composed.

A. The body A and cap B are of wood—black walnut. The instrument is provided with electro-magnets D, the heel-plate of which is secured to the rear inner wall of the instrument by screws, said heel-piece being provided at its center with an aperture.

An adjusting screw G, of brass, passes through the rear wall, at the center thereof, the stem of which screw is hollowed out, and is provided with a rubber block *g*, which projects slightly beyond the inner end of the screw.

The inner end of this rubber block bears against the lower end of a wooden carbon-holding tube E, placed between the electro-magnets in line with their respective cores.

The carbon-holding tube extends nearly to the outer end of the electro-magnets, and is provided, upon its lower inner surface, with a copper contact-plate *e'*; carbon balls *e* rest upon this plate within the tube, upon the upper of which rests or bears a contact-plate e^2, of copper, which plate is provided with an outwardly projecting stem of brass, the upper end of which bears against the concave end of the brass rivet securing the iron armature I to the diaphragm.

A thin copper washer is interposed between the armature and diaphragm. The diaphragm C is of tinned iron, commonly known as tin, and is connected to the armature at its center.

The instrument is provided with two binding-posts of brass, H, arranged at opposite sides thereof, to one of which one of the electro-magnets is connected by ordinary conducting wire. The remaining electro-magnet is connected by ordinary conducting wire to the lower contact-plate *e'* within the tube E.

The remaining binding post is connected by ordinary wire to the stem of the upper contact-plate e^2.

A paper ring is interposed between the diaphragm and cap.

The adjusting screw G moves through the aperture in the bell-piece or plate, to adjust the carbon-holding tube nearer to or farther from the armature of the diaphragm, as desired. The tube E is held and guided by tinned iron brackets *f*, between which the tube loosely slides. The brackets are secured to the heel-piece by the screws that fasten said heel-piece to the wall of the instrument.

Q. Q. 140. Please examine instrument "P" in connection with "Exhibit P drawing," and state the materials of which the several parts of the original instrument are respectively composed.

A. The back or base board A, block B for holding diaphragms, block E′ for holding induction coils, caps C, C′ of receiver and transmitter, mouth-piece D of transmitter and ear piece G of receiver, are of wood—black walnut.

The block B is held to the back or base board A by common wood-screws.

The rear surface of the block is recessed for a permanent horse-shoe magnet, such recess being shown at I in the drawings. At one end of this recess is a circular aperture I′. The rear surface of the block B is also provided with a recess, which extends from or about the middle of the lower edge, upward diagonally to a point at the heel end of recess I. The opposite or front surface of block B is provided with circular recesses M, as shown in the figure at lower right-hand corner of sheet 2.

Recess for dinner until 2 o'clock, P. M.

December 3, 1881, 2 *o'clock*, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Re-direct examination of W. H. H. Knight by Mr. Hill continued:

The recess M at right of lower right-hand figure is made to accommodate the diaphragm of the receiver, and the perforation I′ opens into said circular recess at the center thereof, it being a hole that goes entirely through the block. A portion of this recess M is somewhat deeper than the remaining part, such deeper portion forming a groove around the outer portion of the recess.

From this groove, at the upper portion of the block B, extends a perforation, which perforation passes through the block and to the upper leg of the recess I upon the back of said block.

The remaining circular recess M is provided with a similar groove at its outer edge, in which groove is placed a strip of soft rubber N, which extends nearly around the said groove, being held in place in said groove by small rubber blocks, as shown at lower right-hand corner of sheet 2, of the drawings.

The central portion of the latter circular recess "M" is somewhat deeper than the remaining portion of the recess, such deeper portion extending nearly to the back of block B, and into this deeper portion the diagonal recess upon the back of block B extends the terminal point of said diagonal recess being at the center of the deeper portion of recess M.

Upon the back of the block B and in the diagonal recess is pivoted a brass spring H′, the pivotal point of which spring is shown at h^2, at the upper right-hand corner of sheet 2. The spring H′ extends from the lower edge of the block to and enters the deeper portion of the recess M at its center. At this point a carbon-holding cup *h*, of brass, is secured to the spring by a brass rivet, said cup containing a carbon ball. The cup and ball project into the deeper portion of the circular recess M. Upon the inner rear wall of said deeper portion and above the carbon-holding cup of the spring, is secured a small wooden block, from which projects a small wooden post or stud. Upon this stud is hung a carbon block O, the outer surface of which impinges against a carbon ball held within a brass cup, attached by a brass rivet to the diaphragm of the transmitter.

This diaphragm is of tinned iron, commonly known as tin, and to its outer edge is secured by solder a copper wire, which passes through an aperture in the block rearwardly. The cap of the transmitter is provided upon its inner surface with a slight flange, which bears upon the outer edges of the diaphragm.

An aperture is made through the center of this cap, through which aperture projects outwardly a short copper tube, to the outer end of which is secured the wooden mouth-piece D; this cap is lettered upon the drawing C′, and is held in place by common wood-screws.

The remaining cap C is similar in form to cap C′, having a similar aperture at its center, and short outwardly projecting copper tube, into which, at its outer end, is inserted one end of a rubber tube F, through which tube extends from end to end an ordinary spiral spring, of brass, which spring projects into or through the copper tube upon the cap C; the opposite end of the rubber tube F is inserted into a copper tube extending from the rear surface of the ear-piece G.

The ear-piece G is made in two parts, to wit: A circular disc, forming the base and holding the tube, and a circular recessed and perforated piece forming the front portion of said ear-piece. The circular disc or base fits into the circular recess in the perforated front piece, and holds in place a small mica diaphragm in said circular recess.

Between the mica diaphragm and the circular disc is interposed a soft rubber ring, said ring surrounding the diaphragm at the outer edge thereof. Between the mica diaphragm and the lower surface of the circular recess is interposed a thin paper ring surrounding the outer edge of the diaphragm.

One end of the spiral spring presses lightly against this diaphragm.

The outer part or front of the ear-piece G is provided with a cup-shaped recess, from the base of which extends, to and into the circular recess, the perforation referred to.

Through the block B, between the caps C, C′ and nearly in line with their centers, (as shown on sheet 1 of the drawings), extends a perforation, which perforation passes to and into the recess I, upon the back of said block.

There is also an adjusting screw E, of brass, the stem of which passes through the block and impinges against the lower end of spring H′.

To the rear surface of the spring H′ is secured or attached by solder, one end of an ordinary conducting wire *h*′, which wire passes rearwardly through a perforation in the base-board A.

The block E′ is provided with circular recesses J, which recesses open upon the back of the base-board. These recesses are made for the purpose of containing or holding induction coils, one of which is shown in the drawing at K; *k* represents a wedge for holding said coil in place. H represents ordinary conducting wires, which extend from point to point in grooves made upon the back of the instrument. L represents apertures made through the base-board A for conducting wires.

The diaphragm of the transmitter was in the instrument, the diaphragm of the receiver was not when I made the drawings.

The carbon block O was also in the instrument. A portion of said block was broken off as indicated in the drawings. The above instrument will perhaps be better understood by reference to the reproduced instrument and the drawing thereof. I forgot to mention that in instrument "P" there is, upon the front side of the base-board A, between said base-board and block B, and opposite the spring H′, a recess not shown in the drawings. In this recess is placed a spring, of brass, one end of which is secured to the base-board A, the opposite end of which spring bears against the rear surface of spring H′, between the point at which the conducting wire is attached to said spring and its outer end. Such spring operates to keep the end of spring H′, bearing carbon cup *h* away from the other carbons contained in the circular recess. The spring mentioned is not shown in the drawings, but impinges against spring H′ at a point opposite, or nearly opposite, the adjusting-screw E, pressing the spring H′at all times against the point of the adjusting screw.

Q. Q. 141. Please examine "reproduced instrument P" in connection with "Exhibit reproduced P drawing," and state of what materials the several parts of the original instrument are respectively composed.

A. Back or base-board A, block holding diaphragms B, caps C D of transmitter and receiver, mouth-piece C′ of the transmitter and block L, for holding induction coils, are of wood—black walnut.

The blocks B and L are secured to the base-board A by ordinary wood-screws of iron.

In the rear surface of block B is a recess K^2, in which recess is placed a permanent steel horse-shoe magnet I′, to one of the poles of which is attached, by an iron screw, an electro-magnet, I, which electro-magnet extends through an aperture in the block B. To the remaining pole of the permanent magnet is secured, by a screw, a post J, which appears to be of steel. This post also extends through block B, through an aperture near its upper edge.

The permanent magnet I′ is compound, consisting of two members held together by brass rivets.

The magnet is held in place in the recess by a common wood-screw *i*, which passes through the upper leg of said magnet and into the block B.

There is also another recess upon the rear surface of block B, which recess extends diagonally upward from a point near the middle of the lower edge of block B, to a point at the heel of the recess K^2.

In this diagonal recess is placed a brass spring G′, pivoted to the block at the point *g*′, and provided, upon its rear surface, with a conducting wire G^3, which wire is soldered to the spring G′ at one end.

The upper end of the spring G′ passes under the horse-shoe magnet, and is provided at its end with a brass carbon-holding cup G^2, in which is secured a carbon ball G^4.

Said carbon cup and ball project inwardly into a circular recess F, shown in the drawings, [sheet 2.]

The front side of the block B is provided at each end with circular recesses for the accommodation of the diaphragms of the transmitter and receiver respectively.

The recess shown at the right of "front view" [sheet 2] is provided with an annular groove at its outer edge, somewhat deeper than the remaining portion of the recess, in which groove is placed a rubber ring H′, held in place by small wooden blocks *h*.

The electro-magnet I, attached to the lower pole of the permanent magnet I′, extends to and into the circular recess near the center thereof.

The post J, attached to the upper pole of the permanent magnet I′, extends to and into this recess at its upper portion, said post being provided at this point with a female screw, into which fits a corresponding male screw, of iron, that passes through the diaphragm near its outer edge, securing said diaphragm H to the post.

The diaphragm H of receiver is of tinned iron, commonly called tin, and bears at its inside edges upon the rubber ring H′.

The outer end of the pole of electro-magnet I terminates a slight distance from the inner surface of the diaphragm H, and at the center thereof.

The circular recess F, for the accommodation of the transmitting diaphragm, is provided at its outer edges with a groove in which is placed a rubber ring G, that extends nearly around said recess.

Adjourned until Monday, December 5th, 1881, at 10 oclock, A. M.

Monday, December 5th, 1881.

Examination resumed pursuant to adjournment.

Present Mr. Storrow for complainants, and Mr. Hill for respondents.

Re-direct examination of Mr. Knight by Mr. Hill continued:

[*Answer resumed.*]

In the circular recess F, directly above the carbon-holding cup g^2, secured to the rear inside wall of said recess, is a small wooden block, provided at its lower end with a wooden post or stud *f*′, upon which is hung a cardon block *f*, against the rear surface of which block the carbon ball G^4, attached to the spring G′, impinges.

The opposite side of the block *f* impinges against a carbon ball *e*′, placed in a carbon-holding cup *e*, of brass, secured to the diaphragm by a brass rivet, said cup and carbon ball being shown in position upon the diaphragm in sheet 3 of drawings. I did not think it necessary to show the diaphragms in the sectional views in sheet 2.

This diaphragm E is of tinned iron, commonly known as tin, and is provided at its lower outer edge with an ordinary conducting wire g^2, which wire is attached to the diaphragm at one end by solder, and which wire passes rearwardly through the block B and base A of the machine.

The carbon-holding end of spring G′ and carbon block *f* are adjusted nearer to or farther from the diaphragm by an adjusting-screw K′, of brass, the stem of which passes through block B, near its lower edge, and impinges against one side of the spring G′ at its lower end.

The spring G′ is kept pressed against the point of the adjusting-screw K′ by an ordinary leaf spring of brass, held at one end to its base A in a recess upon said base or back, between the block B and the recess, and at the lower edge of said block. The outer end of this spring bears against the spring G′, upon the side opposite to that impinged upon by the adjusting-screw, and at a point directly opposite the end of said screw, its purpose, as above stated, being to keep the end of the spring G′ at all times pressed against the point of the adjusting-screw.

An adjusting screw K, of brass, passes through the block B from front to rear, the point of which screw bears against the lower leg of the permanent magnet I′, for the purpose of adjusting the electro-magnet I, secured to the pole of said lower leg, nearer to or farther from the diaphragm H of the receiver.

This diaphragm H is of tinned iron, commonly known as tin, and is secured at its upper edge to the post J, (the other end of which is connected to the upper leg of the permanent magnet I′,) by a common iron machine screw.

The cap C of the transmitter is of black walnut, and is provided upon its inner surface with a slight flange, which bears upon the outer edges of diaphragm E, when said diaphragm is in place in the instrument.

The cap C is provided at its center with an aperture, from the inner edge of which projects outwardly a brass tube C^2, about one and one half inches in length.

To the outer end of this tube is secured a wooden mouth-piece C', the outer surface of which mouth-piece has a cup-shaped recess, and which mouth-piece is also perforated at its center.

The cap D of the receiver is of black walnut and is provided upon its inner surface with a flange, similar to the flange of cap C, and which bears upon the outer edge of diaphragm H of the receiver.

The cap D is also provided at its center with an aperture, through which projects, from the inner surface of said cap, and outwardly, a brass tube D', about one inch and a half in length, in the outer end of which tube is inserted a rubber tube D^2. The outer end of this tube is inserted in one end of a brass tube connected at its opposite end to a wooden ear-piece.

This ear-piece is not shown in the drawing, but is similar in all respects to the ear-piece shown and described in connection with instrument P, having a mica diaphragm, rubber and paper rings, cup-shaped recess for the ear, etc.

In this instrument, as in the original instrument P, a spiral spring D^3, of brass, extends from end to end of tube D^2 inside of said tube, the ends of which spring bear upon the respective diaphragms of the ear-piece and receiver.

The block L, for holding induction coils, is of black walnut, secured to the base-plate A by ordinary wood-screws.

This block is provided with circular recesses L', which open through the back of the plate A.

The recesses L' are made for the purpose of holding induction coils L^2, which are common induction coils, and are held in place in said recesses by wooden wedges l.

Apertures l^5 are provided, through the base-plate A, for the passage of conducting wires l' from point to point, which wires are held in grooves made upon the back of base-plate A by pieces of paper l^2, pasted over said grooves and wires.

The screws marked l^3, l^4, are common wood-screws, and hold in place the blocks B and L upon the face of base A.

Upon the face of base A, between base A and block B, and opposite the permanent magnet upon the block, is a recess to accommodate the permanent magnet.

The instrument is evidently intended to be used with the base-plate

TELEPHONE COMPANY,-2

A in a vertical position, and I have so described it. The base-plate A has a perforation near its upper end, by means of which it may be hung upon or secured to a wall.

Near the right edge of base-plate A is a perforation for the accommodation of a switch, as I have been told by Mr. Drawbaugh.

The spring D^3 in "Exhibit reproduced P drawing, sheet 1," shown in the rubber tube of "Reproduced P," is drawn from the spring in the rubber tube attached to original instrument "P." In making "Exhibit P drawing," I intended to have shown the tube cut open, in order to exhibit the spring, but inadvertently omitted to do so.

While I was making "Reproduced P drawing," I noticed this omission, and, as Mr. Drawbaugh informed me that the rubber tube and spring to be attached to the "Reproduced P" would be precisely similar to the spring and tube attached to original instrument "P," I thought such spring need only be shown in the drawings of the reproduced instrument, and therefore did not correct the drawings of the original instrument in that respect. The tube now on the reproduced instrument has no spring in it.

Q. Q. 142. On comparing the original instrument "P" with the "Reproduced instrument P," I observed that the former has evidently been, accidentally or otherwise, deprived of a few parts shown in the latter. Will you please explain what these parts are, and whether the original instrument, so far as you can judge from its construction and present appearance, contained them at some former time?

A. "Reproduced instrument P" is provided with a permanent magnet and also with an electro-magnet and with post J, which are all wanting in the original instrument, but for which places are provided in the original instrument.

The original instrument "P" also lacks the diaphragm of receiver and rubber ring upon which said diaphragm rests, said diaphragm and ring being attached to instrument "Reproduced P."

The original instrument, however, is provided with places for the reception of said missing parts.

The adjusting-screw for the permanent magnet, shown in "Reproduced P drawing," and lettered K, is missing from original instrument "P," in which latter instrument, however, an aperture is provided for the passage of such a screw.

The pivoted carbon block, shown in "Reproduced P drawing," and marked *f*, is at this time wanting in original instrument P, but when I made the drawings of the original instrument, a portion of this block was in place in the instrument, in the position shown at lower right-hand corner of sheet 2 of "Exhibit P drawing," and lettered O in said drawing.

The recess contained in the base A of reproduced instrument P, for the accommodation of the permanent magnet, is not shown or contained in the original instrument. Its place is supplied by depressions or cut away portions in said base A.

The reproduced instrument is provided with two induction coils. The original instrument has one.

There are also fewer conducting wires in the original than in the reproduced instrument. The rubber tube upon the reproduced instrument lacks the spiral spring contained in the corresponding tube of the original, and said tube is a little over half as long as the tube of the original pin.

Q. Q. 143 Was the pivoted carbon block of original and reproduced instrument "P" capable of a free sliding movement lengthwise of its supporting pin?

A. It was, the aperture through said block being somewhat larger than the diameter of said pin, as indicated by the dark space surrounding said pin, in the drawings of the original instrument, sheet 2.

Q. Q. 144. Then, in consequence of that large aperture, said carbon block was not only capable of swinging on said pin as its axis, but also capable of a slight rocking movement on an imaginary axis transverse to the pin. Was it?

A. It was capable of both such motions or movements.

Recess until 2 o'clock, P. M., for dinner.

December 5, 1881, 2 *o'clock*, P. M.

Examination resumed pursuant to adjournment.

Present same counsel, with the addition of Mr. Jacobs for respondents.

Re-direct examination of Mr. W. H. H. Knight by Mr. Hill continued:

Q. Q. 145. Please examine instrument "Q" in connection with "Exhibit Q drawing," and state the materials of which the several parts of the original instrument are respectively composed.

A. The body A, cap B, movable mouth-piece B′ and rear cap C are of wood—black walnut.

The mouth-piece B′ is provided with a shoulder that bears upon the face of the cap B, and with a projecting portion that fits closely into a circular aperture made through said cap.

The mouth-piece B′ is provided with a cup-shaped recess upon its front side, and an aperture through said mouth-piece at the base of said recess.

The body A has recesses in its front and rear surfaces; one of which—the front—has the outer portion of its surface deeper than the remaining portion, said deeper portion forming a groove around said recess, as shown in the drawings at the upper right-hand corner.

In this deeper portion is placed a ring of soft rubber, the upper edge of which projects upward beyond the surface of said recess and forms a rest for the diaphragm D.

The diaphragm is of iron and is partially divided and provided at its center with a circular aperture, as shown in the drawings at lower right-hand corner.

The recess in rear side of body A is uniform in depth.

In this recess are placed two compound permanent horse-shoe magnets G, the poles of which over-lap (north to north and south to south) and are held together and to electro-magnets F by iron screws that pass through the over-lapped portions and into the cores of the electro-magnets.

The permanent magnets are held in position in the recess by common wood-screws.

The electro-magnets project through perforations in the body A, their poles nearly touching the under surface of the diaphragm.

The electro-magnets are connected by ordinary conducting wires with two small binding posts I, of brass, arranged at one side of the instrument, within the rear recess.

Through the flange of the instrument, opposite the binding-posts, are provided apertures through which pass ordinary conducting wires.

Pieces of paper *g* are laid over the conducting wires in the recess between said conducting wires and the permanent magnet.

The rear cap C is perforated at its center.

Q. Q. 146. Please examine instrument "N" in connection with "Exhibit N drawing," and state the materials of which the several parts of the original instrument are respectively composed.

made the drawings of the original instrument, a portion of this block was in place in the instrument, in the position shown at lower right-hand corner of sheet 2 of "Exhibit P drawing," and lettered O in said drawing.

The recess contained in the base A of reproduced instrument P, for the accommodation of the permanent magnet, is not shown or contained in the original instrument. Its place is supplied by depressions or cut away portions in said base A.

The reproduced instrument is provided with two induction coils. The original instrument has one.

There are also fewer conducting wires in the original than in the reproduced instrument. The rubber tube upon the reproduced instrument lacks the spiral spring contained in the corresponding tube of the original, and said tube is a little over half as long as the tube of the original pin.

Q. Q. 143 Was the pivoted carbon block of original and reproduced instrument "P" capable of a free sliding movement lengthwise of its supporting pin?

Q. Q. 144. Then, in consequence of that large aperture, said carbon block was not only capable of swinging on said pin as its axis, but also capable of a slight rocking movement on an imaginary axis transverse to the pin. Was it?

A. It was capable of both such motions or movements.

Recess until 2 o'clock, P. M., for dinner.

December 5, 1881, 2 *o'clock*, P. M.

Examination resumed pursuant to adjournment.

Present same counsel, with the addition of Mr. Jacobs for respondents.

Re-direct examination of Mr. W. H. H. Knight by Mr. Hill continued:

Q. Q. 145. Please examine instrument "Q" in connection with "Exhibit Q drawing," and state the materials of which the several parts of the original instrument are respectively composed.

A. The body A, cap B, movable mouth-piece B′ and rear cap C are of wood—black walnut.

The mouth-piece B′ is provided with a shoulder that bears upon the face of the cap B, and with a projecting portion that fits closely into a circular aperture made through said cap.

The mouth-piece B′ is provided with a cup-shaped recess upon its front side, and an aperture through said mouth-piece at the base of said recess.

The body A has recesses in its front and rear surfaces; one of which—the front—has the outer portion of its surface deeper than the remaining portion, said deeper portion forming a groove around said recess, as shown in the drawings at the upper right-hand corner.

In this deeper portion is placed a ring of soft rubber, the upper edge of which projects upward beyond the surface of said recess and forms a rest for the diaphragm D.

The diaphragm is of iron and is partially divided and provided at its center with a circular aperture, as shown in the drawings at lower right-hand corner.

The recess in rear side of body A is uniform in depth.

In this recess are placed two compound permanent horse-shoe magnets G, the poles of which over-lap (north to north and south to south) and are held together and to electro-magnets F by iron screws that pass through the over-lapped portions and into the cores of the electro-magnets.

The permanent magnets are held in position in the recess by common wood-screws.

The electro-magnets project through perforations in the body A, their poles nearly touching the under surface of the diaphragm.

The electro-magnets are connected by ordinary conducting wires with two small binding posts I, of brass, arranged at one side of the instrument, within the rear recess.

Through the flange of the instrument, opposite the binding-posts, are provided apertures through which pass ordinary conducting wires.

Pieces of paper *g* are laid over the conducting wires in the recess between said conducting wires and the permanent magnet.

The rear cap C is perforated at its center.

Q. Q. 146. Please examine instrument "N" in connection with "Exhibit N drawing," and state the materials of which the several parts of the original instrument are respectively composed.

A. The body A, front cap B, rear cap C, and disc M, are of wood—black walnut.

The front portion of body A has a circular recess in it. The outer edges of said recess are slightly deeper than the remaining position, as shown in front view of body of instrument.

In this deeper portion rests a rubber ring F, inclosing a plaster-of-Paris disc F, said disc being cracked, as shown in front elevation of body.

A paper ring I is laid upon the upper surface of the rubber ring, upon which ring I rests a two-part diaphragm of steel G—two semicircles. A paper ring H is laid upon and surrounds the outer edge of this diaphragm, and upon this latter ring is laid a wooden disc M, the center of which is perforated, and which has also upon its front surface a slight recess that extends from its outer edge to such perforation.

The rear portion of the body A of the instrument is provided with a circular recess, the central portion of which is somewhat deeper than the remaining part of said recess. A portion of the flange surrounding this recess is broken away, as indicated by the drawings.

In this recess, and secured to the body of the instrument by common iron screws, are placed two compound permanent horse-shoe magnets E, the poles of which over-lap [north to north and south to south] and are held together and to electro-magnets D by common iron screws, that pass through said over-lapped portions and into the cores of the electro-magnets. The magnets D pass through perforations in the body A and plaster-of-Paris disc F, the poles of said magnets nearly touching the steel diaphragm.

The electro-magnets are connected by ordinary conducting wires, with small brass binding posts O, arranged at each side of the instrument, within the rear recess.

These binding posts are provided with conducting wires K, that pass outwardly through the flange surrounding said recess.

Pieces of paper are laid between the permanent magnets and conducting wires, as shown in the drawings.

The inside of the cap B is provided with a recess extending from one edge of said cap to a perforation made in its center, in which recess is laid a brass spring L, the outer end of which spring is secured to the cap by a brass rivet.

The inner end of the spring, opposite the aperture, is provided with a small circular brass block, held to the spring by an iron screw.

This block is upon the inner surface of the spring, and passes through the aperture in the wooden disc M, to the diaphragm. Through the cap B passes an adjusting-screw *l* of iron, the point of which impinges upon or against the spring L.

The cap B is held in position upon the instrument by common wood-screws of brass.

The rear cap C is perforated at its center, over which perforation, at the time the drawings were made, was pasted a piece of paper *c*.

The conductors K referred to are flexible cords, consisting of a number of fine wires covered with braided silk. One of these is green and the other red. They have conducting tips of copper wire.

Q. Q. 147. Please examine instrument "J" in connection with "Exhibit J drawing," and state the materials of which the several parts of the original instrument are respectively composed.

A. The body of the box A, door B, mouth-piece B^1, B^2, disc B^3, are of wood—black walnut. The back of the box is of pine wood. The mouth-piece is made of two pieces, one of which B^2 fits into a perforation in the door, with the sides of which it is flush. The other, at the time the drawings were made, was glued to the outside surface of the door surrounding this aperture.

To the inner surface of the door B is secured, by common wood-screws, *c*, an iron casting C. This casting is nearly an ellipsoidal ring, being in the shape of two half circles, drawn apart, with the ends being continued in straight lines until they meet. The upper part of this casting is provided with an upward and outward projection, which projection is cast with the ring C, and projects inward, into the body of the box, when the door is closed.

The lower part of the ring C is also provided with a projecting portion, perforated and provided with female screws.

This ring is rabbitted on its inside so as to leave a flange C' next to the door, upon which flange rests the diaphragm G, of iron or steel. Between said diaphragm and the door, within the space inclosed by the flange C', is a wooden disc B^3 secured to the door by brads. This disc is a re-inforcement of the door and is covered with shellac. It has no vibrating function, but is held rigid against the door, the mouth-piece opening through it.

Diaphragm G is surrounded at its edges with a piece of paper *g*, said paper strip being interposed between the diaphragm and the flange C' of the casting C, and also between the diaphragm and a ring of brass wire F which rests upon the edges of the diaphragm, opposite the flange, and serves to hold the diaphragm in place upon said flange, being itself held in place by iron machine screws *f*, which pass into the casting C.

Near the center of the diaphragm, upon its inner side, furthest from the mouth-piece, are secured two carbon-holding cups of brass, O, O^2, one of which O is attached directly to the diaphragm by a brass rivet, the other O^2 being attached by a copper rivet to an insulating plate O' of vulcanite or hard rubber, said insulating plate being in turn secured to the diaphragm by four small copper rivets.

Each of the carbon-holding cups, O and O^2, contains a carbon ball, marked o, o' respectively.

From the insulated carbon-holding cup O^2 extends a conducting wire.

To the diaphragm below said cup is also soldered a conducting wire at P.

Attached by screws d^2 to the upper outward and upward projecting portion of casting C are two brass plates D, which are insulated from the projection on the casting by an interposed thin piece of wood D^2, and are further insulated from the screws d^2 by vulcanite sleeves; said sleeves being shown in right-hand figure of sheet 2, between the screw-head and the plate.

Attached to the plates D by iron screws d' are two leaf springs D', to the lower free ends of which, upon the side nearest the diaphragm, are attached by iron screws d^4, brass carbon-holding cups d^5, containing carbon balls d^6.

The plates D are curved laterally, to allow spaces D° through which the carbon-holding cups d^5 project.

The lower ends of the plates D are perforated, and provided with brass adjusting screws d, the stems of which screws project through the perforations and into the female screws at lower portion of casting C.

The adjusting-screws d are insulated from the plate D by a vulcanite plate and sleeve d°.

Attached by screws e to the ring C, and at each side thereof, are thin brass plates or brackets E that extend inwardly nearly to the center of the diaphragm, and are provided at their inward ends with perforations, which carry carbon-holding tubes E' of wood—apparently maple The bores of these tubes are in line with the carbon-holding cups d^5 upon the springs D', and the carbon-holding cups O, O^2, upon the diaphragm respectively.

From the appearance of the bores of these tubes, I should judge that carbon balls have been placed or used in them, and I have so indicated such balls by dotted lines, at figure right side of sheet 2.

Pivoted to the upper ends of each of the plates D are switch plates D^3, the outer ends of which may be swung to and upon the upper ends of two conducting posts of brass D^4, projecting from the inside surface of the door, as shown at right of figure in drawing, sheet 2, and also in sheet 1, and also may be swung together; one of these posts is connected by ordinary wire to the upper hinge *b* of the door B, which hinge is also connected by conducting wire to fastening plates, *n n'* held together and upon the end of the wire by a screw n^2—a sort of binding post.

These plates, or binding post, are connected by an ordinary conducting wire, to the insulated carbon-holding cup O^2 upon the diaphragm.

The diaphragm is connected with the lower hinge, *b*, of the door, by an ordinary conducting wire, which is soldered to the diaphragm at P. The remaining post D^4 is connected by an ordinary conducting wire to one of two switch plates, J', attached to the inside surface of the bottom of the box.

A piece of paper *m* is placed over the conducting wire upon the inside of the door, said piece of paper being held in place by a tack *m'*.

The switch plate J', which is nearest to the lower left-hand corner of the plan of the bottom, in sheet 2, is connected to D^4 by the wire already mentioned, and is also connected by a switch J with another switch plate, to which latter the switch is pivoted by an iron screw *j*, which passes through both switch and plate and into the bottom of the box.

The switch and plates referred to above are shown at the left of bottom plan view, sheet 2, of the drawings.

To the bottom of the box, at the right side of the figure last referred to, are similar switch plates J' and switch J, one of which plates—the one to which the latter switch is pivoted—is connected by an ordinary conducting wire to the right hand one of two induction coils H, held in place against the back of the box, near its bottom, by straps *h*, of tinned iron, commonly known as tin, and brads *h'*, which pass through said straps and into the wood of the box.

The point of connection is marked CP on the coil of the machine.

Adjourned until Tuesday, December 6, at 10 o'clock, A. M.

December 6, 1881, 10 *o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present same counsel as yesterday.

Re-direct examination of W. H. H. Knight by Mr. Hill continued:

[*Witness continues.*]

The induction coil H referred to is connected to the bottom hinge *b* of the box by an ordinary conducting wire. The point where this wire leaves the coil is marked ZP in the instrument.

This coil is also connected by an ordinary conducting wire, with the left hand one of the two central switch plates lettered i', of brass.

Pivoted upon and in contact with this switch plate is a brass switch I'. The pivotal screw i^2 is of iron and passes through said switch and plate and into the back of the instrument.

The remaining central switch plate i', to the right of the switch plate last mentioned, is of brass and similar in form to the switch plate described, and is provided with a similar switch I', of brass, and pivotal screw i^2, of iron.

A small piece of copper wire is connected to the switch plate, and is not connected to anything else.

The outer ends of the two switches I' may be swung into contact, as shown in the drawings, or may be swung into contact with contact plates I^2, of brass, arranged upon the back of the instrument, as shown in the drawings, sheet 1.

The contact plates I^2 are held to the back of the instrument by small iron screws, and are provided at their lower edges with beveled portions i^3.

One of these contact plates—the one at the right of the instrument—is connected by an ordinary conducting wire, with a binding post upon the top of the instrument, at the right side thereof, as shown in sheet 1 of the drawings.

The remaining contact plate I^2 is also connected with a similar binding post upon the top of the instrument, at the left side thereof.

The binding posts referred to are of brass, and lettered L in the drawings, as are all the binding posts upon the instrument.

The right side of the body of the instrument is provided, near its top, with two binding posts, (as shown in the drawings, in the figure at left hand of sheet 2,) one of which holds in place a switch K, of brass, provided, at it lower end, with a wooden handle *k*.

Through the side of the box, at a point beneath the lower end *k*, of the switch last mentioned, extends a brass plug, the ends of which project slightly beyond the inner and outer surfaces of the side referred to. The switch last mentioned may be swung into or out of contact with the outer end of this plug. The inner end of this plug is connected by an ordinary conducting wire, with one of the switch plates upon the bottom of the instrument, inside (the one at lower right-hand corner of bottom plan, sheet 2.)

There is also another switch K, of brass, upon the outer surface of the right side (shown in "Elevation of right side," at left-hand side of sheet 2 of drawings, and also shown in sheet 1) of the instrument.

The upper end of this switch is pivoted by a brass screw k' to the side of the instrument, the inner end of which screw projects slightly beyond the inner surface of the side of the instrument, and is connected by an ordinary conducting wire with one of the two binding posts L referred to—the one nearest the back.

The lower end of the switch K last referred to is provided with a wooden handle *k*.

Through the side of the box, at a point directly opposite or beneath such handle, extends a brass post, the ends of which project slightly beyond the inner and outer surfaces of the side.

The switch last referred to may be swung into contact or against the outer end of this post. The inner end of the post is connected by an ordinary conducting wire with the induction coil at left of instrument.

The opposite left-hand side of instrument is also provided, near its top and upon its outer surface, with two binding posts, similar to those described, the screws or inner ends of which project slightly beyond the inner surface of the side, and are each connected by an ordinary wire with the upper hinge *b* of the box. Between these two posts on the outside of the instrument the letter "Z" is marked, and between the two corresponding posts on the right side of the instrument the letter "C" is marked.

Upon the back of the instrument, inside, and at the right and left of the switches I' respectively, are two switches I, of brass, pivoted at their lower ends by iron screws i^2 to switch plates *i*. The screws i^2 serve to hold both switches and plates in position upon the back of the box.

The upper free end of the switches I may be swung into contact with the contact plates I^2.

The lower end of one of the switch plates *i* (the one at the right of sheet 1) is connected by an ordinary conducting wire with the induction coil at right side of instrument, at the place marked "Z S" on the instrument.

The remaining switch plate *i* is provided with a short piece of ordinary copper connecting wire.

The induction coil at left of instrument is provided with three more conducting wires, the ends of which are not connected with any part of the instrument. One of these wires referred to is not shown in the drawings, having been inadvertently omitted.

The back of the instrument is split or cracked from top to bottom, said split being shown in the drawings, sheet 1, and marked "split."

Q. Q. 148. Referring to the wires which form the several electric connections within the instrument, state whether you have, at any time, while making the drawings or since, broken or disconnected any of said wires.

A. I have; the wire extending from the diaphragm at P to the lower hinge I disconnected from the hinge, in order to draw the diaphragm. This was after I had drawn sheet 1.

At the time, or just before drawing this instrument, I accidentally broke some of the connections within the body of the instrument. I do not exactly remember which.

Q. Q. 149. State whether you have taken nearly all of these instruments apart here, during your examination as a witness.

A. I have.

Q. Q. 150 Referring to "Exhibit M drawing," I find a note thereon stating that at one time the diaphragm of this instrument was made of tin, and was rigidly attached to the post F, by a screw which entered the recess *f*, in the post F. Did you make that statement from your own knowledge or from hearsay?

A. When making this drawing, I noticed the recess referred to in the end of the post, and asked Mr. Drawbaugh its purpose. The answer he gave me was, in substance, the same as the note I have placed upon the drawing.

Q. Q. 150½. I find in "Exhibit C drawing" a note stating that a second or auxiliary diaphragm, of gold-beater's skin, was originally used in this instrument; said diaphragm being held in place by the ring E. Do you know personally or only from hearsay that said diaphragm was originally used?

A. I noticed a fragment apparently, of paper or bladder, surround-

LEPHONE COMPANY,-2

ing the instrument, when I was making the drawing. I inquired of Mr. Drawbaugh what it was, and was told that it was gold-beater's skin, as I have stated in my note, and that it had originally formed the diaphragm.

Recess for dinner until 2, P. M.

December 6, 1881, 2 *o'clock*, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Re-direct examination of W. H. H. Knight by Mr. Hill continued:

Q. Q. 151. Referring to "Exhibit reproduced I drawing, No. 1," I find thereon a note stating that "The above view shows the instrument provided with two diaphragms, as used in one form, the upper of the two diaphragms being perforated as shown." Was that statement made from personal knowledge or from hearsay ?

A. The note is in substance what I was told by Mr. Drawbaugh at the time I was drawing this instrument.

Q. Q. 152. I find on "Exhibit reproduced L drawing," a note to the effect that "The above drawings show one of the original forms of instrument 'L.'" Was that statement made of your own knowledge ?

A. It was not. Mr. Drawbaugh told me that several instruments had been made similar in many respects to L, and that the instrument, of which the figures referred to are drawings, was similar in form to one of said instruments.

Q. Q. 153. I find on "Exhibit reproduced M drawing," a statement that "The above drawings show the original form of instrument 'M.'" Was that statement made of your own personal knowledge ?

A. It was not. I was informed by Mr. Drawbaugh that the instrument from which the drawings referred to were made was in form similar to the original instrument "M."

[*Complainants' counsel objects to each and all of the notes made by the witness on the drawings, and quoted in interrogatories* 150–153, *and asks that they be stricken from the record.*]

Q. Q. 154. State whether you have had opportunity to observe and know whether Mr. Daniel Drawbaugh, in ordinary conversation, and in his attempts at orally describing mechanical devices, exhibits much or little facility of expression, and much or little power to describe mechanical devices, so as to make himself clearly understood by others?

[*Question objected to by Mr. Storrow.*]

A. I have known Mr. Drawbaugh since the spring of 1880, since which time I have met him at various places, have been at his shop and house, and have spent a great deal of time in his society. I have heard him during such times explain, or attempt to explain, various mechanical devices, and have noticed that such explanations were not clearly made, inasmuch as while he evidently thoroughly understood what he was speaking of, yet he could give no perfect expression to his thoughts. Apparently his ideas came faster than he could find words to express himself. This caused him to jump suddenly from one to another part of his description. Close attention to his description and frequent questioning are necessary, in order to thoroughly understand what he is trying to describe. This has been the case whenever he has tried to give me a description of any mechanical device, which he has done several times and about various machines for different purposes.

Q. Q. 155. And is this as true of his attempted descriptions of other mechanical devices as of telephones?

A. It is.

Re-cross-examination by Mr. Storrow:

Re-cross-Q. 156. When did you first see Drawbaugh?

A. At some time in the early spring of 1880, I think.

Re-cross-Q. 157. Where?

A. At Washington.

Re-cross-Q. 158. Where, in Washington?

A. At the office of L. Hill, Esq., 617 Seventh street.

Re-cross-Q. 159. How did you happen to be at that office?

A. I occupied desk-room there as a draughtsman.

Re-cross-Q. 160. Did you have any conversation there then with Drawbaugh about any machines he had constructed or devised?

A. I did.

Re-cross-Q. 161. Did he have with him at that time any of the instruments about which you have testified?

A. I think not; I think it was later that I first saw those instruments—about June or July, to the best of my knowledge.

Re-cross-Q. 162. How much time elapsed between those two visits, as near as you can recollect?

A. I cannot now say. We were accustomed to having strangers come and go at all times, which being the case, I did not charge my mind with the visit of any particular one, as is true of to-day.

Re-cross-Q. 163. Did you have any conversation with him about telephones the first time you saw him there?

A. I do not remember having had any conversation with him about telephones, particularly at that time.

Re-cross-Q. 164. Whom did you see with him at that time?

A. I do not remember who; there was some one, I think, came to the office with him, but who, I cannot say.

Re-cross-Q. 165. I understand from your testimony that you began to make these drawings at Harrisburg, in the latter part of April, 1881, and continued at work upon them at Harrisburg until some time in August, 1881. Is that the case?

A. Nearly all this time; part of this time, however, I was at Washington, New York, Boston, and other cities.

Re-cross-Q. 166. While you were making these drawings in Harrisburg, did you see much of Mr. Drawbaugh?

A. Almost every day I saw him.

Re-cross-Q. 167. What has been the nature of your occupation for the last ten years?

A. Ten years ago I was employed by the United States Engineer Corps, on the military works in Boston harbor, at which time I had charge of the wood-working division, and at one time I had general oversight of the work at the place where I was stationed. Since that time I have been engaged, at various times, in mechanical occupations, both in wood and metal, having had charge of work in both branches. For the past three or more years I have confined myself to mechanical drawing, both designing machinery, working drawings, and Patent Office drawings—more particularly Patent Office drawings.

About the time I first went to Washington I was in the United States Patent Office as a machinist, doing the repairing of the damaged models. While there I had from two to four assistants during the entire time. My work consisted of repairing such models, which repairing was done from the drawings.

Re-cross-Q. 168. Do the instruments "A," "D," "E," "G," "H," "J," "K," "L," "M," "N," "O," "P," "Q," exhibit skillful mechanical workmanship?

A. I should say a first-class mechanic had made them.

Re-cross- Q. 169. What should you say about "B." Does that exhibit first-class mechanical workmanship?

A. The instrument appears to me to have been made as an experiment. I consider myself a mechanic and have myself made far cruder experimental machines, in order to test certain movements or results.

Re-cross-Q. 170. Should you make the same answer about "C?"

A. So far as the base, supports, and uprights were concerned, I should.

Re-cross-Q. 171. Should you make a similar answer about the broken glass tumbler instrument "F?"

A. That instrument appears to have been made with care and by a person who thoroughly understood his business.

Re-cross-Q. 172. I notice in instrument "D" some blocks of wood or paste-board between the magnet and the walnut case, and a couple of wood-screws to hold the magnet in place. I do not see them in your drawing, and therefore suppose that they have been recently added. Is that a fact?

A. At the time of making the drawing the paste-board and screws referred to were not on the instrument, but during the making of the drawings, I had occasion to take the electro-magnet and permanent magnet from the body a number of times, which probably loosened them and rendered the paste-board and screws necessary to hold them in place to the body of the instrument.

Re-cross-Q. 173. Please look at instrument "J" and at the figure at the right-hand side of sheet 1 of "J," and particularly at the left-hand switch I', of the two central switches. You stated that when that was thrown over to the left it would touch the switch plate I^2. Is it not a fact that it can barely touch that plate, and cannot make the good and full contact that the switches in that instrument generally make?

A. Although said switch does not make as good a contact as the remaining switches, I think sufficient contact is made to fully answer all practical purposes.

Re-cross-Q. 174. Your same drawing, as corrected by you in your re-direct examination, shows, from the left-hand induction coil, three wires with loose ends connecting to nothing. I understand that it was one of those three wires which was accidentally broken by you when beginning to make your drawing, sheet 1. Am I correct in that?

A. It was; but which of the three I cannot say at this time.

Re-cross-Q. 175. With that exception, your drawing shows the wire connections as they existed when the instrument was brought to you, does it not?

A. It does.

Re-cross-Q. 176. The instrument to-day has the same wire connections as shown in the drawing, with the exception that the diaphragm wire is broken away from the hinge, as stated in your one hundred and seventy-fourth answer, has it not?

A. It has.

Re-cross-Q. 177. Please look at the drawing of "N." The figure marked "Front elevation, cap removed" shows that the dividing line between the two semi-circles forming the diaphragm runs along a line that would join the cores of the electro-magnets. Why did you put the diaphragm in that position?

A. Merely because I placed them without instructions and without design. I wanted to show the semi-circular diaphragm, and, if possible, the position of the magnets below such diaphragm, and so placed the diaphragm slightly apart, as shown, thinking the magnets would show through the opening. Afterwards, finding they did not show, I dotted them in. It may or may not be the correct position of the diaphragm. This, however, I do not know.

Re-cross-Q. 178. In the instrument "P reproduced," the pendant carbon block *f*, shown on sheet 2, is solid, is it not?

A. With the exception of the perforation for the spindle *f'*, upon which it hangs, it is.

Re-cross-Q. 179. In the instrument "Exhibit P," I understand from your testimony that the corresponding block (lettered O, on sheet 2, lower right hand figure) was divided, nearly its whole length, by a saw-scarf cut up from below in a plane parallel to the diaphragm, thus making a sort of fork, and that the leg of this fork nearest the diaphragm was broken off near the top, as shown by the diagonal line immediately above the letter O, in the same figure. Am I right in that?

A. It was so divided and broken, as shown. It may or may not have been made by a saw—it apparently was.

Re-cross-Q. 180. I observe that in comparing your "Drawing exhibit P, sheet 2," with your drawing "Exhibit reproduced P, sheet 2," rear elevations, that the connections are not the same in both. I suppose that you drew each of them just as they were at the time of drawing, did you not?

A. I did.

Re-cross-Q. 181. Comparing the upper right-hand figure of sheet 2, of "P," and the upper left-hand figure of sheet 3, of "P reproduced," I understand that when instrument "P" was brought to you it did not have the permanent horse-shoe magnet nor the electric magnet carried on one pole of it, nor the magnetic post carried on the other pole, nor the adjusting-screw for the permanent magnet, corresponding to what you have shown in "P reproduced." Am I right in that?

A. Such magnet, post, and screw were not in the instrument.

Re-cross-Q. 182. The recess at the right-hand side of the lower right-hand figure, sheet 2, of "Exhibit P drawing," did not have any diaphragm or rubber ring when the instrument was brought to you, did it?

A. No.

Re-cross-Q. 183. The instrument "P" had only one induction coil when it was brought to you, had it?

A. Only one.

Re-cross-Q. 184. In "Exhibit M," I understand that the wires run from the inner end of one binding post to the nearest coil; then from the other end of the wire of that coil to the second coil; then from the other end of the wire of the second coil to the second binding post. Am I correct in that?

A. They so run, the electro-magnets being wound in opposite directions.

Re-cross-Q. 185. Are you certain as to the time when you first saw Mr. Drawbaugh at Washington, being in the spring of 1880?

A. I am not positive as to that, but know that it was in the early part of that year; it may, however, have been in early summer.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 6th day of December, 1881.

FRED. M. OTT,
Examiner.

W. H. H. KNIGHT.

[*The examiner, at the request of counsel for respondents and with the*

LEPHONE COMPANY,-2

consent of complainants' counsel, certifies that he has ascertained that "Pennsylvania Day" at the Centennial at Philadelphia was the 28th day of September, 1876. Fred. M. Ott,
Examiner.]

Adjourned until December 7th, 1881, at 10 o'clock, A. M.

December 7th, 1881, 10 *o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

Daniel Drawbaugh, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is fifty-four; residence, Eberly's Mills, Cumberland county, Pennsylvania; occupation, machinist—that is the way I generally style it.

Q. 1. Are you the same Daniel Drawbaugh who is alleged in the defendants' answers to have invented the electric-speaking telephone prior to the invention of Alexander Graham Bell?

A. Yes, sir.

Q. 2. How long have you lived at Eberly's Mills?

A. All the days of my life, except about three years, to the best of my recollection.

Q. 3. From April 1st, 1876, to April 1, 1877, did you live at Eberly's Mills or Mechanicsburg?

A. I lived at Mechanicsburg; I moved there about the latter part of March, 1876; I can't give you the exact date, though.

Q. 4. Since you moved back from Mechanicsburg, about April 1, 1877, have you continuously resided at Eberly's Mills?

A. Yes, sir.

Q. 5. From the beginning of the war of the Rebellion down to the latter part of March, 1876, did you continuously reside at Eberly's Mills?

A. Yes, sir.

Q. 6. It is in evidence here that the "Drawbaugh Pump Company," by which I mean the first Company organized by Mr. William R. Gorgas and others for manufacturing your pump, as referred to on page

684 [655] of the defendants' printed record, was organized in May, 1867. At that time, May, 1867, in what house were you living at Eberly's Mills?

A. I was living in the same house I am living in now; the house back of the flouring mill.

Q. 7. At that time, May, 1867, where did you have your office or workshop?

A. The first story of the same house that I was living in.

Q. 8. Had you had it there for a good many years prior to that time?

A. Yes, sir; I moved there about 1856 and had my shop in the first story all that time.

Q. 9. The Drawbaugh Pump Company manufactured in the building where your shop now is, did it not?

A. Yes, sir.

Q. 10. Did you move your shop down to the building so occupied by the Company?

A. Yes, sir.

Q. 11. As near as you can remember, when did you move your shop down from your house to the Company's shop?

A. As near as I can recollect, it was in the fall of 1867, or winter of 1867-8. I can't give the exact date.

Q. 12. Ever since you moved your shop to the building occupied by the Company, have you continued to use the latter building as a workshop?

A. Yes, sir; I have had access to it ever since; part of that time I have been overseer there for different companies. I kept my tools there, and have had my shop there ever since.

Q. 13. How far is that shop from the house where you reside?

A. As near as I can judge, it would be between two and three hundred yards.

Q. 14. You have a wife and family, have you not?

A. I have.

Q. 15. How many of your children are now living?

A. Six.

Q. 16. What is the age and name of your oldest living child?

A. Her name is Laura and her age about twenty-two. I could give her birthday from a record that I have at home, but I could not give it here, from memory.

Q. 17. State whether or not her health is such as to enable her to be called as a witness in this case.

A. Her mind is very defective; particularly at certain periods; so much so as to render it improper to call her as a witness.

Q. 18. How long has she been an invalid?

A. From about the age of three years. Since she was quite a small child.

Q. 19. How old is your next oldest living child?

A. Between fifteen and sixteen. I have not informed myself as to their ages, as I could have done if I thought of it. Her name is Iola. We call her "Olie."

Q. 20. How many children have you lost by death?

A. Four.

Q. 21. You had at one time a daughter Emma had you not?

A. Yes, sir.

Q. 22. About what time did she die?

A. She died about 1870, I think; it might have been 1871. I can furnish the exact date if required.

Q. 23. How old was she at the time of her death?

A. Fifteen years and two months. I find I have a memorandum in my pocket which states that she died November 18, 1871.

Q. 24. Did you lose other children about the time of her death?

A. Yes, sir; two children, including her. The name of the other one was Ida. The two died the same week.

Q. 25. How old is your youngest living child?

A. About six years.

Q. 26. Have you been in the habit of making and preserving any written memoranda or records, to show the dates of your various inventions and improvements in telephones?

A. No, sir; not further than that I used to make plans on drafting boards, for working by.

Q. 27. Were they preserved?

A. No, sir.

Q. 28. Did you visit Washington city just previous to the breaking out of the Rebellion, in 1861?

A. Yes, sir.

Q. 29. State the time and the purpose of such visit, as near as you can.

A. I went to Washington city about the time stated, previous to the Rebellion, to have papers drawn up relative to the re-issue of a stave-machine, which I had patented previous to that time. There is a receipt among some of my papers which gives the date.

Q. 30. Please look at the receipt now shown you and state whether it is the receipt referred to or not.

A. Yes, sir; I believe that to be the receipt referred to.

[*Mr. Hill produces the receipt for inspection of counsel for complainants, and, by consent, a copy, as follows, is substituted for the original, the original to be produced when called for. The receipt is as follows:*]

"WASHINGTON, *January* 30, '61.

"Received of D. Drawbaugh the sum of twenty dollars—fifteen of which is for Gov. fee on his reissue in stave-machine & five for drawings.

"C. M. ALEXANDER."

Q. 31. Was that receipt given while you were in Washington on the visit last referred to?

A. Yes, sir.

Q. 32. Have you any recollection of meeting and conversing with a party of students at Washington while on that visit?

A. Yes, sir.

Q. 33. Do you remember any of the subjects of your conversation with them? If so, what subjects were talked about?

A. Yes, sir; I remember some of the subjects of conversation. I talked to them about a certain machine I was working on then. I termed it a machine for transmitting sound. I can't remember any words or parts that I mentioned. I would qualify the above answer a little. I don't know that I was working upon the machine at that time, but I had my mind employed upon it.

Q. 34. Do you recollect any of your statements to them about it? Did you state to them how far you thought you could convey sound, or by what means?

[*Objected to by Mr. Storrow.*]

A. To the best of my recollection, I stated that I thought I could convey sound to some distance, I would not be positive how far, and I may have stated that it would be by means of electricity; but I would not be positive about that either. I can't tell exactly when I first conceived the idea of conveying sound by electricity.

Q. 35. What is the best of your recollection and belief as to whether you talked to them about conveying sound by electricity at that time?

A. I believe, as I stated before; I am not so positive that I mentioned to them about electricity. I am not so sure that I had the idea about electricity. I know that it is a great while ago that I conceived that idea, but any particular period I can't state. I may have mentioned to them, though, that it was by means of electricity; I can't remember.

Q. 36. Do you remember the names of any of those students, or their place of residence?

A. I do not their names; the place of residence I do—of two of them; one of them, that I conversed the most with, was from Washington, Washington county, Pennsylvania; the other one was from Virginia; I can't give you his place or county; I only remember that he was from Virginia.

Q. 37. Mr. Henry B. Eberly, a witness heretofore examined for defendants in this case, stated in his thirteenth answer, [*Defdts' printed record, page* 297, 283,] and referring to you as follows:

> "I do recollect of him speaking about attaching an instrument to the office, by which he could hear all that was going on at the mill-office, without leaving his house. He made this remark one Sunday in the mill-office, in company of we boys, and a party that usually congregated in there. This was between 1861 and 1864; that is the nearest I can come at it; it was during the war."

State whether or not you recollect the particular conversation to which Mr. Eberly here refers.

A. I don't have a very distinct recollection, because them conversations were so many, but I have a faint recollection of some such conversation; I don't want to be too positive.

Q. 38. State whether or not you know of any fact that would lead you to believe that Mr. Eberly made any mistake in putting that conversation as far back as during the war—from 1861 to 1864.

[*Objected to by Mr. Storrow.*]

A. No, sir; I do not. I believe that I had them ideas in my mind at that time, or it might have been before.

Q. 39. Mr. W. M. Lory, a witness who has been heretofore examined in behalf of defendants in this case, has given a deposition, which I will now read to you.

[*Mr. Hill reads Mr. Lory's deposition, printed on pages* 235, 236, *and*

AMERICAN BELL TELEPH

237 [225-6-7] *of Defendants' record, and then continues his interrogatory, as follows:*]

Please state whether you have any recollection of the particular conversation to which Mr. Lory here refers.

A. I don't have any distinct recollection of any particular—we had a good many conversations, particularly on mechanics. This conversation may be correct. I was thinking on the subject as early, I suppose, as he states here. It may be as early as the time or dates he mentions in his statement, that I made an instrument, in which I used a tea-cup for the body of the instrument. I had other temporary apparatus connected with it, but I can't recollect the shape. I have been trying to recall it, and can't do it. I may have shown him a drawing in relation to an apparatus of the kind spoken of. I was in the habit of making sketches or drawings at the time when I would be working on any inventions—not only this particular one, but all inventions.

Q. 40. State whether or not you saw Mr. Lory, or had any conversation with him, between the time when he moved away from Eberly's Mills and last winter—1880-1881.

A. To the best of my recollection, I did not.

Q. 41. Mr. James A. Smith, a witness who has testified in behalf of defendants in this case, in his seventh answer, [*on page* 542 [519] *of Defendants' record*,] states as follows:

> "Early in the spring of 1867, Daniel Drawbaugh came into the mill-office, and had in his hand a copy of the *Scientific American*, on which there was small black spaces, I could not tell exactly the size, represented as streaks or rays of light striking out from a center. We began—I don't know how the conversation began—talking about electricity. I thought this was something on electricity. From this we began to talk about the telegraph—led into a conversation about the telegraph, and Mr. Drawbaugh remarked that the telegraph would yet be superseded, and men would talk audibly, as face to face, at any distance, saying at the same time that he was experimenting. I asked him at the time if he thought so, when he remarked: 'I am confident of it.' I don't remember of any other conversation, until within three days of that time—it might have been the next day, in his shop, when he told me that he and his daughter, I forget her name, but he says Emmy, had talked together, and that there was a floor and two partitions between them. At this time he did not tell me by what means they had conversed, but it made the impression on my mind that it was by a wire, but he did not say that. I don't know what made the impression, but that was the impression on my mind, that it was a wire. The daughter to whom Mr. Drawbaugh referred is now dead. I do not remember her name, but it was his oldest daughter."

LEPHONE COMPANY,-2

State whether or not you have any recollection of the particular conversation to which Mr. Smith here refers.

A. I don't have a recollection to the particular one conversation. I went there very frequently to the mill, to sit in the office and read. This conversation may have occurred, because I was then experimenting on that particular invention, and was assisted by my daughter. I am positive of that.

Recess for dinner, until 2 o'clock, P. M.

December 7, 1881, 2 *o'clock*, P. M.

Examination resumed pursuant to adjournment.

Present, same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 42. How was your daughter accustomed to assist you in those experiments?

A. She assisted me by speaking or producing sounds at one end of the apparatus.

Q. 43. Do you mean while you listened at the other end?

A. Yes, sir; and she may have listened, too, when I may have requested her to listen, while I would produce a sound—perhaps a word spoken, musical tone, or sound produced by some other apparatus or means. I used to adopt different ways—produce different sounds.

Q. 44. If you have a distinct recollection as to how large your daughter was during the early time of her assisting you in those experiments, please state, to the best of your knowledge and belief, and from your recollection of her size at the time, about how old she was when you first began to make use of her as an assistant in these experiments.

A. To the best of my recollection and judgment now, she was about six or seven years. I could not get at anything very accurate. I judge it to be that, alluding to the time she assisted me first.

Q. 45. She must have been quite a small child then—is that your recollection or not?

A. Yes; she was pretty small, I am positive about that. I judge her by a daughter I now have that is about that age—over six; and I know she was old enough to speak plainly; and I might state another reason. She would do what I would say—would not laugh at me, as some others did.

Q. 46. Was she your oldest child at the time?

A. Yes, sir.

Q. 47. You took out two patents on faucets, in November, 1866. Do you remmeber the fact?

A. Yes, sir; I remember the fact.

Q. 48. What is your best recollection and belief as to whether you first had the tea cup-machine for conveying sound from one place to another before or after the time of taking out those two faucet patents?

A. I am pretty confident that I had the cup machine before I took out those two patents. I know the cup instrument was made before I went to the lower shop, the one I now occupy.

Q. 49. Do you recollect the construction of that cup machinery pretty well at the present time?

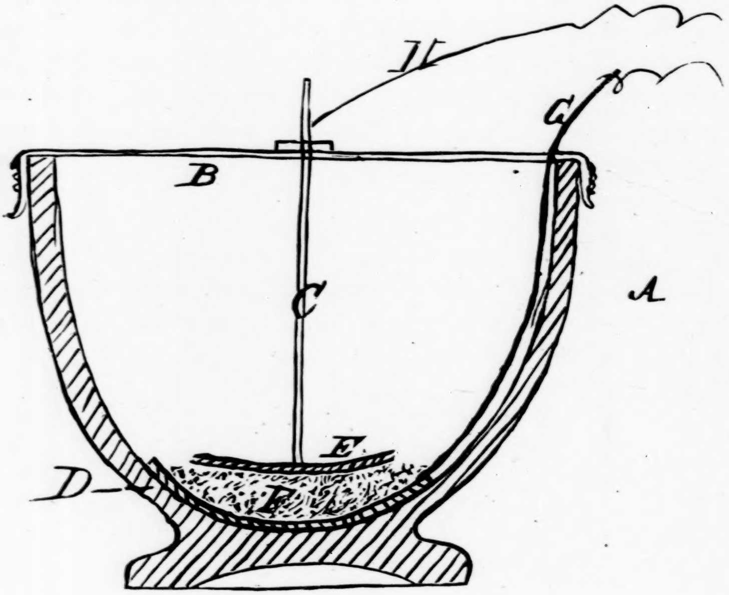
A Yes, sir; I think I can describe it clearly by a sketch—that is, I will make a sketch.

Q. 50. Please make a sketch of it.

[*Witness sketches with a pencil, and then answers.*]

A. Now that relates to the original cup. There were a good many modifications.

[*Defendants' counsel offers the sketch in evidence, to be marked* "*Exhibit D. Drawbaugh sketch, No.* 1."]



Q. 51. Please describe that cup-machine by reference to your sketch, and indicate by letters of reference the different parts, as you describe them.

A. A represents a section of the cup; B is a diaphragm of thin material, I don't remember exactly what; C was a metal rod, attached at its upper end to the diaphragm; at the lower end of said rod is a plate E attached to it; D is a second plate, concave, placed in the bottom of the cup; between these two plates was placed a material, which I term low conductor.

G is a wire running down into the cup and fastened to plate D; H is a second wire, attached to rod C; it occurs to me that it was wrapped around the rod; I don't remember whether it was soldered, or in what way it was attached.

One of those wires was placed to one pole of a battery, and the other to the other pole of the battery.

Q. 52. Was the cup an. ordinary porcelain or earthen-ware tea cup?

A. Yes, sir; a porcelain cup I was in the habit of calling such ware. It was a non-conductor of electricity.

Q. 53. Of what material were the two plates D and E composed?

A. To the best of my recollection, they were composed of copper. The lower one, I am more particularly sure, was of copper.

Q. 54. Of what material was the wire C composed?

A. I won't be too sure, but I think it was of brass, as I was in the custom of having brass wire around the shop for other work. The wire G may have been of the same material. I am pretty confident that the wire H was of copper, as that would be attached to the battery.

Q. 55. Are you sure whether the wires C, G, H, were electric conductors or not?

A. Yes, sir; I am positively sure that they were.

Q. 56. How was the diaphragm B fastened to the cup?

A. By a cord, or string, wrapped around the upper edge of the cup The diaphragm was of thin material.

Q. 57. You state that F was a material which you called a low conductor. Did you mean a low conductor of electricity?

A. Yes, sir; that is what I meant.

Q. 58. Did you use that cup instrument as a transmitter or receiver of sound?

A. As a transmitter of sound.

Q. 59. Explain your manner of using it in your experiments.

A. By producing sounds immediately at the top of the instrument, close to the diaphragm.

Q. 60. Please state whether you tried different materials for the diaphragm, and if so, mention the different materials you used.

A. Yes, sir; I used different materials. I ain't too positive that there were so many different materials used on the *cup*. I generally used hog's bladder, or some membranes of that kind.

Q. 61. Please state what material you used for the low conductor F in the cup machine; and, if you used different materials at different times with that machine, please give us an idea of your different experiments, with relation to such materials.

A. I did use different materials at different times. I have used earth that I got out between rocks—clean, fine earth. I used that in combination with plumbago at some certain times. I used plumbago alone at times, and I used fine or pulverized charcoal. I could not enumerate all. It has been a good while ago, and I don't remember all the different materials I did use.

Q. 62. State whether you did or did not make a great many experiments with different materials and with a great variety of materials, to ascertain what would answer best for the purpose of the low conductor F?

[*Objected to by Mr. Storrow as leading.*]

A. Yes, sir; I did, but I can't just now enumerate all that I did try. I remember, too, of using finely divided metals, and that was in combination with some of the others again. I also used it with plumbago, and perhaps in combination with earth. The experiments were so varied that I can't remember accurately every particular.

Q. 63. By your statement that you had the wires H G attached or connected to a battery, do you wish to be understood that you had it so connected when using the machine to transmit sound?

[*Objected to by Mr. Storrow as leading.*]

[*Question withdrawn by Mr. Hill.*]

[*Mr. Storrow objects that the difficulty is not removed by withdrawing the question after the witness has heard it.*]

Q. 64. Why did you use a low conductor F in your cup machine?

A. For the purpose of obtaining currents of different strength or intensity.

Q. 65. How did the low conductor, as used in your cup machine, enable you to vary the strength of the current?

A. By the compressibility of the material of the low conductor, the more compression, the more current—the stronger the current.

Q. 66. Did the instrument produce different degrees of compression on the low conductor?—and if so, explain how.

A. The instrument did produce different degrees; part of my experiment was by testing it with a galvanometer. The instrument produced different degrees of compression by the vibrations of the diaphragm.

Q. 67. What caused the vibrations of the diaphragm?

A. The sound produced immediately in front of the diaphragm. You might say, the air waves, produced by the sound, impinged upon the diaphragm.

Q. 68. When you were thus using the instrument, did you have an electric current passing through it or not?

A. Yes, sir; I had.

Q. 69. How was that current generated?

A. By a galvanic battery. The instrument was connected to the two poles of the battery by the two wires G and H.

Q. 70. When you were using the instrument, was that current a continuous current or was it intended to be broken by the operation of the instrument?

A. It was a continuous current, not a broken current. It was a modified current—not continuously of one strength.

Q. 71. Explain the reason why the current was not continuously of one strength when the machine was operating?

A. Because the low conductor F, being more compressed at some times than others, would vary the intensity of the current. The more it would be compressed the more would be the volume of the current—the more volume would pass.

Adjourned until December 8th, 1881, at 10 30, A. M.

December 8th, 1881, 10.30, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Smith and Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

Examination of Mr. Daniel Drawbaugh by Mr. Hill continued:

Q. 72. In the use of that old cup machine for the transmission of sound by electricity, did you succeed in transmitting any sounds through it so that they could be heard?

A. Yes, sir, I did; but I don't want it to be supposed—all parts of sentences—some words but feebly. I tried sounds—different sounds—made in the way of noises. I don't remember what different sounds, but I could distinguish different kinds of sounds more distinctly than I would words. What I wish to convey by that is that I could distinguish the difference between different sounds.

Q. 73. Could you or not by that old cup machine distinguish vocal sounds from other kinds of sounds?

A. Yes, sir; I know that the results I had there were sufficient to encourage me to go on with the experiments.

Q. 74. As the cup machine was only a transmitter, you must have used with it some kind of a receiver. Do you remember what kind of a receiver you used first with it?

A. The time since then is so long that I have no vivid recollection of any particular one. I had a number of crude apparatuses, but can't exactly remember the shape of any of them. I had membranes stretched over hoops—over a hoop. I remember that, and I had electro-magnets, and the arrangement was varied. I don't remember exactly the arrangement.

Q. 75. Do you recollect whether or not the receiving instruments that you so experimented with, or any part of them, were in the same circuit with the transmitter?

A. Yes, sir; they certainly would have been; I couldn't have had any results otherwise.

Q. 76. This old cup instrument that you have described was constructed with a diaphragm to receive vibrations caused by sound or sound waves. How did you first learn that sound had the effect to set up vibrations in solid substances?

A. By noticing vibrations in solid bodies—the surface of a partition.

Q. 77. How long before you made the cup instrument had you noticed that sound would produce vibrations in partitions?

A. That is a little hard to say; I can't remember how long; it might have been quite a number of years; I don't know.

Q. 78. Prior to making the cup machine, had you made any experi-

LEPHONE COMPANY,-2

ments to determine the effects of vibration of partitions, or what could be accomplished in the transmission of sounds by the vibrations of partitions?

A. I had made experiments—applied light bars of wood from one door to another. I remember in one particular—I passed through one room into the second room by a bar, and I found that there was sound produced or transmitted by the bar—not through the air, but by the bar.

Q. 79. Prior to the making of the cup machine, had you made any studies or experiments upon the vibrations of the vocal organs in the act of speaking?

A. Yes, sir; I remember I often placed my fingers on my throat or larynx, and uttered words, and the sensation produced by that appeared to be the same as the vibration of a solid body. It appeared to have the same sensation or feeling—and found that there appeared to be no cessation of vibration in words, but a continuous vibration, different from a sudden noise—from a mere tap [indicating by two or three taps upon the table.] There would be an intermission between those taps that would not be in a word—that is, in some words it may be.

Q. 80. Do sounds of different pitch contain the same number of vibrations per second or not?

A. No, sir; they do not. The higher the sound, the more the number of vibrations.

Q. 81. When did you learn this fact?

A. It would be a little hard for me to say when exactly. It occurs to me it was a great while ago. I can't put a particular period. When I was a young man, I used to attend singing school, and the professor used to give the philosophy of sound in that way—high sounds increasing the number of vibrations to the second, and he mentioned, too, I suppose, the number to the second, but my mind does not retain the number.

Q. 82. When you were experimenting with the cup machine, you say you used it in a continuous electric circuit; did it ever occur that that circuit was accidentally broken by the too great vibration of the diaphragm or not?

A. I don't remember whether I noticed it on the cup. I may have noticed that. But that has occurred in other apparatus or machines, I know. I can't remember that it happened with the cup, but it may have.

Q. 83. Please look at the machine marked "B," which I now offer in evidence as "Exhibit B," and state what that machine was, and who made it?

A. That machine was made for a receiver for transmitted sounds, and I made it.

Q. 84. Did you ever use that machine, or anything like it, in connection with the old cup instrument?

A. I ain't too positive. I may have used it with the cup machine. I know I used apparatus, but I ain't too positive that I used this. I may have used this.

Q. 85. Did you make this machine "Exhibit B" before or after you moved your shop from the house close by the grist-mill down to the building where it now is?

A. I won't be too positive that I made it before, but I think I did.

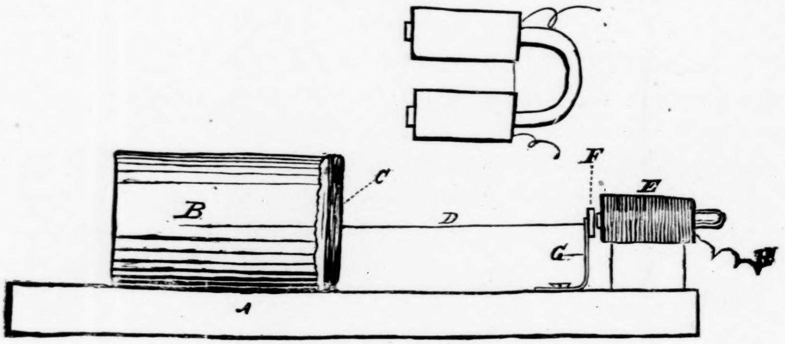
Q. 86. Please look at "Exhibit reproduced B drawing," and state how that compares with "Exhibit B," as the latter existed at about that time.

A. It does not compare, as it existed then—that is, the electro-magnet was not placed as it now is placed. It was some inches further back on the board—that is, some inches from the membrane or diaphragm. I can't distinctly remember the space—say four or five inches from the diaphragm. There was a cord or string fastened to about the center of the diaphragm; it ran back to an armature; that armature was secured to the same base-board. The electro-magnet was immediately in front of the armature—not quite touching.

Q. 87. Will you please make a drawing or sketch of the instrument as it was when in the condition which you have last described?

A. I now make it, and here it is.

[*Defendants' counsel puts said sketch in evidence as "Exhibit D. Drawbaugh sketch, No. 2." The following is a reduced wood-cut of it.*]



Q. 88. Please describe the machine shown in "Exhibit D. Drawbaugh sketch, No. 2," making reference to the drawing and reference letters thereon in your description.

A. A represents the base-board, of wood; B a tin can; it was a can with the bottom out; C represents the membrane or diaphragm; D a string or cord, one end fastening to the center of diaphragm, the other end attached to armature F; E an electro-magnet; F armature; G a bracket or spring holding armature; H an end of the wire of the coil of electro-magnet. That is the description.

Q. 89. What was the shape of the electro-magnet E?

A. Its shape was the old style magnet—U shape. I might put another figure on the sketch, showing the shape of the electric magnet.

[*The witness thereupon adds to the last-mentioned exhibit a separate figure to represent the electro-magnet.*]

Recess for dinner until 2.30, P. M.

December 8, 1881, 2.30 *o'clock*, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of D. Drawbaugh by Mr. Hill continued:

Q. 90. When this instrument, shown in your sketch No. 2, was used as a receiver, what part of it, if any, was in the electric-circuit of the transmitter?

A. The electro-magnet.

Q. 91. What, if anything, was contained in the tin tube B?

A. It had been coated with plaster-of-Paris.

Q. 92. Where did you put your ear to listen to the sounds transmitted?

A. To the end of the tube farthest from the diaphragm.

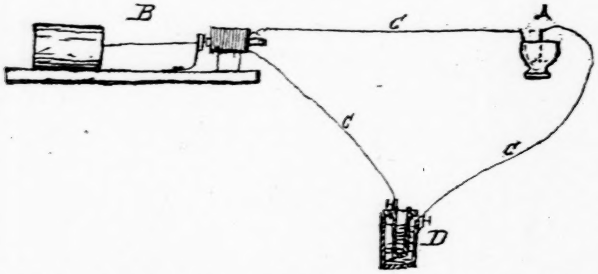
Q. 93. Do you recollect whether or not you used the old cup transmitter in connection with this receiver, which is shown in your sketch No. 2?

A. I think I did; to the best of my recollection, I did.

Q. 94. Will you now please to make a sketch, showing the cup transmitter, this receiver, with the line-wires and battery connections from one to the other? and in doing this you need not be particular about drawing the form of the transmitter and receiver, inasmuch as you have already represented them in your two preceding sketches.

A. Yes, sir; here it is.

[*Mr. Hill offers the sketch in evidence as "Exhibit D. Drawbaugh sketch, No. 3."*]



Q. 95. Please describe the apparatus represented on "Exhibit D. Drawbaugh sketch, No. 3," making use of the sketch and the letters thereon, by way of illustration.

A. A represents the cup transmitter, B the receiver, D galvanic battery, C C C circuit wires.

Q. 96. In the cup transmitter, in what condition was the low conductor? that is to say, was it in the form of a loose powder, or a paste, or a hard cake, or what form?

A. In the form of a loose powder; at times finer than at others. I made changes; sometimes I made it finer than at other times, but in a moist condition generally in the cup transmitter.

Q. 97. Why did you moisten the powder generally in the cup transmitter?

A. Because, in some of the materials I used, it produced better results, or I thought it produced better results, and I got in the habit of moistening it.

Q. 98. In the cup transmitter, did you ever use a mouth-piece above the diaphragm?

A. Yes, sir; a cover with a hole in; I didn't call it a mouth-piece particularly—a cover with a hole in the center.

Q. 99. Referring now to "Exhibit reproduced B drawing," to the best of your recollection and belief, how long was it that you used the form of machine represented in "Exhibit D. Drawbaugh sketch, No. 2,", before you changed the receiver to the form shown in "Exhibit reproduced B drawing"?

A. That would be a little hard for me to give you the length of time; it might have been a year—it might have been two years; I have no recollection of the exact length of time.

Q. 100. Did you ever, at any time, use a metal diaphragm on the cup transmitter, or on the receiver, when it was in the form shown in "Exhibit D. Drawbaugh sketch, No. 2"?

A. I can't remember of using metal at any time on that; I may have, as there was changes made; that is, I used different membranes—soft materials for diaphragms; but I have no recollection of using metal.

Q. 101. Please explain the different parts represented in "Exhibit reproduced B drawing."

A. B is a tin tube or can, as I termed it, with the bottom out; C is a strap of metal, to secure B to the base-board A. D′ represents the diaphragm; *d* armature attached to diaphragm; E electro-magnet; F′ plate to secure magnet to base; G is a metal bracket or spring for giving tension to membrane or diaphragm.

Q. 102. Did you, or did you not, actually use this instrument, "Exhibit B," as a receiver, in the form in which it is shown in "Exhibit reproduced B drawing?"

A. Yes, sir.

Q. 103. State whether or not, as you so used it, the metal strip or spring, marked G, in the drawing, had any electric connection with the circuit or with the instrument.

A. No, sir.

Q. 104. State whether or not, as you used this instrument, "Exhibit B," the electro-magnet marked E was in the line circuit.

A. Yes, sir.

Q. 105. How was the armature *d* secured to the diaphragm?

A. By something adhesive—glue. At other times I used bee's-wax, to secure it.

Q. 106. Did you arrange the armature so that, when vibrating, it would come in contact with the electro-magnet or vibrate in the neighborhood of the poles of the electro-magnet without coming in contact?

A. When I adjusted it, I had it to come close to the poles of the electro-magnet; so close that it would nearly touch; still not in contact. It would not come in contact in vibrating; that would destroy the working of it.

Q. 107. State whether the little metal strip or spring G was adustable or not.

A. Yes, sir; it was. There was a slot towards the outer edge of the bracket or spring for the purpose of setting it up closer to the diaphragm by means of a screw, *g'*.

Q. 108. What, if anything, was contained within the tin tube, B?

A. A coating of plaster-of-Paris.

Q. 109. Why did you apply a coating of plaster-of-Paris inside of the tube of this instrument, and inside of the tube when used, as shown in "Exhibit D. Drawbaugh sketch, No. 2?"

A. It is considered a low conductor of sounds. I had reasoned in my mind that the sound produced by the effect of the electro-magnet wouldn't be absorbed by echo or re-vibration, by the use of the plaster-of-Paris.

Q 110. Was the tin tube which was used in the instrument shown in "Exhibit D. Drawbaugh sketch, No. 2," the same tin tube which was used in "Exhibit B?"

A. I wouldn't like to be too positive on that. There may have been others similar. I made changes; but I think it was the same.

Q. 111. Were the electro-magnet and armature of "Exhibit B" the same identical ones that were used in the machine represented in "Exhibit D. Drawbaugh sketch, No. 2?"

A. No, sir; the first magnets were much larger. There may have been half a dozen changes in magnets; perhaps more. I couldn't tell the number.

Q. 112. Is the base-board of "Exhibit B" the same identical base-board which was used in the machine when in the condition represented in "Exhibit D. Drawbaugh sketch, No. 2?"

A. I think not. I won't be too positive as to that. But it seems to me that the board was longer.

Q. 113. What was the next transmitter which was used after the cup machine, of which you have spoken?

A. A tumbler; that machine, [indicating "F."]

[*Defendants' counsel offer in evidence, as "Exhibit F," the machine last referred to by the witness.*]

Q. 114. Please look at "Exhibit reproduced F drawing," and state whether it does, or does not, correctly represent the tumbler instrument as you used it at any time.

A. Yes, sir; it represents the tumbler instrument as used at a time —not exactly the original—not the arrangement that the original instrument had.

Q. 115. In what respect does it differ from the original instrument F, as first used by you?

A. It differs in this respect. In the reproduction I used a yoke, represented in the drawing of the reproduction, F F; the original having only one post, or bar, or rod, instead of a yoke, as shown in "Exhibit F drawing." There were modifications. The mouth-piece of the original was large—with a larger opening, like that on "Exhibit F." I had made different mouth-pieces—modified them—made them of different shapes. I can't give the different modifications. The first ones were much larger and higher—higher from the diaphragm.

Q. 116. What part or material in the original machine, "Exhibit F," corresponded to the part marked G, in "Exhibit reproduced F drawing"?

A. That was a low conductor, as I termed it.

Q. 117. Please explain the working parts of the machine, as shown in "Exhibit reproduced F drawing."

A. F F represent two rods, passing into the tumbler or instrument A. On the inside and attached to the rods F F is a wooden box D, or cup, for holding the low conductor G. E is a plate passing into said wooden box and resting on to the low conductor. To said plate is attached a rod *e* which passes up and is attached to the diaphragm C, at its center; *d* represents a plate in the bottom of the wooden cup; *d'* is a small wire connecting said under plate *d* to the rod F; H is a wire connected to the diaphragm; B is a wooden mouth-piece attached to the glass tumbler A and secured by pressure in a groove of the mouth-piece B. There are two adjusting screws, one on each rod F, for the purpose of adjusting the wooden box closer to, or further from, plate E.

Q. 118. Of what material were the two plates E and *d*, at the top and bottom respectively of the low conductor?

A. I'll have to answer that by stating that in the modified plan plate E and plate *d* were composed of copper, that is, they were cut out of daguerreotype plates—their faces were silvered.

Q. 119. How were they in the original and first tumbler instrument?

A. They were of tin plate; that is, sheet-iron tinned.

Q. 120. You have spoken of the rod F as a yoke and as rods; was it in one piece, or in more than one, and of what material was it?

A. It was in one piece; its material was brass.

Q. 121. Of what material was the little wire *d'*, that connected the rod F to the lower plate *d*?

A. It was of copper; I think it was copper.

Q. 122. What was its purpose?

A. For making an electric connection.

Q. 123. Of what material was the rod *e*, that connected the upper plate E to the diaphragm?

A. I don't want to be too positive; but I think it was copper.

Q. 124. Are you sure whether it was an electric conductor or not?

A. Yes, sir; I am sure of that fact—that it was an electric conductor. I thought that was understood.

Adjourned until December 9, 1881, at 10, A. M.

December 9, 1881, 10 *o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of D. Drawbaugh by Mr. Hill continued:

Q. 125. When this instrument, shown in the "Exhibit reproduced F drawing," was used, what were its electric connections—how was the circuit made through it?

A. Through one of the rods F, then through small wire *d'* to bottom plate *d*, then through low conductor G to upper plate E, then through wire rod *e* to diaphragm C, then through H wire.

Q. 126. Was this instrument used as a transmitter or receiver?

A. It was used as a transmitter.

Q. 127. Were all the different forms of the tumbler instrument used as transmitters or not?

A. Yes, sir; all the tumbler machines were used as transmitters.

Q. 128. Of what material was the diaphragm of the tumbler instrument composed, and if it was composed of different materials at different times, please state of what materials, so far as you remember.

A. To the best of my recollection, the diaphragm was composed of different materials at different times. In the original instrument I had used hog's bladder, or parchment, or something of that kind; and at other times I would use thin metals—as a general thing, tin when I used metals.

Q. 129. When you used the tumbler instruments as transmitters, did you use them in a continuously closed circuit, with a receiver and battery, the same as you used the old cup transmitter, or not?

[*Objected to by Mr. Storrow as leading.*]

A. Yes, sir; the same as I had used the old cup transmitter.

Q. 130. How did the purpose of low conductor G in the tumbler transmitters compare with the purpose of the low conductor in the old cup transmitter?—was it for the same or a different purpose, and to operate in the same or a different way?

[*Objected to by Mr. Storrow as leading.*]

A. It was for the same purpose and to operate in the same way; only in the tumbler transmitter I had made a good many changes of low conductors—and experiments. I used at different times different materials or compositions for that purpose.

Q. 131. State, so far as you recollect, the different changes that you made in the material or materials of the low conductor G, in the tumbler transmitter.

A. I made so many changes that it would be hard to enumerate them all. Some of them I can. I understand the question to relate to the tumbler transmitters. I don't remember whether I used earth in these. I ain't positive about that. In the former instrument—that is, in the cup—I had used earth. In this, or the tumbler instrument, I had used plumbago alone, and I had used plumbago mixed with other materials, that is, with carbons—and pulverized charcoal and plumbago; and at times, I had used charcoal alone; at other times finely divided coke and charcoal mixed, and also pulverized coke alone. I had used bronze—that is, finely divided metals—mixed with carbon or coke, and used various other materials that I can't think of.

Q. 132. Did you pulverize the bronze yourself, or procure it in a pulverized condition?

A. No, sir; I think not. I generally had that in the shop—bronze. You generally asked for brass bronze. It is sold in the shops by the name of bronze. There are two kinds, high and low bronze; low bronze is the best, but is a little higher in price. It comes in a pulverized state. It is a known article of commerce. There are quite a number of tints in the different kinds sold. I generally used the yellow kind—that is a good quality of brass, not tinted with other colors.

Q. 133. In these tumbler instruments, was the low conductor used in the form of a powder, or of a solid cake, or how?

A. As a powder; not always of the same degree of fineness, but generally as a powder.

Q. 134. You have testified that in your experiments with the cup transmitter you sometimes moistened the low conductor. Did you ever do anything of that kind with the tumbler transmitter or not?

A. Yes, sir; but in a different way. In the tumbler transmitter, the box or cup holding the low conductor did not extend to the bottom of the tumbler, but there was a space between the bottom of the box and that of the transmitter or tumbler. In that space I put water, which moistened the conductor—by that means moistened the low conductor.

Q. 135. How did the water communicate to the low conductor so as to moisten the low conductor? and did you always moisten the different kinds of low conductors to the same extent or not, in the tumbler instrument?

A. It took up water by evaporation—that is, the low conductor was moistened by evaporation. I did not always moisten the low conductor to the same extent. I had moistened it thoroughly—placed water so that it thoroughly saturated the low conductor in the box; but I found that would not answer. A number of times it occurred that it became that way by being tipped over—that the water got in that way accidentally, or by careless handling.

Q. 136. In both drawings, to wit: "Exhibit F drawing" and "Exhibit reproduced F drawing," there is represented within the glass walls of the tumbler, a lining which the draughtsman's reference tables state to be plaster-of-Paris lining. Were the tumblers of the tumbler transmitters lined with plaster-of-Paris?

A. Yes, sir; I believe I stated that before.

Q. 137. In the cap or cover, shown in "Exhibit F drawing," I observe a similar lining of plaster-of-Paris; but in the cap or cover of "Reproduced F drawing," I do not observe a plaster-of-Paris lining to the cap or cover. Did you use the cap or cover both with and without the plaster-of-Paris lining? Please state the facts in relation thereto.

A. I did; at different times I made different covers, and was in a hurry, perhaps, that I didn't take time to coat them with plaster-of-Paris; and discovered, too, that I didn't gain much good results by the plaster-of-Paris lining.

Q. 138. When you used the metal diaphragm on the tumbler transmitter, state whether the conducting rods F were, or were not, in electric contact with the diaphragm.

A. They were not.

Q. 139. How was the contact avoided?

A. By cutting away a portion of the diaphragm at the point where rods F passed through it. The diaphragm should have shown that.

Q. 140. Did the tumbler in which you placed water below the low conductor box have a bottom to it?

A. Yes, sir.

Q. 141. In "Exhibit F drawing," and in the machine "Exhibit F," I observe that the tumbler there shown has no bottom to it, the bottom having been broken off or removed. Did you have a tumbler instrument in which the tumbler had no bottom among your original tumbler instruments?

A. Yes, sir, I had; that is, after it became broken accidentally, I had still used it. I found that it would answer without having it dampened; that is, the later low conductor that I used could be used without being moistened—in a dry state.

Q. 142. Have you any recollection whether, in your tumbler transmitters, you always used the same identical tumbler, or whether you had different tumblers for the purpose?

A. I can't remember of using only the one; I may have used more.

Q. 143. In "Exhibit F," which is represented in "Exhibit F drawing," did you or did you not use a low conductor in the electric circuit?

A. I did; yes, sir.

Q. 144. It seems to have been lost from the machine, and is not shown in the drawing. Will you please describe where it was placed and how it was held in place, referring to the drawing, if you please, by way of illustration?

A. Yes, sir; there was a wooden box placed around the lower plate D, a box similar to D in "Exhibit reproduced F drawing." In that was placed the low conductor. Upper plate E was allowed to rest on the top of the low conductor. A wire *e*, now partly broken off, extended up and was secured to diaphragm, in a manner similar to rod *e*, in "Exhibit reproduced F drawing." Rod C passed up through the wooden cover B. Outside of cover B was a screw—I think, a thumbscrew nut—holding rod C in position.

Q. 145. In those tumbler instruments, and in the old cup transmitter, how was the central rod that extended from the diaphragm down to the plate which rested on the low conductor secured to the diaphragm, when the latter was made of bladder or parchment, or similar material?

A. There was a plate fastened to the diaphragm at about its center, and the rod was secured to that place.

Q. 146. When the diaphragm was made of metal, how was the rod secured to it?

A. It was directly attached to it by solder; I think, by solder; it was an electric connection; I am confident of that.

Q. 147. When using the tumbler transmitter in the form shown in "Exhibit F," and represented in "Exhibit F drawing," how were the line wires connected to the transmitter, and how did the circuit go through the instrument?

A. One of the line wires was attached to the rod C, the other line wire was attached to a wire that was attached or secured to the plate that was attached to the center of the diaphragm. I would state here, that that is to the best of my recollection. The current passed through rod C into plate D, through the low conductor; then to upper plate E; then into wire *e*, now broken off; through wire *e* to small plate secured to diaphragm; then through wire attached to said small plate to the line; either the zinc pole or the copper pole could be connected to rod C; it would make no difference which.

Q. 148. Did you have any idea or theory at that time as to the reason why the low conductor, when under pressure, would allow the electric current to pass more freely than when not under pressure? If so, what was your theory regarding it?

A. I think I had a theory or an idea. The conductor in a loose way wouldn't be in a condition to conduct as large a quantity of electricity as when compressed; it would resist more than when compressed.

Q. 149. Why?

A. The particles were further separated when loose.

Q. 150. Do you remember how you first obtained knowledge of that fact, that low conductors when under pressure would conduct the current more freely than when not under pressure—that is to say, did you learn it by reasoning it out and then testing it, or by accidental discovery, or by reading it somewhere, or by hearing it from some one, or how?

A. I don't remember how I came to it. I had been experimenting

LEPHONE COMPANY,-2

in that direction. I don't remember of getting at it by accident, either; don't remember of reading it; I don't remember of any one telling me of it. I don't suppose any one told me.

Q. 151. State whether or not you had at that time the acquaintance of many skilled electricians or scientific men.

A. I had not. I can't remember of having the acquaintance of even one.

Q. 152. Did you, or did you not, know at that time that the fact that conductors would pass the current more fully when under pressure than when not under pressure, was a fact unknown to the scientific world, and that its discovery was a new discovery?

A. I didn't know; it was a trial. I couldn't tell until I tried it. I didn't know whether it was a new discovery or not. I had no way of knowing whether it was a new discovery or not.

Q. 153. What books or printed works on the subject of electricity had you read or did you possess prior to your making the cup transmitter?

A. I had been reading the *Scientific American* at an early time. I had been a subscriber at a pretty early day, but don't remember of reading anything in it on that subject. I had some old school philosophies—Comstock's, I remember—but don't remember of reading anything on the subject;—on the subject of low conductors I have reference to.

Q. 154. My question referred to electricity generally. What printed works had you read on that subject prior to making the cup transmitter, so far as you remember?

A. So far as I can remember, as I stated before, I was a subscriber to the *Scientific American*, and may have read it in there; and I also had the philosophies—Comstock's, and I think, Parker's,—both old books—that is, I had them prior to that time.

Q. 155. Do you understand the French language, or can you read and understand books printed therein?

A. No, sir.

Recess for dinner until 2, P. M.

December 9, 1881, 2 *o'clock*, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued.

Q. 156. What receiver did you generally use in connection with the tumbler transmitter during the first year or two that you had the tumbler transmitter?

A. The instrument that I termed the tin can, "Exhibit B."

Q. 157. Did you use those instruments in the continuous electric circuit, as you have described, in connection with the cup transmitter, or not?

A. Yes, sir; I did.

Q. 158. What results did you get from such use?

A. True copies, if I may use the term, of different sounds made—that is, spoken words or musical tones.

Q. 159. Explain how you used to test them.

A. I used to place a clock or watch in the neighborhood of the transmitter and I would listen at the receiver—the tin can instrument. I also would have persons to speak into the transmitter, while I would listen at the receiver; and also I would speak into the transmitter while others listened at the receiver.

Q. 160. Where was this—in what building?

A. It was in the shop down at the creek—the one I now occupy.

Q. 161. Did you test the instrument with the tumbler transmitter and "Exhibit B" receiver in the same room, or in different rooms; and on the same floor, or on different floors of the shop or building?

A. I tested them on different floors and also in different rooms of the shop. I sometimes would have the transmitter in the cellar; that would be three floors or stories below where the receiver would be. I mean the third story below. I also tried them in different rooms; having the transmitter in one room and the receiver in the other, on the same floor. I also tried them with one floor between them, one in the part of the shop where we worked, and which we called the first story, and the other in the story next above that. Oftentimes I would have one instrument on the second story at one end of the shop, while the other instrument would be on the first story at the opposite end of the shop.

Q. 162. State whether you were or were not in the habit of testing the telephone with the receiver and transmitter so far apart, or so separated by partitions or floors, that the sounds which were made could be heard from the transmitter to the receiver only through the instruments. What was the fact about that?

A. I am positive that the sounds received or produced came through the instruments.

Q. 163. What was your object in putting the transmitter down in the cellar and the receiver on an upper floor, when testing and using the telephone?

A. For the reason of having greater distance between the two instruments; to be sure we did not hear the words, only through the instruments.

Q. 164. How were the line wires arranged and fastened between the different points at which you tested the two instruments—the transmitter and receiver?

A. In different ways at different times. I had them placed at so many different places that I can hardly enumerate all the different ways I had of having them fixed. I will try to describe some of the ways that I had. At one time I had the transmitter in a small room at the north-east corner of the shop—the corner on the Yellow Breeches, down stream. The transmitter was placed on a table; a battery was placed under the table, resting on a bench; the line wires passing up through the loft or garret floor, close to the east wall of the shop; the wires passed on the loft towards the south end of the shop, then down again through the floor to a window where was placed a receiver. At a time I had a large roll or coil of wire connected in the line, on the loft; there may have been two or three hundred feet or more of wire; I don't know exactly. At other times I had the transmitter in the south-east corner, or near the south-east corner; the line wires went from a bench or table that was in that end of the shop, to the ceiling of the same story; passed along that ceiling to the north end of the shop, then down through that story or floor to the story below. And then, at other times, I had the receiver in the cellar, the wires running up along the west wall of the shop to the third floor, or, as we term it, the second story. It is the third, including the cellar or basement floor. Then I had it connected to a ground wire and plate in the cellar. Another ground wire and plate, west of the shop, back of an old blacksmith shop, was placed in the water in the dam. The line wire from the cellar, at the east side of the cellar, ran up to the second story, passed through that story to the west side of the shop, then through that side, out over the top of the blacksmith shop, to the receiver. I wanted to get distance for transmitting by means of an earth circuit. I tried the transmitter, both in the cellar, at the east side of the shop, and the receiver back of the blacksmith shop; then, *vice versa.* The results were not very good with a ground line. I could not hear much; the ground connection was too short; there was not a sufficient quantity of earth. Short ground lines, you know, won't work as well as lines of a greater distance. I don't just remember of any other connection that I had. I had the instrument in so many different places in the shop that I can't remember all the places.

Q. 165. Did you understand my last question as asking for the ways in which you arranged the lines during the early days of your experiments with the tumbler transmitter and the receiver "B"? That is to say, during the first year or two of your experiments with those instruments.

A. I wasn't positive whether you meant only the tumbler. My understanding was that the question related to my earlier experiments, but I did not know it was limited to that particular transmitter and receiver. My answer did not relate to any particular period; say, about 1870 or 1871. I couldn't tell the letter of the instrument without seeing the drawings.

Q. 166. Please look over the drawings and see how the instrument is lettered that you refer to as in 1870 and 1871.

A. This is the instrument I referred to, marked "C."

[*Witness having looked over the drawings and selected the drawing marked "Exhibit C drawing."*]

Q. 167. Did you make the original instrument marked "C"?

A. Yes, sir.

Q. 168. Did you make it before or after you made the tumbler transmitter, "Exhibit F," and the tin box receiver, "Exhibit B"?

A. Yes, sir; I made it after.

Q. 169. George W. Drawbaugh, who has testified for defendants in this cause, has stated, on pages 623 and 624 [597 *and* 698] of Defendants' record, that in 1870 or 1871, he had knowledge of your talking-machine at a time when he was building a new wagon-box and repairing the running part of a wagon for Jacob M. Sadler, at which time he talked into it for you to listen, and you talked into it for him to listen. Have you any recollection of the circumstance of the repairs on that wagon at that time?

A. Yes, sir; I have.

Q. 170. Did you do anything on the wagon? If so, what?

A. Yes, sir; I done the striping and the lettering on the wagon. There was some painting or design representing a machine—a hydraulic ram—on the sides of the wagon. I did that.

Q. 171. Does that fact of your doing that painting on that wagon connect itself in any way in your memory with any particular telephone experiments that you were making at the time? If so, what?

A. Yes, sir; it does. I had this instrument "C" placed on a bench pretty close to where I was painting the wagon, and was conducting some experiments with it. There was no one in the shop at the time but myself. This instrument "C" was on the second story of the shop, where I was doing the work on the wagon. There was some one came into the door of the shop on the first story. I thought it might be Mr. Jacob Sadler. He was anxious to have his wagon finished. I thought he wouldn't be very well satisfied if he found me experimenting with this instrument. I shoved the instrument aside and covered it with something. When the person came up into the shop, I found it was not Mr. Sadler; it was a boy; the boy's name was Norman Kahney. While I was painting that wagon, Mr. Jacob Sadler came there very frequently—every day.

Q. 172. Do you remember what experiments you were making there alone on the instrument "C" at that time? If so, please state?

A. I can't exactly say. My experiments were so numerous that I don't just remember. I sometimes placed a clock and sometimes a watch at one instrument and listened at another instrument.

Q. 173. State whether you have or have not any recollection of experimenting with a galvanometer in connection with the instrument "C" and some other instrument, and studying the different effects.

A. Yes, sir; I have. I very often had a galvanometer in the line with different instruments—not only this, but other instruments. But I found that when a galvanometer was placed in a circuit with this instrument "C," the galvanometer was not deflected—not so much; it was hardly noticeable. I compared and tested "C" with the tumbler and with other later instruments in this respect.

Q. 174. At the time you painted Mr. Sadler's wagon, was the instrument "C" in a condition to transmit sounds or not?

A. Yes, sir; it was.

Q. 175. To the best of your recollection, how long had it been made at that time?

A. I couldn't be positive as to the length of time. It may have been made three, six, or nine months before, or perhaps a year. I don't remember.

Q. 176. Had you used the tumbler instrument "Exhibit F" and the tin box receiver "Exhibit B" for transmitting sounds before you made the instrument "C," or not?

A. Yes, sir.

Q. 177. To the best of your recollection, how long had you used hem before you made the instrument "C?"

A. I couldn't positively say how long, it may have been several years—two or three years. It might have perhaps been more.

Q. 178. During that time, and before you made instrument "C," what results had you been able to get with instruments "B" and "F?"

A. Sufficiently good to be heard distinctly; There were even words that were whispered. You couldn't just hear the words exactly, but could hear the whispering. I did that often. Spoken words you could hear—the whole sentences; I mean words spoken out loud, and not whispering merely. I would have persons in the cellar reading printed matter—some advertisement or something—and I could hear the words that were read; and at other times I would go down into the cellar and read something, and coming up they would repeat the words to me that I had read.

Adjourned until December 10th, 1881, at 10, A. M.

December 10, 1881, 10 *o'clock,* A. M.

Examination resumed pursuant to adjournment.

Present, same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 179. When you were using these two instruments "F" and "B," before you used "C," how did you have the line wires arranged?

A. I think I did not have that line running over the blacksmith-shop; I think not; I ain't positive. I had the other lines that I referred to.

LEPHONE COMPANY,-2

Q. 180. Please describe the instrument "C" as it originally existed.

A. It is the instrument which, in its present condition, is represented in "Exhibit C drawing." Referring to that drawing, A is a base-board; B an upright board or projection; C C are upright pieces supporting said projection.

Through B, at about its center, is an opening to admit the case of a hollow walnut chamber D; at the end where the letter D is marked, is a contracted opening for receiving sound.

At the opposite end from the contracted opening is a diaphragm indicated by letter G, on figure marked "section through body of instrument."

H, in same figure, represents an armature attached to the diaphragm. As the instrument originally existed, the little pin, marked *h*, was not there. The hollow chamber D was no longer in the original form of the instrument; it had within its body two thin membranes, the first of which was slipped on and held in place between these two pieces by friction [*indicating the body of the chamber D and the rim E,*] and the second was held in place by another wooden ring pressed down upon it, inside of the rim E; the rim E was originally longer than it now is, a part having been sawed off, about an inch long, which I now produce.

[*Mr. Hill offers in evidence the portion which has been sawed off, including the wooden ring for holding the second membrane, to be marked "Exhibit prolongation of rim E of instrument C."*]

The membranes extended entirely across the inside of the hollow chamber, and were intended as diaphragms. This sawed-off portion is not shown in the drawings.

There was a thin cord or string fastened to the center of the second diaphragm, which I have mentioned—the one which was held in the portion of this ring which has been cut off; the cord passed on through and was fastened to the other diaphragm at its center.

To the outer diaphragm was attached an armature; just immediately in front of that armature was an electro-magnet, which was in the circuit with the tumbler instrument "F," when originally made.

The inner diaphragm was pierced with several small holes; the holes were about a quarter, or perhaps a half inch in diameter, cut out of the membrane, between center of the membrane and the inner edge of the case. That was the diaphragm that did not have the armature attached to it, and it was the one which was next to the ear when listening

When the machine was originally made, it was intended to be a receiving instrument. At some period after that—I can't remember the length of time—I took off the bar that connects the two cores of the electro-magnet and held or placed a permanent magnet to the said cores and used it in that way; I then found that I could use it for a transmitter. Then at some period later than that again—I can't remember the length of time—I took and sawed off the end of the case and thus removed the part which has been put in evidence as "Exhibit prolongation of rim E of Exhibit C." I also removed the inner membrane, except the fragments that now remain. In its stead I placed a thin metal diaphragm, as shown in "Exhibit C drawing." The material of the diaphragm was German silver, and it was held in place by a tin ring. In the center of said diaphragm is secured the armature H, as shown in said drawing. In front of that was placed an electro-magnet, the poles being close to the armature, but not quite touching.

At the opposite end of the electro-magnet—that is, at the end usually having the bar or heel-piece—was placed a permanent U magnet; the poles of said permanent magnet were in contact with the cores of the electro-magnet. In that modification it was used as a transmitter, and also could be used as a receiver, but was more practically a transmitter.

Q. 181. As the instrument then existed, after you had made the modifications referred to in your last answer, did it, or did it not, contain the identical diaphragm G and case D E now contained in the instrument "C" which is before you on the table?

A. Yes, sir; and also the identical armature, but not the pin marked *h* in the drawings, and now on the armature.

[*Mr. Hill offers in evidence the instrument* "*C*," *to be marked* "*Exhibit C.*"]

Q. 182. When Mr. Knight made his drawings, he stated in his table of reference in "Exhibit C drawing," that the diaphragm was of tin. Did he make the drawings from this identical diaphragm, which is now on "Exhibit C?"

A. He did, to the best of my knowledge. His statement that the diaphragm was of tin was a mistake on his part.

Q. 183. The outer circumference of the sawed-off portion, which has been put in evidence as "Exhibit prolongation of rim E of instrument C," does not now seem to be quite as large as the portion of the rim E shown in "Exhibit C drawing." How do you account for that?

[*Witness, before answering, takes the case D and the sawed-off portion in his hand, and separates the rim E from the case D, and then slips the sawed-off portion on to the case D in place of the rim E; after which he places the rim E at the end of the case thus arranged; and then says:*]

A. I see I have reversed the way in which it was done. The arrangements that I stated before were correct as to the position in which the diaphragms were placed. But when I sawed the rim E in two—as it was originally—the outer portion sawed off, I then placed to the inner portion of the case, on the part marked D, and it is that piece which is marked E in "Exhibit C drawing." The intermediate part of the rim was removed, and it was that part which forms "Exhibit prolongation of rim E of instrument C."

The description in my answer one hundred and eightieth is correct, with this explanation.

Q. 184. As I understand your description of the completed instrument "C," it had a case with a mouth-piece, a German silver diaphragm with an armature attached at its center, an electro-magnet, the poles of which nearly, but not quite, touched the armature, and a permanent horse-shoe magnet, the poles of which were in contact with the cores of the electro-magnet at their heel end; and this instrument was used both as a transmitter and a receiver. Is my understanding correct?

A. Yes, sir.

Q. 185. How correctly is that instrument, when so constructed, represented in the drawing, "Reproduced C drawing?"

A. It is exactly the idea, with the exception that occurs to me that the permanent magnet is represented as a little larger than that on the original instrument; and the coils and core of the electro-magnet are shorter here in the drawing than in the original. That is to the best of my recollection.

Q. 186. At the time when you were painting Mr. Jacob M. Sadler's wagon, as you have testified, was the instrument then in the condition shown in "Exhibit reproduced C drawing," or was it in its earlier form?

A. I think it was in the form that is now here represented in the drawing; to the best of my recollection it was.

Q. 187. When you used that instrument as a receiver, in connection with "Exhibit F," as a transmitter, did you use them in the same kind of a closed electric current as you have heretofore described, as the circuit in which you used "Exhibit F" and the old cup transmitter?

A. Yes, sir; I always used them in a closed circuit.

Q. 188. What results did you get with the tumbler instrument as a transmitter and the instrument "C" as a receiver at that time?

A. Better results than I had in any former receiver.

Q. 189. Please state how you tested it to ascertain its results—how frequently, &c., and whether the two instruments "F" and "C" successfully transmitted and received spoken speech or not.

A. I tested it by having some one to speak or make some sounds in the tumbler instrument "F," while I would listen at instrument "C." I also placed or held the transmitter "F" in the neighborhood of a clock, while some one else would listen at "C" and hear the ticking of the clock. I distinctly heard spoken words through the instrument. I couldn't positively state how often—a great many times.

Q. 190. Did you hear whole sentences through the instrument as thus used or not?

A. Yes, sir; I often had persons to speak to me, and when they would come to me, I would repeat to them what words or sentences were spoken, and they would pronounce them correct.

Q. 191. Did you ever hear whole sentences that they spoke through these two instruments?

A. Yes, sir; though the instrument "C" was used more as a transmitter than a receiver—that is, with other instruments.

Q. 192. Did you hear spoken speech through those two instruments "F" and "C" when used together, at as early a time as when you were painting Mr. Sadler's wagon, or before that time, or not?

A. Yes, sir; before that time; but the exact length of time I couldn't state positively.

Q. 193. Is Mr. Sadler living or dead?

A. He is dead; he died about a year ago—nearly that, I guess.

Q. 194. Please look at the drawings marked "Exhibit I drawing" and "Exhibit reproduced I drawing, No. 1," and "Exhibit reproduced I drawing, No. 2," and state what they represent.

A. The "Exhibit reproduced I drawing, No. 1," represents an instrument made for a receiving instrument, and made by me.

"Exhibit reproduced I drawing, No. 2," represents a modification of the same instrument.

"Exhibit I drawing" represents the case of the original instrument.

Q. 195. When did you first have that original instrument, and for what transmitter was it specially made to be used as a receiver?

A. It was made after "C," but the length of time I couldn't possibly state; it may have been a year. It may have been made before Sadler's wagon was painted, and it may have been made after; I am not positive as to the time. It was used as a receiver in connection with instrument "C" as a transmitter. It was specially made to be used as a receiver with instrument "C" as a transmitter.

[*Mr. Hill puts in evidence instrument marked "I," to be designated as "Exhibit I," and states that the works inside of the case have been put in during the taking of the testimony for defendants in this cause; said works not being in the case at the time when the instrument was marked by the examiner for identification.*]

Q. 196. Please state whether the case and top or cover of "Exhibit I," are the identical case and cover originally used with the instrument "I," above referred to by you.

A. Yes, sir; the same case and cover.

Q. 197. Which form of the instrument was first made by you—the one shown in "Exhibit reproduced I drawing, No. 1," or the one shown in "Exhibit reproduced I drawing, No. 2"?

A. The one represented by "Reproduced I drawing, No. 1."

Recess for dinner until 2 o'clock, P. M.

December 10, 1881, 2 *o'clock*, P. M.

Examination resumed pursuant to adjournment.

Present same counsel except Mr. Smith.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 198. Will you please describe the instrument that is represented in "Reproduced I drawing, No. 1"—the older or original form of instrument—referring to the drawing, for letters of reference, if you prefer.

A. A represents the body of the instrument. The lower portion of the body of the instrument, not including the cover or top, is composed of two parts: the lower portion is a hollow or recessed cap; the portion above that would be a hollow cylinder with a flange at its lower edge fitting into a recess in the lower cap. At the upper edge of the hollow cylinder, there is a flange to fit a recess in the top cap-piece, or mouth-piece—as I am in the habit of calling it—for the purpose of holding the cap or mouth-piece in its place. At the upper edge of said cylinder there is a groove on the inside of said cylinder, for receiving the diaphragm. A space is left above the diaphragm for the reception of a paper gasket or ring. In the center of said diaphragm is secured by a screw, an armature, on the under side of the diaphragm. At the bottom of the lower cap-piece is secured an electro-magnet, by a screw fastening into the heel-piece of said magnet, the cores of said magnet coming into close proximity to said armature.

The extremity of wires of electro-magnet pass out of two holes made through the sides of the cylindrical piece above mentioned, and are held in position by two wooden plugs.

In the instrument, when originally made, those holes in the side were provided with screw-posts, where now the wooden plugs are.

Q. 199. In all the telephones that you ever made, from first to last, what kind of a circuit was used—closed or open?

A. A closed circuit, always.

Q. 200. In all the telephones that you ever made, from first to last, was the armature of the diaphragm in contact with the poles of the electro-magnet or not? Or was it intended to be so near the poles of the electro-magnet as to touch said poles when vibrating or not?

A. No, sir; they were not intended to be so close as to touch when vibrating.

Q. 201. Referring now again to the original instrument "I," as you have described it, and as it is shown in "Exhibit reproduced I drawing, No. 1," I understand you that this instrument was used as a receiver with "C" as a transmitter. Am I correct?

A. Yes, sir.

Q. 202. When you used the two instruments "C" and "I" together in that way, what results did you get and how satisfactory were they?

A. I heard words spoken through the instrument and understood what was said through the instruments. I heard sounds of different kinds made through the instruments, and could hear distinctly the different kinds of sounds through them. The results, as I remember now, were satisfactory, and better than the results with the tumbler and "C." I am confident that it was better than the original tumbler and "C" instrument.

Q. 203. How did the results, when using "C" and "I" together, compare with the results when using "F" and "B" together?

A. When using "I" and "C" together, it was much more satisfactory—louder—entirely better.

LEPHONE COMPANY,-2

Q. 204. Was the instrument "C" the first magneto transmitter which you ever made?

A. Yes, sir; to the best of my recollection, it was.

Q. 205. If I understand you, you invented the carbon transmitter first, and invented the magneto transmitter secondly, or as an improvement upon the original invention. Am I correct in that?

A. Yes, sir.

Q. 206. Did you test the two instruments "C" and "I" together, in the same way as you had tested "F" and "B," or "F" and "C"—that is, on similar lines or circuits, and with as great variety of experiments or tests at that early period to which you have been referring?

A. Yes, sir; to the best of my recollection, I did.

Q. 207. You have stated that the instrument illustrated in "Exhibit reproduced I drawing, No. 2," was a modification of the original instrument "I." Please describe in what the modification consisted.

A. The modification consisted in applying a double permanent magnet to the heel of the electro-magnet, instead of the heel-bar.

Q. 208. How did the instrument operate, and what was it used for, after the modification had been made in its construction?

A. It was a better instrument. It answered better as a receiver, and it could be used as a transmitter, and I have used it as such.

Q. 209. How long was it after the original instrument "I" was made before you made that modification?

A. I could hardly say. It may have been a month or several months. It may have been six months or perhaps a year. I can't get at it very clearly.

Q. 210. Have you any recollection whether that modification was made before or after the Haucks purchased the faucet business, in July, 1873?

A. I believe it was before.

Q. 211. The original instrument "I" and the modification which you have described both contain a top cover or mouth-piece of considerable height above the diaphragm. Did you ever modify the shape or height of that top cover? If so, how?

A. Yes, sir; I did. I made another, much lower from the opening or mouth-piece—that is, the mouth-piece was closer to the diaphragm—less space inside, than was in the older cover or mouth-piece.

Q. 212. Please look at the mouth-piece which I now put in evidence, and state whether it is or is not the identical modified mouth-piece and cover to which you refer.

A. It is.

[*The examiner marks said mouth-piece and cover "Exhibit 1 modified mouth piece."*].

Adjourned until December 12, 1881, at 2, P. M.

December 12, 1881, 2 *o'clock*, P. M.

Examination resumed pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 213. Have you any recollection when you modified the shape of the cover or mouth-piece, by making it lower, like "Exhibit modified mouth-piece," or how long was it after you made the original instrument "I?"

A. I do not recollect; in working on those modifications or changes, I did not charge my memory with the time. I cannot give the length of time.

Q. 214. What was your object in making the mouth-piece lower than it had been before?

A. I suppose it was on account of some other modifications that I had made in some instruments before; in reducing the space between the mouth-piece and the diaphragm, I thought I got better sounds; that is, I thought it gave better results.

Q. 215. In what instrument before?

A. I had made modifications in the tumbler instrument; that is, I had made the space smaller between the mouth-piece and diaphragm, and also in instrument "C"; but in them I did not come down to the extreme change, as I did in this, [*referring to "Exhibit modified mouth-piece."*]

Q. 216. Are the electro-magnets now in "Exhibit I" the same that were formerly used there, in the instrument, when you were operating it?

A. I think so; that is, in making search for the magnet—there were a number around the shop there, and this one exactly fit the recess provided for the bar, in the bottom of the box, and the cores were of the right length — suited to the armature of the diaphragm.

Q. 217. In the modification shown in "Exhibit reproduced I drawing, No. 2," how were the poles of the permanent magnets arranged?

A. There were two horse-shoe magnets, their ends or poles were halved, and their poles placed together; that is, south pole of one was placed to south pole on the other. The electro-magnets were placed, one to each compound pole, secured by a screw through the permanent magnets into the cores of the electro-magnets.

Q. 218. Originally you seem to have used plaster-of-Paris lining to the cover of instrument "I." Was that continued after the modified cover, here in evidence, was applied or not?

A. No, sir, it was not. I discovered, at a time, that it did not amount to much; I could not see that it was much benefit to the instrument.

Q. 219. The drawing "Exhibit reproduced I drawing, No. 1," shows a diaphragm with four holes in it. Was that the way you made and used your diaphragm in that instrument?

A. I think that was the way I made it in the former stage of the machines I had—that is, in a number of instruments.

Q. 220. How did that work?

A. I don't think there was any gain by having it in that way. I don't remember of noticing any difference.

Q. 221. In instrument "C," the diaphragm appears to have been corrugated concentrically. Is that the fact, that it was so made and so used at the time when the metal diaphragm was used on said machine originally?

A. No, sir; I don't think it was just immediately; that was an experiment. I found in former machines it was necessary to dampen them by pressure, and the corrugations would give it more stability—make them more rigid; but I don't suppose I used the diaphragm long till I did make the changes.

Q 222. Did you find that the corrugation of the diaphragm was of any practical benefit or not?

A. It was, in this diaphragm, I think.

Q. 223. Was this particular diaphragm made of exceedingly thin metal?

A. Yes, sir; it was termed plating—material used for covering iron by plating; it was much thinner than tin.

Q. 224. Please look at the instrument that I now put in evidence, to be marked "Exhibit A," and state what it is and who made it.

A. It is a telephone receiver. I made it.

Q. 225. Was that made before or after "Exhibit C" and "Exhibit I," about which you have testified?

A. It was made after them.

Q. 226. Is this instrument, which is now put in evidence, in exactly the same form in which it was originally made by you?

A. No, sir, it is not. In its original state the mouth-piece was in the center. There was no screw in its center, as this one now has alongside of the mouth-piece.

Q. 227. How long do you think the instrument was in that original state, with the mouth-piece in the center, before you changed it by putting the mouth-piece at one side of the center?

A. I could hardly tell how long I used it in that way. It might have been a year, or it might have been two or three months; I can't tell the right time.

Q. 228. Why did you change the mouth-piece to the side and put the screw at the middle?

A. I did that for the purpose of making it more rigid. It seemed too flimsy—vibrated too easily, or produced jars, I might say. I mean, make the diaphragm more rigid; in that change I placed in the center of the diaphragm a piece of soft rubber. The brass screw that runs through the center of the upper lid rested on the upper side of that rubber, the mouth-piece was changed to one side to accommodate the screw.

Q. 229. Did you find that this rubber pad and dampening screw benefitted the instrument or not?

A. I thought it did at the time benefit it to some extent.

Q. 230. What transmitter did you use this instrument "Exhibit A" with, when you first had it in the present form with the mouth-piece at one side, and before that time?

A. I used it with both these instruments, "C" and the tumbler instrument, "F." The best results were with the tumbler.

Q. 231. What use did you make of the instrument "Exhibit A?" What was done with it and how satisfactorily did it work?

A. I thought then it was a pretty good instrument; though it wasn't as good as that instrument there, [*indicating* "*I*"] in its modified form with the permanent magnets--wasn't as loud. I used it as a receiver. I couldn't enumerate all the different sounds I made through it. I made all the sounds through it that I could think of. I whistled, sang and talked through it; and I remember, too, I got a party to play a jew's-harp and I heard that through it distinctly.

Q. 232. Was it used on the line wires that you had up in the shop there, with a transmitter in some other part of the shop, or on some other floor or not?

A. Yes, sir; it was used on different lines that I had in the shop with transmitters. The transmitters were in different places; in the cellar and in different rooms upstairs. There were transmitters in different rooms upstairs at different times, and the instrument "A" down-stairs in the story below.

Q. 233. When talking through the instrument, how satisfactorily did it operate? State how clearly you could hear; whether you could hear a whole conversation, or extended remarks or not.

A. I could distinctly hear all words spoken; often whole sentences.

Q. 234. Could you hear whatever was talked into the instrument or not?

[*Objected to by Mr. Storrow as leading.*]

A. Yes, sir, I could. As far as I can remember, I thought it satisfactory—good, as near as I can remember.

Q. 235. Did you talk to a good many different people through this instrument "A," or not?

A. Yes, sir; I did.

Q. 236. After you put in the central dampening screw and changed the mouth-piece or ear-piece to one side of the center, did you ever make any further changes in the construction of this instrument "A" or not?

A. I do not remember of any other changes.

Q. 237. Was that the only change you made in the instrument "A" after it was first made--that putting in of the central screw and moving the ear-piece to one side?

A. I think I made some changes in the diaphragm; that is, in the way of thickness. I was in the habit of changing the diaphragms in all the instruments. That is all the change I can remember.

Q. 238. The mouth-piece was changed to one side at the same time when the central dampening screw was put in, was it?

A. Yes, sir; I moved the mouth-piece for the purpose of getting room for the screw.

Q. 239. Please describe the construction of the instrument "A" as it was when you had it fully completed and perfected; and you may refer to "Exhibit A drawing," by way of illustration, if you choose.

A. A on the drawings represents a hollow circular chamber. At the upper edge of the opening, there is a hollow recess for the reception of a thin wooden diaphragm C, which is kept in place by an upper cap B, secured by brass screws.

On the outside of the circular chamber A is secured a curved brass bracket F, secured to the back of the instrument by screws *f*.

Towards the opposite end of the bracket is fastened to it the electro-magnet D by a screw f^2; said electro-magnet passes through an opening in the back of the instrument or case A.

On the center of the under side of the diaphragm is secured an armature of soft iron *d*, which is immediately above the poles of said magnet, not quite touching them.

Through the cover B passes a brass screw B′, which comes in contact with a piece of soft rubber, placed on the center of the diaphragm on its upper side; said cover is provided with a mouth-piece or ear-piece I.

H H are two binding posts secured to and passing through the case A. The large screw G is for adjusting the electro-magnet closer to or farther from the armature.

The current passes into one of the screw posts; then to one end of the conducting wires; thence around the cores; then to the opposite end of the wire of coils, to the other of the binding posts H.

Q. 240. I observe that a small portion of the spool in the machine, "Exhibit A," has been broken off and lost. State whether this breaking has recently occurred, since the taking of testimony in this case.

A. Yes, sir. I think there was a small portion broken off before, but not as large a piece. I think the larger piece was broken off since.

Q. 241. Can you fix the time when you first made this instrument "A" or when you first put the mouth-piece at one side of the center?

A. I cannot possibly say. I know it was after I made this instrument, [*indicating* "*Exhibit C*,"] but the length of time between those two I couldn't possibly give. I can't remember the length of time.

Q. 242. Mr. Jeremiah Kohler, a witness who has been examined for the defense in this case, testifies positively, on page 567 [544] of defendants' printed record, that he saw you working at and making this machine, "Exhibit A," some time between April, 1873, and April, 1874. State whether there is or is not anything within your knowledge that would lead you to doubt the accuracy of Mr. Kohler's statement.

[*Objected to as incompetent.*]

A. There is not—nothing that would lead me to doubt the statement. It may be that I made it as early as then; I cannot recollect.

[*Counsel for Defendants offer instruments "D" and "E" in evidence, to be marked "Exhibit D" and "Exhibit E," respectively.*]

Q. 243. Please look at these two instruments which I have just put in evidence, and state who made them, or under whose direction they were made?

A. They were made under my directions. Part of them I made and parts of them were made by Harman K. Drawbaugh.

Q. 244. Please explain the construction and mode of operation of the instrument "Exhibit D," referring, if you choose, to "Exhibit D drawing," by way of illustration.

A. It is composed of a wooden casing A and cap B, with mouthpiece B′ in the cap.

An electro-magnet C, and a permanent magnet D, one of the poles of which is secured to heel of electro-magnet.

Said electro-magnet consists of a single core and coil, and passes through an opening in the center of body A of instrument.

In a recess, at the inner upper edge of A, is placed a diaphragm G. Said diaphragm is held in place by the cap B, which fits a recess at the outer and upper edge of body A.

The core of the magnet is bored out for the reception of soft iron plugs, *c′* and E. The plug *c′* is attached to a small screw F, which passes through the plug E, at the heel of the electro-magnet, for the purpose of adjusting said plug *c′* closer to and farther from diaphragm G. There is a small jamming nut *e* for the purpose of holding screw F to its place when rightly adjusted.

Q. 245. Do you remember which of those two instruments, "D" and "E," was made first?

A. I don't know which. There was one of them made first, but which one I couldn't tell; they are so nearly alike.

Q. 246. Were they made before or after instrument "A"?

A. They were made after instrument "A."

Q. 247. Did the instrument "D" ever have a bottom cover or cap covering the permanent magnet, the same as "E" has?

A. Yes, sir.

Q. 248. What was the instrument "D" used for—transmitting or receiving?

A. It was used for both transmitting and receiving, but it was used first as a receiver, in connection with these other transmitters.

Q. 249. Did it have the permanent magnet when it was first made?

A. Yes, sir; it was a modification of the instruments that had been made before that.

Q. 250. Please describe the instrument "Exhibit E," referring to "Exhibit E drawing," by way of illustration, if you choose.

A. It is similar to "Exhibit D" in all respects, with the exception of the bottom cap C.

Q. 251. Did the original instrument "Exhibit E," or did it not, contain an adjustable plug and adjusting-screw therefor, corresponding to the adjustable plug *c′*, and its adjusting-screw F, in "Exhibit D" and "Exhibit D drawing?"

A. Yes, sir; it did.

Q. 252. What became of that plug and adjusting-screw of instrument "E?"

A. I can't say. It was lost in some way—became detached and was lost, I guess.

Q. 253. Were both these instruments, "D" and "E," used as transmitters and receivers in their early days?

A. Yes, sir; they were used together, one as a receiver and the other as a transmitter, and they were used with carbon transmitters, both as receivers.

Q. 254. With the exception of the removal or loss of the little plug *c′*, and its adjusting screw F, in "Exhibit E," and the removal or loss of the rear cap or cover of "Exhibit D," are these two instruments, "D" and "E," in the same condition as when they were first made, or not; and if not, what difference?

A. They are, to the best of my knowledge, except that, at a time afterwards, I made a little change in the body A of instrument "D." There is a recess in instrument "D" immediately below the diaphragm, around the upper edge of the coil of the electro-magnet which was cut in some time after the instrument was first made; with that exception, it is the same.

Adjourned until December 13th, 1881, at 10, A. M.

December 13, 1881, 10 *o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present, same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 255. What was your object in making that recess?

A. Intended for a trial to see whether it would be an improvement. It occurred to me that it would give more space for vibration of diaphragm; that is, it would allow more elasticity for the air.

Q. 256. What was the result of putting that space in there? What effect had it on the operation of the instrument?

A. I don't think there was any improvement; that is, there was no perceptible difference between the two machines after trying it. I mean the two magneto instruments, "D" and "E."

Q. 257. In the two instruments "D" and "E," as they are at present, the cores and electro-magnets and permanent magnets are all somewhat loose, so as to slip in and out unless carefully handled. Was that so originally, or is it the result of wear and rough usage?

[*Objected to by Mr. Storrow as leading.*]

A. It was not so originally. They became so by careless handling.

Q. 258. State whether or not the handling during the taking of testimony in this case has increased that looseness.

A. Yes, sir.

Q. 259. To what extent did you use the instruments "D" and "E?"

A. I used them very often. I couldn't state how often.

Q. 260. Did anybody talk through them or listen through them besides yourself?

A. Yes, sir; a great many persons. What I mean by that is, a great many persons who come to the shop there.

Q. 261. How satisfactorily did these two instruments work?

A. I considered they worked well. Persons listening could hear all that was spoken through them.

Q. 262. How far were they tried apart?

A. I tried them on different lines in the shop—about the same as I did the former instruments.

Q. 263. Referring now to your magneto transmitters, "C," "I," "D," and "E," how did you use them—with a battery or without, when transmitting by them?

A. Without a battery, when using for transmitting.

Q. 264. Did you ever try them with a battery?

A. Yes, sir; I did.

Q. 265. Mr. Harman K. Drawbaugh, a witness heretofore examined for Defendants, has testified, on page 579 [555] of defendant's printed record, that these instruments "D" and "E" were made in January or February, 1875, before the Axle Company received its new machinery in March, 1875. Have you any recollection of the fact or not?

[*Objected to by Mr. Storrow as leading and incompetent.*]

A. I have no recollection of the time, but I recollect of him working on the machine; one of them was made before that time. What I mean is, there was one of them made, and Harman made, or helped to make, the other. It has been quite a long time ago. I can't remember the year or date of it.

Q. 266. Have you any recollection of putting a line of wire up from the third floor to the garret or fourth floor, and winding it back and forward on the garret several times, from one end of the building to the other, to gain length or distance, and then taking it down to the cellar and using those two instruments "D" and "E" upon it?

[*Objected to as leading.*]

A. I remember of having a line from the cellar to the garret. I don't remember just in what way I had it arranged on the garret; at different times I had coils of wire in the garret. I may have run it back and forward with those coils; that was at a pretty early period. I had lines arranged in so many different places in the shop that I can't remember every particular arrangement. When I say coils of wire I mean rolls of wire. I do not mean coils for a magnet.

Q. 267. Please look at the instrument "H," which I now put in evidence, to be marked "Exhibit H," and state what it is and who made it?

A. It is a telephone transmitter. I made parts of it; parts may have been made by some other parties; I don't remember who, but I

EPHONE COMPANY,-2

often had George W. Drawbaugh to help me make some of the instruments.

Q. 268. Do you recollect when this instrument was made so as to fix the time?

A. Not positively. I don't know any date particularly.

Q. 269. Several witnesses have testified to seeing this machine either completed or in process of completion in the fall of 1876. What is your recollection as to that fact?

[*Objected to by Mr. Storrow as leading and incompetent.*]

A. The time elapsed—just judging the time, it may be at that time, or before. I had been making a good many of them. I paid no attention to the time. It has slipped my memory.

Q. 270. Please explain the construction of the original instrument "H," referring to the drawings "Exhibit H drawing, sheet 1," "Exhibit H drawing, sheet 2," and "Exhibit H drawing, sheet 3," by way of illustration.

A. A represents a wooden box and B is the door; on the inside of the door is a cast-iron open ring D; on the inner edge of the ring is a circular groove; in said grooves is placed a sheet-iron diaphragm F.

The diaphragm is held in place by a gasket f, of paper or gum, I don't remember which; on that is placed a brass ring f', to secure and hold both the diaphragm and gasket to their place.

At the upper side of cast-iron ring is secured a brass bracket. At the upper end of said bracket is placed a wooden block g', used as an insulator.

At the outer side of block g' is placed a brass spring D', which is screwed to the brass bracket by two screws g^2, passing through the brass spring and the wooden block and into the bracket.

The screws g^2 are insulated from D' by hard rubber rings or washers, g^3.

About the center of the brass spring D' is an opening through said spring and directly opposite the center of the diaphragm. A little way above the center of said spring is secured another thin brass spring D^2 by a screw d.

At the lower end of said thin spring D^2 is secured a brass cup d^2, by means of a screw, said cup containing a carbon block or ball d^3.

Immediately opposite said carbon block and brass cup is a wooden tube I^2, secured to a brass spring E about centrally between brass spring D′ and diaphragm, said spring extending out past metal ring D, and secured to the lid or cover of the box by a screw *e′* passing through a small wooden block *e*.

On the center of the diaphragm is another brass cup I, which contains another carbon block I′.

In the before-mentioned wooden tube I^2 were carbon blocks placed. At different times I changed the number of blocks in said tube; sometimes I had one, at other times two, three, or four; I can't remember the exact number. At the lower end of spring D′ is placed a brass milled head-screw H, the thread on the end of which is fitted to the cast-iron ring D. Said screw was for the purpose of adjusting spring D′ closer to and farther from the diaphragm, and thus compressing more or less the carbon blocks.

A conducting wire *h′* is secured to the diaphragm by solder, close to brass cup I, which is carried on the diaphragm. Said wire passed to one end of the primary wire of the induction coil J; then passed out or from the other end of primary of induction coil to a binding post on top of instrument to the right of the bell. This binding post is not on the instrument now.

Another conducting wire is secured to the upper end of spring D′ by means of solder, then passes to another binding post at upper left-hand side of the case, near the top. This binding post is also now removed.

The secondary helix of the induction coil is connected as follows: One end to one of the binding posts K^3 and the other to the other of the binding posts K^3.

Each of said binding posts was provided with two binding screws for securing two wires to each post; one wire was for the line wire and the other was for the receiver.

There was an alarm mechanism upon this instrument.

A brass screw L was for securing one end of a switch lever; said lever extending down some distance to either of two brass plugs L^2.

When resting against one of those plugs, the primary current passed or was conducted through the line wire, for the purpose of signaling the opposite end of the line. When switched on the other, the primary circuit passed through the carbons.

On the inside of case, near the upper left-hand corner, was secured an electro-magnet by a brass plate L^3, by means of a brass screw *l*. The electro-magnet is now missing.

In front of said electro-magnet, close to its poles, is secured a soft iron armature M, by means of a brass plate pivoted at *m*.

At the upper end of armature was secured a brass rod, at the upper end of which was secured a small metal hammer, which is now missing.

At the side of it was a gong-bell C, upon which it was to strike.

Said bell was secured to a wooden bracket C′.

A spring G secured wooden block G′. Said block was fastened to cover or door; I think it was glued on. Said spring rested against the diaphragm between the center and the outer edge. Originally this spring was of brass, and a conducting wire *h′* was secured to the lower end of said spring and used as a conductor between the diaphragm and the primary of the induction coil. That was the original construction, and in that way it answered the two purposes of a dampening spring and a conductor.

Recess for dinner, until 2 o'clock, P. M.

December 13, 1881, 2 *o'clock*, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Mr. Daniel Drawbaugh by Mr. Hill continued:

Q. 271. Did you ever use this instrument "H" for talking through a telephone line at your shop? If so, to what extent?

A. I did, on various lines; that is, through various portions of the shop; from the cellar to the second story; to different rooms in the shop. I used it also to a line that I put up, that extended down the Yellow Breeches creek.

Q. 272. How did the instrument "H" work? What degree of satisfaction did it give?

A. It worked very well; much better than some others that I had; better than any other that I had prior to that time.

Q. 273. How long was your line that you established down by the creek?

A. I would judge it to be in the neighborhood of a hundred yards—may be more, may be less; I would suppose it to be more.

Q. 274. Did you talk through the instrument "H" to others, or have others talk through it to you?

A. Yes, sir; I have talked to others, and others have talked to me.

Q. 275. What receivers did you use with it, when talking or listening?

A. All the receivers that I had previous to that.

Q. 276. How plainly could you hear and understand, through the receivers, what was spoken at the other end of the line "H"?

A. I could understand very distinctly everything that was spoken through the transmitter "H."

Q. 277. Has this instrument "H" been altered any since it was first made or not?

A. It has, to some extent; the bell was put on some time after it was first used, and there were changes in diaphragms. Some time after it was made I had a corrugated diaphragm, I know. I don't remember the number of different diaphragms. There was also a change in the dampening spring. It was first of brass, and then changed to steel.

Q. 278. Have you any idea how long the bell was put on after the instrument was otherwise finished?

A. I don't remember the length of time. It may have been some months, perhaps.

Q. 279. What difference did the changes of the diaphragm make in the working of the instrument?

A. I remember the first diaphragms were thinner, and after replacing with a thicker diaphragm, it worked better--considerably better, as near as I can remember now.

Q. 280. How long before you replaced it with a thicker diaphragm?

A. I couldn't state how long. I made some changes in the diaphragm shortly after I made the machine.

Q. 281. How did the change in the dampening spring and the electric wire, which was attached to it, affect the operation of the instrument, if at all?

A. I don't know that it was any particular change in the effect. I made that change for the purpose of getting a metallic connection; that is, the other spring, resting on the diaphragm, would oxidize, and it occurred to me that that might lessen part of the current.

Q. 282. In this instrument "H," could you adjust the carbons to such a degree of contact pressure as to fulfill all the requirements of the instrument for a transmitter or not?

A. Yes, sir.

Q. 283. What kind of carbons did you use in the instrument?

A. I generally used carbon that I got out of the bottom of gas retorts, where the carbon accumulates. I got it at Harrisburg; just lying in the yard—just picked it up. I also used others, cut out of coke, but found that had a tendency to wear away, being too soft. I also made carbons out of charcoal myself, which, to the best of my recollection, I used. I pulverized charcoal and made it into a thick paste and compressed it; then covered it with a mortar of clay and heated it in the fire to a white heat. These carbons varied in hardness.

Q. 284. What kind of carbon did you first use on this instrument "H?"

A. To the best of my recollection, the softer carbons, made of coke.

Q. 285. Did you find these softer coke carbons wear out?

A. I can't just say that they wore out; they wore off. I can't just say I discarded them for that reason. I found the harder carbons answered a better purpose.

Q. 286. Was this the first telephone that you ever made with an alarm bell on top of it?

A. Yes, sir; I think it is.

Q. 287. Have you ever made one with an alarm bell since you made this?

A. Yes, sir; several.

Q. 288. When did you make those several—some time ago, or recently?

[*Objected to by Mr. Storrow as leading and incompetent.*]

A. Within the space of two years, as near as I can recollect.

Q. 289. This instrument contains an induction coil. Did you ever use an induction coil in connection with your telephones before you made this instrument "H?"

A. I did, but they were not connected with the instrument. That is, I tried them with other instruments, but the coils were lying loose upon the table. The primary current passed through the coil and the secondary to the line. If I am not mistaken, this same coil had been used in just that way, before it was placed in this box, [*referring to induction coil in instrument* "*H.*"]

Q. 290. Have you any idea how long you had so tried the induction coil, before you made this instrument "H?"

A. I could hardly state how long. It might have been two, three, four, five or six months; maybe more.

Q. 291. Do you remember what instrument or instruments you tried it with before you made "H"?

A. Yes, sir; but I can't designate the instruments without seeing them.

[*Witness looks through the photo-lithographs, and then pointing to figures of instruments "L" and "M," continues his answer.*]

Those are the ones.

[*Defendants' counsel put the instruments "L" and "M" in evidence, to be marked "Exhibit L" and "Exhibit M."*]

Q. 292. Please look at the drawings marked "Exhibit reproduced L drawing" and "Exhibit reproduced M drawing," and state whether they are or are not correct drawings of those two instruments, as they were originally made?

[*Objected to by Mr. Storrow as leading and incompetent.*]

A. Yes, sir; they are, as near as I can judge from the drawings.

Q. 293. Were those instruments "L" and "M" made before instrument "H"?

A. Yes, sir.

Q. 294. How long before?

A. I could hardly state that; it may have been six months; I don't know—may be more. About that time I was making different ones, and I don't remember the time that elapsed between them.

Q. 295. Were these instruments "L" and "M" made before or after the little magneto-instruments "D" and "E"?

A. After, to the best of my recollection.

[*Mr. Hill offers the instruments "G" and "O" in evidence, to be marked "Exhibit G" and "Exhibit O," respectively.*]

Q. 296. What are these two instruments "G" and "O," and who made them?

A. They are transmitting instruments. I made them.

Q. 297. Were these two instruments "G" and "O," or either of them, made before instrument "H" was made, or not till after?

A. They were made after the instruments "L" and "M." I think, to the best of my recollection, that they were made before "Exhibit H," but I won't be positive about that; there were so many that I have lost the exact order. I am positive that they were made after "L" and "M."

Q. 298. Who made "L" and "M," and what were they intended to be used for?

A. I made them; to be used as transmitters and also as receivers.

Q. 299. Did you ever use them together, one as a transmitter and the other as a receiver?

A. Yes, sir.

Q. 300. What other instruments that you have testified about did you ever use them with, or either of them?

A. I suppose I have used them with all prior instruments; I mean all instruments that could be used. They were intended to be used together, one as a transmitter and the other as receiver. In that way, I suppose, they were used the most.

Q. 301. How did they work?

A. They worked very well.

Q. 302. Did you ever talk through them, or hear anybody talk through them?

A. Yes, sir; often.

Q. 303. Could you hear and understand everything that was said through them or not?

A. Yes, sir; to the best of my recollection, I could.

Q. 304. Did others hear and understand what you said through them?

[*Objected to by Mr. Storrow as hearsay.*]

A. Yes, sir; I believe so. I spoke to others through them, and was answered back through them; for that reason I believe so.

Q. 305. Please describe the instrument "M" as it was originally constructed by you, using the drawings by way of illustration.

A. There are some parts not here; I will go and get them.

[*Witness returns with box of loose parts of instruments.*]

The original instrument "M" is shown in "Exhibit reproduced M drawing."

A represents the casing or body of the instrument; B a cover or cap of the instrument; D represents the electro-magnet; F represents the heel-bar of the electro-magnet.

In the center of the heel-bar, there was an opening for the reception of a tin tube. Said heel-bar was secured to the heels of the cores of the electro-magnet by screws.

At the top of casing A, on the inner edge, is a shallow recess for the reception of the diaphragm C.

To the center of the diaphragm is secured an armature I, by means of a brass screw, said screw being recessed on its under side for the reception of a brass rod.

At the bottom of said brass rod is attached a thin copper plate e^2, which fits inside of a wooden tube E, said tube fitting loosely inside of a tin tube, which served as a guide or holder. In one instrument there were a couple of small tin pieces serving as guides instead of tin tube.

In the wooden tube before mentioned, at its bottom, was another copper plate. Between bottom plate and top plate were placed carbon balls *e e e*.

To the center of the bottom copper plate is secured a conducting wire, which was bent over to the side at the bottom of the tube and extended out a little way, and played in the vertical slot in the side of the tin tub, which slot was made to accommodate the conducting wire; thence to one of the binding posts H.

Another conducting wire was secured to the under side of the diaphragm and extended to another of the binding posts H.

The current passed as follows: One end of one of the coils of the electro-magnet was connected to one of the posts H; the other end of that coil was connected to the next coil. The other end of that second coil was connected to the conducting wire, which was attached to the bottom copper plate e'.

Attached to the rod of the upper plate is a conducting wire secured thereto, and passing to the other binding post H.

G is a screw recessed in its center for the reception of a spring—either a spiral spring or a piece of soft rubber; I don't remember whether the spring or the rubber was the original form. Said spring rested against the under end of the wooden tube E, and was capable of pressing more or less against the tube by means of the adjusting screw G.

The spring is shown as a rubber block *g* in the drawings.

The construction of original instrument "L" was similar, with the exception of the dampening spring I, which is shown in the drawing.

I have described two kinds of connections, but it was intended that the current should pass through the carbons and through the coils.

I have made a good many modifications of these machines and changes of diaphragms. In some of them, the conducting wire was attached to the diaphragm, as I have above described. In all cases the current went through the coils; in the instance above, where I omitted to mention them, I ought to have put them in; there was a number ot modifications and experiments.

At one time afterwards I changed the carbon balls. I took this whole carbon business off, and put on two permanent magnets, allowing the same space between the electro-magnets.

And then, in one of the instruments, I took away the tube and balls and put a post in their place, which post passed up to the top to the diaphragm, and the center of the diaphragm was secured rigidly to this post.

The edges of the diaphragm were free to vibrate; I don't know whether that is described in the drawings.

Adjourned until December 14, 1881, at 10, A. M.

December 14, 1881, 10, A. M.

Examination resumed pursuant to adjournment, and
Adjourned until December 15, 1881, at 10 o'clock, A. M.

December 15, 1881, 10.30 *o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 306. Is the form of machine, which is represented in "Exhibit M drawing" and shown clearly in the lower figure thereof, the modification described at the last end of your preceding answer, and containing the post?

A. There is a post there, but it is not the one I referred to.

Q. 307. Describe the one you referred to. How did it differ from the post in this drawing?

A. In the drawing referred to, there is a portion of a post represented not connected to the diaphragm. The post or rod referred to first was secured to the center of the diaphragm by being riveted or soldered and then run down between the electro-magnets to the bottom screw F, and was fastened thereto.

Q. 308. The top of the post F, in the drawing, is provided with a screw-hole. If the diaphragm were secured to the top by a screw, would the arrangement then be the same as referred to as existing in the original instrument "M" at one time?

A. Yes, sir; it would produce the same results. I don't remember whether it was fastened with a screw. I thought it was soldered or riveted, but that would make no practical difference.

Q. 309. If I understand you correctly, the two instruments "L" and "M" were originally made, as shown in the drawings "Exhibit reproduced L drawing" and "Exhibit reproduced M drawing," and were afterwards changed to the forms shown in "Exhibit L" and "Exhibit M," and in the two drawings "Exhibit L drawing" and "Exhibit M drawing?"

A. Yes, sir.

Q. 310. As originally made, they could be used both as transmitters and receivers, could they?

A. Yes, sir; and after the other modification—after placing the permanent magnet—they could be used as transmitters or receivers.

Q. 311. Did you use them at any time, without the carbons and without the permanent magnets, merely as receivers?

A. I don't remember that I did. I may have, but I can't remember.

Q. 312. Have you stated all the modifications that you made in these two instruments "L" and "M?" If not, state any other modifications that were made.

A. No, sir; at sometimes I allowed the circuit to pass through both coils at the same time; that is, dividing the circuit into branched circuits, and placing one coil in each branch.

Q. 313. How did these two instruments work in these various modifications?

A. In this modification that I last referred to, I don't remember of noticing any difference. In the modification with the permanent magnets, they were a much greater improvement than before I used them —got better results—more practical.

I used it first, just as shown in "drawing reproduced M." Then I took off the heel-bar, and put on two permanent magnets in its place. They were bent magnets as shown in "Exhibit M;" in that form of that instrument I could use it better as transmitter and receiver. When using it this way, I had a battery. At one time I removed the carbons from one of these two instruments and substituted the post that I have described, and used this instrument so modified, with the other instrument, without modifying the other instrument. It is a little hard for me to describe it.

Then at a later modification, I took and closed them permanent magnets, so that they came closer, and would require shorter armatures. Then they were used as receivers, or as magnetos, as shown in "Exhibit L drawing."

The results of these modifications were not always the same. Some were better than others, but I had results in all.

Q. 314. In all the modifications could you hear and understand through the instrument what was said—spoken speech—or not?

A. Yes, sir.

Q. 315. What was your object in making these various modifications of these two instruments from time to time?

A. Trying to make a better machine and get better results. The modification shown in "Exhibit L drawing," I think, was made after instrument "Exhibit H," and used in connection with that instrument.

Q. 316. If your telephone was capable of transmitting spoken speech so as to be distinctly heard and understood before that time, why were you experimenting to get better results?

A. That is a question I hardly know how to answer. I was experimenting to get better and louder results. I may have had other reasons.

Q. 317. Are you still experimenting to see if you can get better results than anybody has gotten yet with telephones?

A. Yes, sir; I still am experimenting and trying to get better results

Q. 318. You think that the telephone, then, has not yet reached its highest possible perfection, do you, although hundreds of inventors have been working at it and hundreds of patents have been issued upon it.

A. I do think it hasn't got near to what it will yet.

Q. 319. Referring to "Exhibit L" and to "Exhibit L drawing," what was the purpose of the pressure spring *b*, and its adjusting-screw G?

A. Used as a dampening spring for preventing too easy vibration.

of the diaphragm. But I have now discovered that in using a thicker diaphragm I found it was not necessary to have a dampening spring, or in reducing the diameter it is not necessary.

Q. 320. In "Exhibit L," I observe you use a compound diaphragm. What was your object in trying that form of diaphragm?

A. I thought I could have better results. That is, I would get the vibration of two surfaces. That was a modification of some prior experiments; in the prior experiments I thought I got better results. I might refer you to instrument "C." In that instrument I had used two diaphragms and the one diaphragm—the inner one, next to the mouth-piece—had openings.

Q. 321. Referring to "Exhibits G" and "O," were those two instruments "G" and "O" made at the same time, or made to work together?

A. They were made pretty nearly the same time, I think.

Q. 322. Will you describe them as they were originally made and used, referring to the drawings "Exhibit G drawing" and "Exhibit O drawing?"

A. Yes, sir.

[*Instrument marked* "*G.*"] A is the body, or case, of the instrument; B top of instrument, or cap.

F is a carbon-holding tube of wood; J an adjusting-screw, recessed or bored out at screw end I, for the reception of a coiled spring. Sometimes I used a soft rubber block in place of the spring; in said wooden tube were placed carbon balls. The number I often changed at different times.

At the bottom, underneath the lower carbon ball, was placed a small copper plate G′, in the lower end of the tube.

In the center of the small plate is secured a conducting wire, which passes out of the wooden tube and passes to one of the screw cups or binding posts E.

At the upper end of the wooden tube is another plate G, secured to a small rod; diaphragm C rests in a groove at the top of the casing A, and is kept in place by the cap-piece B.

At the center of the diaphragm C is secured a small brass cup the lower end of said cup contains a cone-shaped opening for the reception of the upper end of the rod of the upper contact plate G.

To the rod before mentioned is secured another conducting wire, which passes to the other of the screw posts E.

The current passes into one of the screw posts E, then to one of the contact plates; through the carbon balls into the other contact plate; through conducting wire to the other of the screw posts E.

J, the adjusting-screw, is for compressing, more or less, the carbon blocks, so as to get the instrument into proper adjustment. The carbon blocks were used as low conductors, to modify the current, according to the different degrees of compression produced by the vibration of the diaphragm.

In this instrument "G," and in the drawing, there is nothing wanting but one or two of the carbons,—places for which are shown by dotted lines in the drawing.

[*Instrument marked* "*O.*"]

This instrument "O" was originally exactly the same as instrument "G." At an after-time I made a modification in it. Instead of the cone-shaped cup on the diaphragm to receive the end of the rod, was placed another brass cup *c*, holding a carbon block or ball *c′*.

At the bottom of the wooden tube, corresponding to carbon tube F in instrument "G," is a similar brass cup F, containing a carbon ball *f*.

The space between the ball *f* and the ball *c′* was filled with other carbon balls in contact with each other. I don't remember their number. They were provided with the same adjustment as in instrument "G."

The current went in the same direction as in instrument "G," with the exception that the upper conducting-wire was connected to the diaphragm, and the other conducting wire to the lower brass carbon cup F.

Q. 323. Were the two machines "G" and "O" used for talking telephonically?

A. Yes, sir; they were used as transmitters.

Q. 324. How did they operate—satisfactorily or not?

A. Yes, sir; they did.

Q. 325. Do you remember what receivers were used with them?

A. I couldn't remember all; but the instruments represented in "Exhibit L and M drawings" were used with them.

Q. 326. Do you remember whether the old tin can instrument "B," or the flat instrument "A," or the two magneto instruments "D" and "E," were used as receivers with them?

A. The two magnetos "D" and "E" were. I think "A" was, but I don't remember certainly. I don't remember whether "B" was or not. All that were in condition for use were used as receivers with them.

Q. 327. Was "A" out of condition for use at any time? If so, when and how?

A. I don't remember at any other time than when Mr. Knight was making drawings of it, and separated some of the wires.

Recess for dinner until 2, P. M.

December 15, 1881.

Examination resumed pursuant to adjournment.

Present, same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

[*Mr. Hill offers in evidence as "Exhibit J" the instrument which has been heretofore referred to as instrument "J."*]

Q. 328. Please look at "Exhibit J," and state what it is and who made it.

A. That is a telephone transmitter. I made part of it and was assisted by George Drawbaugh on parts of it.

Q. 329. Has this instrument ever been modified in its construction since it was first made, or is it the same, with the exception of wear and tear, as when it was first made?

A. It is the same as when it was first made, with the exception that it has been a little roughly handled.

Q. 330. Will you please describe the instrument and its mode of operation as originally made, referring to the drawings?

A. It is composed of a casing or box, A, and a front cover, B, hinged to said box.

On the cover of said box is a portion of the transmitting parts.

There is an oblong iron ring, C. On the inner side of that ring is a groove for the reception of an iron diaphragm, G, held in place by a brass wire oblong ring, F, which is secured in place by four screws marked *f* on the drawings.

In the center of the upper portion of the iron ring is connected to it a flange, forming part of said ring, extending up some distance and being provided at its upper end with a wooden insulating block, D^2 upon which is placed or secured two springs or levers, D D, secured by two screws d^2, one on each.

At the lower end of said springs or levers are two adjusting-screws *d d*, passing through them and screwing into another flange, C′, at bottom of ring; *c* are four screws for securing said iron ring to the inside of the cover of the box.

EE are two brass brackets secured to the side of the iron ring by two screws *ee*, and extending in towards the center of the diaphragm one from each side of the cast-iron ring C.

At the inner end of said brackets are secured two wooden tubes E′, one in each bracket for holding the carbon balls.

Immediately in front of said wooden tubes, secured to the diaphragm, are two brass cups OO^2 for holding blocks *oo′*.

The carbon cup O^2 on the left-hand side is fastened to a rubber strip or flange O′, which is secured to the diaphragm, so that the cup O^2 is insulated from the diaphragm.

There are two brass springs D′ fastened to spring levers D, some distance above the center of the diaphragm, by two screws *d′*; their lower ends are provided with two brass cups d^5, secured thereto by screws d^4.

Two carbon blocks d^6 are secured to said cups.

At the upper end of the brass spring levers are two switch levers D, secured by two screws or rivets d^3, to said brass spring levers.

D^4 are two circuit posts.

Within the interior of box A, at its lower side, are placed two induction coils H, held in place by two straps of tin *h*.

On the bottom end of said box are two switch levers J, and two contact plates J′, at the outer edge of the box; immediately above the induction coils H, are four switch levers I, I′, arranged in two pairs, either of the left-hand pair I, I′, can be brought into contact with the left-hand plate I^2; either of the right-hand pair I, I′, can be brought into contact with the right-hand plate I^2.

The two central levers I′, I^1, can also be swung so as to make contact with each other, as shown in the drawing.

On the outside of right-hand side of the box are two switch levers K, shown in the "elevation of right side," sheet 2. On that sheet each of them is shown in contact with its contact piece, which is shown by dotted lines passing through the side of the box at the extreme right-hand side of sheet 1; they are the two lower ones of the four shown on that side, which are in the side of the box directly under the knobs *k*. One of these levers is pivoted at the screw *k′*, and the other is pivoted at the upper front binding post on the side marked L.

The current from the battery comes in at the upper front post at the side, marked L, passes through the switch K, to its contact piece, which is underneath it in the drawing; from there, by the long wire shown on inside elevation, it passes to a contact plate T′, on the front right-hand corner of the bottom; then through the right-hand switch lever J; thence through switch lever J to the top of the right-hand coil H; then through its primary coil; from the other end of that primary a conducting-wire goes to the lower hinge *b*; then through a conducting-wire to the diaphragm, at a point marked P in the plan of diaphragm; then to the right-hand cup and carbon O, *o*, and through a number of carbon balls in the right-hand wooden carbon-holding tube E′; then to a carbon block d^6 secured to the cup d^5, then to right-hand spring D′; then passing to switch lever D^3; then to the right-hand conducting post D; then to the upper hinge *b*; then to either of two binding posts L, on left-hand outer side of the instrument, near the upper end; one of these is shown in a dotted line behind the cover, in the front inside elevation, sheet 1, and also in the outside front elevation.

There is another similar screw post on the same side directly behind it, not shown in any of the drawings. From those posts the circuit went to one of the poles on the battery; the other pole of the battery was connected to the binding-screw on right-hand side of the case, from which the circuit has been described as starting. Then completing the circuit inside and outside of the case.

The circuit for the secondary current induced by the primary above described runs as follows:

Starting from binding post L, at upper right-hand corner of case, by a conducting-wire, to contact plate I^2 on right-hand side of the back of the instrument; then through the corresponding switch lever I, and through its contact plate *i*; then by a short wire to the end of the secondary of the right-hand induction coil, then out of the opposite end of the secondary to the left-hand contact plate *i′*, and switch lever I′, to left-hand contact plate I^2; then by a conducting-wire to binding post L at left-hand back corner at top of instrument, thence to the main line and around through the main line back to the point of beginning.

The induction coil at the lower right-hand corner of the instrument can be disconnected, and the induction coil at lower left-hand corner of the instrument connected, as follows:

I will now describe how I set the switches to cut out the primary of the right-hand coil, and carry the battery current through the left-hand coil.

The upper front switch on the right hand of the outside is now swung off from its contact piece.

The right-hand switch J, at the bottom of the box, is now swung off from its contact piece J'.

The right-hand switch D^3, leading from the upper end of the brass spring lever to the upper right-hand contact post D^4, is now swung off from that post. This destroys the connections which formed the circuit as previously described. I will now make the connections to carry the circuit through the primary of the left-hand induction coil.

The circuit comes in at the upper rear post on the right-hand side on the outside of the box, shown in the elevation on sheet 2, passes then by a wire to the screw k', the inner end of which is shown on the inside elevation, sheet 2. This screw forms the pivot for lower rear switch K, through which the current passes to contact plug underneath the switch knob *k*. It is the lowest of the four screws which are shown in dotted lines passing through the extreme right-hand side of the box, in the front inside elevation on sheet 1. Thence through a conducting-wire to the primary of the left-hand induction coil, at a point which is marked "C P" on the instrument, but which is not marked on the drawings. The other end of the primary of that coil comes out at a point which is marked in the instrument "C S," but which ought to be marked "Z P." Then it comes out and connects to the left-hand switch plate J', on the left hand of the bottom of the instrument, by a wire, the whole of which is not now on the instrument, and which is not shown at all on the drawings. Then through the left-hand switch lever J, to its contact piece J'; then through a wire which goes to the cover of the box, where it is secured by a piece of card-board and tack *mm'*, and connects to the left-hand contact post D^4; then to a switch lever D^3; then to spring lever D; thence through the left-hand brass spring D'; thence through the left-hand carbons to the insulated cup O^2; thence through the wire shown in the "plan of diaphragm" and "inside of cover" as i^4; thence to the clamping screw n^2; thence by the wire i^3 to the upper hinge; thence by wires inside the box, to the two binding posts near the top of the left-hand side of box, and thence through the battery to the post I started from. That makes the primary circuit, which includes the primary of the left-hand induction coil and the left-hand carbons.

I will now describe the secondary circuit of the same coil.

Starting from the right-hand post on the top of box circuit, passes through a conducting wire to right-hand contact plate I^2, to right hand switch lever I', which is swung into contact with it; then to the left-hand switch I', which is swung over to the right, so as to make contact with the right-hand switch I'; thence through said left-hand switch I' to the left-hand coil, through its secondary; then to the left-hand switch I; then to the left-hand contact piece I^2; then, by the wire shown in drawing, to left-hand binding post on top of the box; then to the line, and back through the line to the left hand binding post on top of the instrument.

I believe I have described the connections correctly, as they were, but there might be other ways of arranging the switches.

Some of the wire connections are disconnected, so that they do not make the connections which I have described. For example, the two wires marked i^4, on the inside back of the box, sheet 1, proceed from the coil, but are not connected to anything at their other ends. The other ends were formerly connected to some of the switches. Both of these wires belong to the secondary coil. There is also a short piece of wire which now projects from the upper end of the left-hand induction coil of the instrument, nearest the back. This is not shown at all in the drawings. The draughtsman seems to have overlooked it. When in working order, it would come down and connect with the pivot of the switch J on the left-hand side of the bottom of the box.

Adjourned until December 16th, 1881, at 10, A. M.

December 16, 1881, 10 *o'clock*, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued.

[*Answer resumed.*]

In using this instrument, I sometimes put the primaries of both coils in circuit with one set of carbons—either the right-hand or left-hand set; that is, either one of them; that is my recollection. I did this by putting on an extra wire. You will notice on the two spring levers D, just below the screws d^2, two small octagonal plates attached to the spring levers D by screws, but not lettered in the drawings. These plates and screws are for clamping conducting wires—a sort of binding post, similar to the binding arrangement n', n^2. The extra wire

ELEPHONE COMPANY,-2

that I referred to ran from one of these clamps to the other, for the purpose above mentioned.

When I did this, my batteries were both in the primaries of both induction coils, one battery being in one primary, and the other in the other. I described, yesterday, that I used the primary of the right-hand induction coil and its battery with the right-hand set of carbons. I also described that I used the primary of the left-hand induction coil and its battery with the left-hand set of carbons. I would farther state that I used both of said arrangements together, or at the same time. In that case, both of the secondary currents went into the main line together, combining as one current, for the purpose of increasing the strength of the secondary current.

Q. 331. Did you use this instrument "J" for talking from one place to another? If so, to what extent?

A. Yes, sir; I used it for talking on different short lines in the shop. A number of people used it; I couldn't enumerate who they were. I used it pretty often while I was experimenting with it—trying it.

Q. 332. Did it work satisfactorily or not?

A. It did.

Q. 333. When you used the two primary currents through separate sets of carbons, and threw both their induced currents on the main line together, what was the result? Any improvement or not?

A. They were better when using both together.

Q. 334. State whether or not any changes have ever been made in this instrument since it was first constructed.

A. To the best of my recollection, there was no changes in it.

Q. 335. State whether you can fix the time when this instrument was first constructed, and if you cannot fix the exact time, give it as near as you can.

A. I cannot fix the exact time; it may have been between the year 1877 and 1878—thereabouts, as near as I can recollect.

Q. 336. It may have been most any time, but what is your recollection about the time?

A. As near as I can recollect, in them periods, or between them periods—1877 or 1878. I can't distinctly recollect the time.

Q. 337. Do you distinctly recollect making the instrument?

A. Yes, sir; I do.

Q. 338. Who made the case of the instrument?

A. I think it was George W. Drawbaugh.

Q. 339. Do you recollect whether the case or the machinery of the case was first made?

A. The machinery in the case was first made, I think. I am pretty confident of that, because I generally made the working parts before the cases were made.

[*Mr. Hill puts in evidence as "Exhibit P," the instrument which has been heretofore referred to as instrument "P" by the several witnesses*]

Q. 340. Please look at "Exhibit P," and state what it is and who made it.

A. That is a telephone transmitter and receiver, both combined. I made part, and part, I think, was made by George Drawbaugh. I was assisted by some one, I know, and think that it was George W. Drawbaugh.

Q. 341. What part did the assistant make?

A. The part made of wood—the wood casing, board, &c. I know I made the working parts, and part of the wood—those caps, including the mouth-pieces.

Q. 342. Which of the two machines was made first—this machine, marked "P," or the machine you have previously described, marked "J?"

A. I am positive that "J" was made before "P."

Q. 343. What is your best recollection as to how long "J" was made before "P?"

A. It may have been six or eight months; perhaps a year. I cannot recollect the length of time between those machines.

Q. 344. Has the machine "Exhibit P" ever been changed or modified since it was made or not?

A. It has not, to the best of my recollection.

Q. 345. Please describe the machine "Exhibit P" and its mode of operation in its completed condition.

A. A represents the base board. B a block for holding diaphragm, caps, &c. On the under side of said block B, was a horse-shoe-shaped groove for the reception of a permanent compound magnet I′.

On one of the poles of the permanent magnet I′, was secured an electro-magnet I, by a screw through the lower pole and into the heel of the core of the electro-magnet, as shown on "rear view of block B," sheet 3, of "Exhibit reproduced P drawing."

There is an opening through block B for the reception of the electro-magnet I. At the front side of block B, at the right-hand side, as shown in " Exhibit reproduced P drawing, sheet 2," there is a shallow recess for the reception of a metal diaphragm H.

Under the edge of the diaphragm is a circular groove for the reception of a rubber ring or gasket H'; said diaphragm is held in place by a wooden cap D, secured to block B by three screws.

In the center of cap D, there is a brass tube D' for the reception of a rubber tube D^2; said rubber tube has within it a spiral spring D^3, extending through its whole length, and terminating in the mouth-piece; said spiral springs extend out some distance from the end of the rubber tube, and its inner end slightly touches the center of the diaphragm H.

At the outer end of the rubber tube is attached a brass tube secured to a wooden mouth-piece, which mouth or rather ear-piece is not shown in the reproduced drawings, but appears in " Exhibit P drawing, first sheet." The ear-piece is composed as follows:

A bottom piece for the reception of a brass tube, and a recessed cap piece for the reception of a thin diaphragm. I used mica for this diaphragm, but have used a number of other substances.

The diaphragm is held in place between the cap piece and bottom piece of the ear-piece. The outer end of the spiral spring contained in the rubber tube D^2 lightly touches the mica diaphragm in the ear-piece just described.

At the left-hand side of the block B is another opening through said block, which is also recessed for the reception of the diaphragm of transmitter, which diaphragm is shown separately on sheet 3 of the drawings.

In the center of said diaphragm is secured to it a brass cup *e*, which is fitted with a carbon ball or block e'. Immediately back of said last-mentioned carbon block was another carbon block *f* suspended on a wooden pin f', passing through a hole in the upper end of the carbon.

Recess for dinner until 2 o'clock, P. M.

December 16, 1881, 2 *o'clock*, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

[*Witness continues.*]

There is a groove in the wooden block B, not referred to by letters in the drawings, for the reception of spring lever G′, at the upper end of which is secured thereto a brass cup G^2, for holding a carbon ball G^4.

The opposite end passes to a point opposite the screw K′. Said screw is for moving spring G′ with its carbon cup and ball closer to or further from the carbon suspended piece *f*. Some of these parts are not now in the original instrument; the screw K′ is.

K was a screw passing through the center of block B, or nearly so, for adjusting the electro-magnet closer to and further from the diaphragm H; L is a block of wood secured towards lower end of base-board A, which, on its back edge, has openings for the reception of induction coils L^2, which are placed in recesses L^1. One of these coils still remains in the original instrument. The openings extend through base-board A, and are marked J, on "P drawing, sheet 2"; they are four in number. In the center of cap-piece C is secured a brass tube C^2. At its outer end is secured a small funnel-shaped mouth-piece C′, for the purpose of transmitting sounds made in front of it.

Some of the conducting wires are off.

A wire passing through an opening in the base-board of upper left-hand corner, as shown in "Reproduced P drawing, sheet 1," goes through the base-board, and then passes down a groove on the back side of said base-board to the induction coil, on the right-hand side of "Rear elevation, sheet 2," of "Reproduced P drawing," and is connected to the secondary of said coil; thence through the secondaries of the series of coils; thence by a conducting wire, from said coil to an opening at upper right-hand corner of base-board, as shown in "Reproduced P drawing, sheet 1."

In the original instrument it shows the wire through a groove, and passing out at an opening opposite the right-hand end of block B, as shown in "Exhibit P drawing, first sheet."

A conducting wire passing through a hole or opening at lower left-hand corner of base-board, as shown in "P drawing, sheet 2," then up in a groove to primary of the induction coil, shown in "P drawing, sheet 2," then through the primaries of the other coils of the series, which were in the machine, but are not now, then to the diaphragm of transmitter by a wire marked g^2, on "Reproduced P drawing, sheet 3"; the circuit then passes through the carbons to spring G', then to a conducting wire G^3, then to a wire that leads out through the largest one of the holes marked l^5, on "Reproduced P drawing, sheet 2," which is also the largest of the holes marked L, in "P drawing, sheet 2," rear elevation, out to the front through a hole at the lower right-hand (left-hand corner of rear view) corner of the base-board A. This last-mentioned wire is shown on "P drawing, sheet 2," and is now on the instrument; that primary circuit continues outside and includes a battery, and then comes back to the starting-point.

One end of the coil of the receiver is connected to one of the secondary wires already described, and the other end to another of the secondary wires.

The grooves for these two wires are shown on "Rear view, P drawing, sheet 2." One of them is the long, straight diagonal groove, and the other is the short perpendicular one at upper left-hand corner of the figure.

Q. 346. Was this instrument "P" actually used for transmitting vocal speech? If so, how extensively?

A. It had been used similar to the other machines described; that is, I mean as extensively as the others, prior to this one. A number of persons spoke through it, and I spoke through it to a number of persons.

Q. 347. How satisfactorily did it operate?

A. As a transmitter, it acted very satisfactorily; as a receiver, not as good as some instruments that I had; but still you could hear and understand what was said. The instrument could also be used as a magneto instrument, speaking and receiving through the tube.

Adjourned until 10 o'clock, A. M., December 17, 1881.

December 17th, 1881, 10, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

[*Mr. Hill puts in evidence the machine heretofore referred to as instrument "N" to be marked "Exhibit N."*]

Q. 348. Please examine the instrument "Exhibit N" and state what it is, and who made it.

A. That is a telephone receiver and I made it.

Q. 349. State, as near as you can, the time when you made this instrument "N."

A. It is a little hard for me to state the time—just as in the others; working on so many, I have entirely lost the time of this one and others. I couldn't give the accurate time of any of them; not all, but some of them. "C" instrument I had circumstances to fix the time by; them that I had no circumstance to fix the time by I can't give the time of.

Q. 350. Please approximate the time of making instrument "N," as nearly as you can.

[*Objected to by Mr. Storrow.*]

A. I am perfectly satisfied that it was made before exhibit "P."

Q. 351. Was it actually used as a telephone receiver? If so, to what extent, and how satisfactorily did it operate?

A. I used it as a telephone receiver—that is, I spoke through it and others spoke through it. I thought it was a good receiver. I thought better than any others that I had previous to that.

Q. 352. Please describe the construction and mode of operation of "Exhibit N," as originally made and used, referring to "Exhibit N drawing," by way of illustration.

A. A represents the case or body of the instrument. C the lower cap of instrument; B upper cap; D coils of the electro-magnets. E two permanent magnets with their poles halved together, north to north and south to south. The poles are secured to the cores of electro-magnets by two iron machine screws. The lower side of the instrument is recessed to receive the permanent magnets. There are also two recesses through the instrument at or near the center, for the reception of electro-magnets D.

The permanent magnets carrying the electro-magnets are secured to the case of the instrument, in the recess at the lower side of the instrument, by two screws, shown on "rear elevation" at the top and bottom of figure. At the top of the case or body A of the instrument, was a shallow recess for the reception of a diaphragm. When the diaphragm rested in said recess, it came close to the poles of the electro-magnets, but not quite touching them.

At the upper side of the diaphragm were placed paper gaskets or rings, which supported or secured the diaphragm when the upper cap B was placed on the machine and pressed down.

On the under side of cap B, is secured to it a brass spring L, shown in the figure marked "inside of cap," also in "front elevation," having a circular brass block secured to the inner end by a small screw.

The original diaphragm was in one piece, and was, I think, of iron. I also used tinned iron. I used a number of materials.

There was also a screw, marked *l* in the drawing, for the purpose of adjusting or compressing inner end of spring L, closer or with more force against the diaphragm.

Q. 353. Did you afterwards modify, in any respect, the construction of this instrument? If so, how?

A. Yes, sir; the recess in the casing or body of instrument at the top was made deeper for the reception of a soft rubber ring or tube F′, which was placed around the outside of a plaster-of-Paris disc F, having an opening in its center, which opening admitted the top of the electro-magnets.

Upon said gasket or ring was placed the diaphragm, composed of two semi-circular halves, shown in the drawings as G G, made of steel and polarized.

Upon that was placed a wooden disc M, with a paper gasket or ring between it and the diaphragm. At its upper side it also had a paper gasket, the whole being kept by the upper cap piece B, which was secured by screws at its outer edge, to the upper part of the case; that is the modification.

I forgot to mention that there was an opening through the center of the wooden disc, as shown in the drawing at the lower right-hand corner. That is all the modification that I can think of.

Q. 354. How long was that modification made after the original instrument "N" was made, to the best of your recollection?

A. To the best of my recollection, it was not very long, though it might have been several months.

Q. 355. Was that modification made before this instrument "P" was made or not?

A. I could hardly say, but I think it was.

Q. 356. When you stated that the instrument gave good satisfaction and worked better in your judgment than any other receiver, did you mean that it worked better in its original form, or in its modified form, or in both forms?

A. I don't think there was much difference in its results. I think it worked about as well in one form as in another.

Q. 357. In the figure of "Exhibit N drawing," which represents a "front elevation, cap removed to show diaphragm," the divided steel diaphragm is represented with the plane of division intersecting both poles of electro-magnet. Was that the arrangement that you used, or if not, how was the line of division arranged?

A. When the machine was originally made, it was intended that the line of division would be through between the poles of the electro-magnets, at right angles to the way in which it is shown in the drawing. But when experimenting, I used it in different positions, without any material difference in the results.

Q. 358. Is this the only machine in which you ever used a polarized diaphragm?

A. It is the only one in which I used a permanently polarized diaphragm; but it is not the only one in which I used steel diaphragms.

Q. 359. Would or would not the steel diaphragms become polarized by use?

A. That would be somewhat of a question—to answer that. My opinion is that they would not. That is a question that electricians might not agree upon. I have tested them to see, but not very thoroughly; I just noticed that they did not become polarized.

Q. 360. On what instrument did you first use steel diaphragms, so far as you remember?

A. On either L or M; I don't remember which of the two.

[*Mr. Hill offers in evidence as* "*Exhibit Q*" *the instrument heretofore referred to by the witness as instrument* "*Q.*"]

Q. 361. What is this instrument, "Exhibit Q," and who made it?

A. That is a telephone receiver, and I made it.

Q. 362. Please give a brief description of it.

A. It was made in a similar manner to "Exhibit N," as the latter was when first made, with the exception of this one, "Q," having an iron diaphragm D, divided part way through its center as shown in the drawing; and that the ear-piece is made separate from the cup, but that was merely for convenience in turning, and is of no importance. The instrument never was used. There was a defect in the coils. I suppose the wire had been broken in winding it. There is another change in it, too:

In the bottom recess for the reception of the permanent magnet is turned a shallow groove for the reception of a diaphragm, which was kept in place by a paper gasket. The center of the diaphragm came close to the heel screws, which secured the permanent magnet to the coils, though the diaphragm did not quite touch said screws.

The intention of this instrument was to determine whether I could get better results by adding both of these vibrations in one, by adding the effect of the vibration from the rear diaphragm to that of the front. There was an opening around and between the electro-magnets, and I thought the vibrations might go through and add to the effect of the front diaphragm. I think yet it would make a good instrument.

The permanent magnet in this instrument is compound.

[*Mr. Hill offers in evidence as "Exhibit K" the instrument heretofore referred to as instrument "K."*].

Q. 363. Please state what this instrument, "Exhibit K," is and who made it.

A. It was intended for a telephone receiver, and has never been completely finished. I made it.

Q. 364. When was that made, to the best of your recollection?

A. I don't know. I have no distinct recollection.

Q. 365. Was it made before, or after "Exhibit P?"

A. It was made after. I might state—I have some circumstances. I think it was in the spring or summer of the same year that that interference suit between David Hauck and myself was being tried. Mr. M. W. Jacobs came to my shop. I think it was in that spring or fore part of the summer, and I showed him the instrument, and I had made it some time before, but do not remember the length of time.

[*By agreement of counsel, it is here certified that the testimony in the interference suit referred to, was taken in the summer of* 1879.

FRED. M. OTT,
Examiner.]

Q. 366. Was this instrument "K" practically used or not?

A. I had tried it, but did not get any good results, but heard spoken words through it. When using it, I found the jar or noise, produced by turning the friction roller, drowned out the results of the articulation or sound of the voice.

The friction roller was intended to be moved by clock-work—a continuous motion—but that portion was never applied.

Q. 367. Please describe the instrument and its mode of operation, referring to the drawings by way of illustration.

A. I will try to describe it. A represents a casing or body of the instrument; B, cap or mouth-piece; C, rear or bottom cap; F, two permanent magnets, bent as shown in "plan view" in the drawing; said magnets are halved together at their poles, that is, south pole to south pole, and north pole to north pole. At the poles of the permanent magnets are secured two coils on an electro-magnet G. The permanent magnets, with the electro magnet, are secured to the inside of the case or body A, of the instrument, by two wooden cleats F′, which are held in place by screws K. The poles of the electro-magnet extend in from the sides towards the center of the case A.

Immediately in front of the poles of the electro-magnet G, is placed an armature E, of iron; said armature E is held in place by two strips of metal, one *e*′, at bottom, attached to bottom diaphragm J, the other *e* attached to upper diaphragm D. That diaphragm is of brass.

On the side of the armature next to the friction roller, is secured a brass friction block, E′, for the purpose of being acted upon by friction roller H. Said roller is secured to a round wire rod or shaft passing through the case A. There are two brass binding posts, one at each side of case A, for the reception of conducting wires of coils of electro-magnet G.

The modified electric currents passing through the coils caused the armature to move to and from the poles of the electro-magnet, the movements, being in correspondence to the modifications of the current, cause different pressures of the brass plate E′ against the friction-wheel H, which would produce different amplitudes of vibration of the diaphragms.

The lower diaphragm was secured to a wire rod *e*′ by a screw-nut for adjusting the tension of the two diaphragms.

Q. 368. Did you ever make more than one instrument on the principle of the instrument K; that is to say, operating by friction, the amount of which was controlled by the armature?

A. No, sir. This one never was finished; it was finished all but applying the clock-work to turn the shaft of the friction roller.

Q. 369. Is the instrument "K" the latest one of all the original instruments which have been put in evidence here?

A. Yes, sir; it is.

Q. 370. Since you made that instrument "K," in the early half of 1879, or before that, have you made other telephone instruments which have not been the subject of testimony here in this case?

[*Objected to by Mr. Storrow.*]

A. Yes, sir; quite a number.

Q. 371. Where they good practical working instruments or not?

[*Objected to by Mr. Storrow.*]

A. Yes, sir; they were.

Q. 372. Are you still engaged in studying and experimenting to perfect and improve the electric-speaking telephone?

A. Yes, sir.

Q. 373. Have you made applications for letters-patent on your electric-speaking telephones?

[*Objected to as calling for secondary evidence and immaterial.*]

A. Yes, sir.

Recess until 2 o'clock, P. M. for dinner.

December 17, 1881, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 374. About what time did you make your first application for letters.patent on the telephone?

[*Same objection.*]

A. In July, 1880.

Q. 375. Can you give me the date of the death of your father?

A. It was about the 9th or 10th of December, 1878.

Q. 376. How old is your little boy Charles?

A. He is about eleven.

Q. 377. Is the telephone in any way associated in your memory with the time of his birth? If so, state the fact.

A. Yes, sir; some time after his birth—say a week or ten days—I took an instrument to the house that I was living at then. My wife was up-stairs in bed. I gave her one of the instruments and told her to listen, I would go down-stairs and I would speak to her. I did so, and she said afterwards that she heard the words that I spoke through it; I do not remember what the words were. The instrument that was used was, I think, the "C" instrument; I am pretty sure; I won't be too positive, but I think that was one of the instruments. I had a receiver with it, but I don't remember which one I had.

Q. 378. Did you have batteries connected with it?

A. Yes, sir.

Q. 379. Do you know what a string telephone or lovers' telegraph is?

A. Yes, sir; I do.

Q. 380. Did you ever make one?

A. No, sir.

Q. 381. Did you ever own one?

A. No, sir.

Q. 382. A great many witnesses in this case have testified that at different times, from 1869 down to within about a year last past, they have talked, or heard others talk, through instruments or machines at your shop, to which you gave the name of talking-machines. State whether or not those instruments, or any of them, through which said witnesses, or any of them, talked or listened, were string telephones.

A. No, sir; they were not.

Q. 383. State whether those said instruments, or any of them, through which said witnesses talked or listened, were or were not make-and-break telephones—by which I mean electric telephones in which the vibrations of the transmitting diaphragm make-and-break the electric circuit.

A. There were no make-and-break instruments.

Q. 384. I forget whether I have asked you the question, whether you ever invented or made a make-and-break telephone. Please state the fact whether you did or did not.

A. I did lately, within the last year or thereabouts; I never did before that.

Q. 385. You have stated that all the telephone instruments about which you have testified, from the original cup transmitter down to the friction receiver K, and including all the instruments which have been put in evidence, were made by you or under your direction. Please state who invented each and all of said instruments.

[*Objected to as incompetent.*]

A. I did.

Q. 386. Did you attend the Centennial Exhibition, at Philadelphia, in the year 1876?

A. Yes, sir; I did.

Q. 387. Can you give the date on which you went there?

A. I can by reference to a book. It was October 17, 1876. The 17th was a day on which I dated a letter from Philadelphia, while I was there on that visit.

Q. 388. How long did your visit there last?

A. About four or five days, to the best of my recollection.

Q. 389. Who went with you on that visit?

A. Mr. George Leonard.

Q. 390. Was that the only visit to the Centennial Exhibition that you made?

A. Yes, sir; it was.

Q. 391. At the time that you went there, or before that time, had you heard that somebody else besides yourself had invented a speaking-telephone—or a telephone?

A. Yes, sir; some time before that, I don't remember how long, but not a great while.

Q. 392. When you went there, did you suppose it would be on exhibition there?

A. I don't remember whether I had heard that it was on exhibition or not; but I got the impression some way that it was on exhibition.

Q. 393. While you were there at the Centennial, did you see any telephones, or make an effort to see any there?

A. Yes, sir; I made an effort and seen an instrument called a telephone, and supposed it to be the instrument spoken of—the one of which I had heard. I was looking and had made some inquiry, and was directed or came to a portion of the building where I saw on a counter some man's telephone, the name I don't remember. At that time, or several times that I called, there was no one there to attend to it. I spoke to another party that had something else on exhibition—I don't recollect what it was—just near by, and I asked him whether there was any one there to attend, or to show the instruments. I was informed then, there was no one there to show them.

Q. 394. If you remember, please state what kind of an instrument it was that you saw there, and state what information you were able to obtain there regarding it and its mode of operation.

A. There was a number of instruments placed on to a raised portion—something like a shelf. That is, it resembled something like pigeon-holes, a box open in front, and each instrument at the back of it had an electro-magnet. The number of instruments I don't remember. I don't remember of counting them. If I am not mistaken, there may have been a dozen or more, perhaps; some were larger than others. I could not give you a much better description than that. I couldn't get any information about them. This attendant made some remarks about the instruments, but he didn't understand them, and couldn't explain them. I was several feet from where the instruments were. They were placed—it occurs to me—on a raised place like a shelf, just about high enough for a man to speak into; that is the way it looked to me. I did not go in behind the counter to examine them, although there was an opening to go in by, because I did not like to make too free, as there was no one there.

Q. 395. Did you see any circulars lying around there referring to these instruments, or other advertisements of them?

A. I don't remember about that; it may have been.

Q. 396. What was your impression as to the character of the instruments, when you finally left them?

A. I was impressed with the idea that they were instruments to telegraph by sounds. A certain sound to represent a certain letter of the alphabet. I am not certain how I got the idea, or whether any person told me that at the time, but that is the idea that I had.

When I said certain sounds, I meant that sounds of a different pitch would represent different letters.

Q. 397. Do you know whether that was "Gray's Harmonic Telegraph" that you saw there or not?

A. It didn't say "telegraph;" I am confident it was called "telephone." I didn't see the working parts of the interior, except the electro-magnets. I took the name of the man and his address on a piece of paper, and put it in my pocket, but I don't know what became of it. I don't know whether it was "Gray's Harmonic Telegraph," or not.

Q. 398. Did you see any tuning forks about it?

A. I did not.

Adjourned until Monday, December 19, 1881, at 2, P. M.

LEPHONE COMPANY,-2

Monday, December 19, 1881.

Adjourned until Tuesday, December 20, 1881, at 10 o'clock, A. M., on account of the illness of Daniel Drawbaugh.

Tuesday, December 20, 1881, 10, A. M.

Examination resumed pursuant to adjournment, and adjourned until Wednesday, December 21, 1881, at 10, A. M., on account of the illness of Daniel Drawbaugh.

Wednesday, December 21, 1881, 10, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Storrow for complainants and Mr. Hill and Mr. Jacobs for respondents.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 399. Please look at the last six cuts printed in the complainants' printed record, of their application for interlocutory injunction in this cause, between pages 51 and 53, of said printed record, said several figures being entitled in said records as follows, to wit: "Complainants' Exhibit 1, Bell Telephone of 1875, (duplicate,)" "Complainants' Exhibit 2, Bell's single pole Centennial Membrane Telephone," "Complainants' Exhibit 2, Bell's single pole Centennial Membrane Telephone, (sectional view;)" "Complainants' Exhibit 3, Centennial iron box magnet receiver;" "Complainants' Exhibit 4, Bell's double pole Centennial Membrane Telephone." "Complainants' Exhibit 5, Bell's Centennial Liquid Transmitter," and state whether or not the instrument or instruments which you saw at the Philadelphia Centennial Exposition of 1876 were the instruments represented in these cuts, or any of them?

A. They were not.

Q. 400. Had you, or had you not, invented and made operative electric-speaking telephones prior to the time of the opening of said Centennial Exposition?

A. Yes, sir; I had.

Q. 401. Please indicate all the electric-speaking telephones that you had invented or made prior to the time when the Axle Company, composed of Bear, Grove, and others, commenced their operations at your shop—I mean, of all the instruments in evidence, and including the cup transmitter. Which ones of all these had you invented and made prior to the beginning of the Axle Company ?

A. The tea-cup instrument, the tumbler instrument, "Exhibit F," the tin-can instrument, "Exhibit B," instrument "Exhibit C," instrument "Exhibit I," and "Exhibit A," and the magnetos "Exhibit D," and "Exhibit E." Those are the instruments, as near as I can recollect; and I had modifications of these instruments. I won't positively say that "D" and "E" were prior to the Axle Company, but I know that at the time the Axle Company was running I had them there. It may have been prior to the starting of the Axle Company; it may be, but I don't want to be too positive. I refer to "Exhibit D" and "Exhibit E."

Q. 402. State whether or not the machines here in evidence, including those marked "F," "B," "C," "I," "A," "D," "E," and including also the old cup transmitter, of which you have put a sketch in evidence, and including also the modifications, to which you have referred in your testimony, include all the electric-speaking telephone instruments which you made, from the time of the original cup transmitter to the time of the little magneto telephones "D" and "E."

A. No, sir; not all. At the time I was experimenting, I would often make experimental parts—cases, you know, with coils and magnets, and afterwards would make more complete machines—complete cases; that occurred a number of times.

Q. 403. What became of these crude or temporary structures that you so made preparatory to making the more complete forms ?

A. I could hardly state what became of them; they would lie about the shop for some time, and then become destroyed in some way, I don't know what.

Q. 404. Mr. Christian Eberly, a witness on behalf of defendants, has testified, on pages 119 and 120 [114 and 115] of defendants' printed record, that he saw instrument "A" prior to December 22, 1870. How does your recollection, as to the time of making instrument "A," compare with Mr. Eberly's?

A. I didn't think it was as early as that; I may have been mistaken, but my recollection does not run back quite as far.

Q. 405. State whether you have or have not any recollection of that instrument "A" prior to the time when the Haucks bought the faucet business in July, 1873.

A. I can't connect it with that circumstance, to the best of my recollection. I can with the Axle Company. It was prior to the Axle Company, I know.

Q. 406. A good many of the witnesses who have been examined for the defendants have testified that you were, at various times, talking of patenting your electric-speaking telephone invention. What is your recollection about that? Did you intend to patent it or not?

A. Yes, sir; I intended to patent it. I had spoken to a number of persons to assist me. I would state to them that I would give them an interest in the invention, for them to furnish the money to have it patented.

Q. 407. Why did you not patent it with your own money?

A. I didn't have any money.

Q. 408. At how early a time did you have the intention of patenting this invention?

A. I could hardly say how early. I know it was at an early time; I know I spoke to persons even at an early time. I spoke to Mr. Christian Eberly; it may have been prior to 1870. I spoke to Frank Lee; he has been dead a number of years, I don't know how long. I spoke to them about taking an interest in this apparatus, then termed a talking-machine.

Q. 409. Were they among the earliest ones whom you talked to about taking an interest in it?

A. I couldn't say whether they were the earliest; I can say they were among the earliest. I can't remember all the persons I had spoken to about it, as I had spoken to a great many.

Q. 410. Who was Frank Lee, and where did he live?

A. He lived at New Cumberland. He was a man engaged in the lumber business quite a number of years. He and Christian Eberly were in partnership in the lumber business, as Lee & Eberly, I think, at New Cumberland. Afterwards his brother was in partnership with Mr. Eberly, and, I think, under the same firm name, but I won't be too positive about that.

Q. 411. When did you consider the invention sufficiently complete that you were desirous of patenting it, in the form in which you then had it embodied?

A. I could hardly remember the year or give any particular date, but at an early date. At the time I showed it to those parties, I was desirous of having it patented, but some of those parties tried it and seemed to think it was not sufficiently complete; that it ought to be so that it could be placed on a table, and would talk out; that seemed to be the idea. I would then say to them that it could be greatly improved; that I was not yet through with my experiments; that is, that I could make it a great deal louder than it was.

Q. 412. At the time that they tried it and seemed to think that it was not sufficiently complete, or, in other words, loud, were you able, by putting your ear to the receiver, to hear and understand what was spoken into the transmitter at the other end of the line or not?

A. Yes, sir; I could hear, and others heard also, what was spoken through it.

Q. 413. Was it their idea that the instrument should speak loud enough for a person to stand away from the receiver and hear what was said?

[*Objected to by Mr. Storrow as leading, as calling for hearsay, and as calling for ideas of other persons.*]

A. That was the impression I got; that was the idea they had; that it should speak loud enough that they could hear at a considerable distance from the receiver the words spoken.

[*Same objection.*]

Q. 414. From the time when you first invented the old cup transmitter down to the present time, state whether you ever have or have not, at any time, laid aside and abandoned your telephone invention, with no intention of ever resuming it. What is the fact about that?

[*Objected to as incompetent.*]

A. I have never abandoned it, from the earliest time of working at it. I have left it lay for a time, that I was compelled to work on other work, but never abandoned it.

Q. 415. For how long a time did you ever let it lie, at any one time, without doing anything at it, in the way of study, experiment, or the making or testing of instruments?

A. I could hardly say how long I left it lie at one time. It might have been, maybe, six months sometimes that I would not do any work on the machine, but I don't suppose there was a week but what I was engaged in the way of studying on it.

Q. 416. Why were you compelled to let it lie at times and devote your attention to other work?

A. I was compelled for the reason that I was poor. I had a large family to maintain.

ELEPHONE COMPANY,-2

Q. 417. Was the maintenance of your family dependent upon your daily labor or not?

A. Yes, sir; it was.

Q. 418. Did your wife and near relatives endeavor to encourage or discourage you in your work on the telephone?

[*Objected to as incompetent and hearsay.*]

A. My wife and my brothers discouraged me all the time.

Q. 419. Which of your brothers was most opposed to your working on this invention?

A. John B. Drawbaugh.

Q. 420. Did he make a good deal of opposition to it or not?

A. He did, a good bit. He would often speak to me about it; and to avoid that I would often hide the instruments when he would come to the shop.

[*Objected to as hearsay.*]

Q. 421. Were you subjected to any ridicule, in the community where you lived, by reason of your telephone invention, and your work upon it or not?

A. Yes, sir; a good many persons there used to laugh at the idea of working upon a machine of that kind—I mean in the village that I lived at.

Q. 422. Prior to the introduction of speaking-telephones into public use in this country, did you ever learn of your sanity being questioned, by reason of your work upon your talking-machine?

A. That has been said by a number of persons, but not in my presence—not that I can remember of. Other persons would tell me that they said that they thought by my working on it that I was crazy—that it was talked of in the store.

[*Answer objected to as hearsay.*]

Q. 423. At how early a time did you hear of such remarks being made?

A. At an early time; about the beginning of my work and along for several years, I guess—my work on these instruments, I mean.

Q. 424. State whether your work in inventing the electric speaking-telephone, and in subsequently improving the instruments, from the time of the original cup transmitter down to the year 1879, did or did not consume a great deal of time that would otherwise have been devoted to your daily labor for the support of your family?

[*Objected to by Mr. Storrow as leading.*]

A. It did.

Q. 425. Did your devotion to this telephone work, during that period, render it necessary to keep your family more closely—that is, more economically—than would otherwise have been the case, or not?

[*Same objection.*]

A. Yes, sir; it was necessary for me to economize. I was contracting debts, which were demanded of me, and I was compelled to stop working on these machines, to try and get clear of debt. I know that went very reluctantly with me, as I was anxious to work on these machines.

Q. 426. Did that occur more than once, or only once, that you were compelled to stop working on these machines, and pay debts that were demanded of you?

A. Yes, sir; often.

Recess for dinner until 2, P. M.

December 21, 1881.

Examination resumed pursuant to adjournment.

Present, same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 427. What was your financial condition for several years last prior to the purchase of your faucet and pump inventions by the "Drawbaugh Pump Company," or "Drawbaugh Manufacturing Company"—I mean the company of which Mr. William R. Gorgas was a member—in May, 1867?

A. My finances were very low; I know that.

Q. 428. Were you considerably in debt during that time or not?

A. Yes, sir.

Q. 429. Your first sale to said Company was of your pump invention, if I understand the matter correctly. Am I right?

A. Yes, sir.

Q. 430. Prior to that, you had sold the faucet invention, or a part of it, to A. H. Gardner, known generally as Harry Gardner, had you?

A. Yes, sir ; an undivided half.

Q. 431. What did Mr. Gardner undertake to pay you for that undivided half of the faucet invention, which you sold him ?

A. One thousand dollars.

Q. 432. Was it the same invention in which you sold an interest to Gardner for faucet purposes, that was sold to the Pump Company for pumping purposes, or were there two inventions, one a faucet and the other a pump ?

A. It was the same invention, or held under the same patent. The one I sold to Gardner was for pumping viscid liquids, and the one sold to the Pump Company was for pumping aqueous liquids. That is about the way we style it.

Q. 433. Did Gardner pay that thousand dollars in cash at the time that he bought the interest in the faucet ?

A. He did not ; he gave me a note for the amount, with Dr. Lewis Heck, an iron-master of Dauphin county, as surety.

Q. 434. What became of that note on which Dr. Heck was surety ?

A. I held it for a number of years, and demanded the money from Gardner. He told me that he couldn't pay it and he didn't want the note to be pushed. He said if I would give him the note he would get Coover, his brother-in-law, a man of means, on the note as surety. I gave him the note and he gave me another one in its place, with his brother-in-law on as surety, and told me he would pay the note at a time I would need it ; I needed it all that time. This occurred about harvest ; I don't remember the year, but the circumstances I remember.

The following spring I told him I needed the money, and the arrangements were that he was to pay me that spring. In the spring, he got a party whose name was Nell—the first name I don't remember. He was to furnish the money. He said he would get Mr. Gorgas to go as surety for the money, which he was to get from Mr. Nell.

Mr. Gorgas refused to go in. Mr. Nell agreed that if Mr. George B. Heck, my brother John B. Drawbaugh, and myself, were to sign it as sureties, he would give the money. Mr. George B. Heck was to hold the original note as collateral security.

These parties mentioned, including myself, met at Mr. Gardner's house one evening, and the papers were closed ; that is, the note was signed, and Mr. George B. Heck neglected to take the old note as collateral.

In the morning, one of us called at Mr. Gardner's ; I think I called.

He said he was sorry he could not give the note; he had burned the note; that was the remark he made. I mean the old note that Mr. George B. Heck was to receive as collateral.

Q. 435. Had Mr. Nell let Mr. Gardner have the money on the new note the evening before?

A. Yes, sir.

Q. 436. And had Mr. Gardner paid the thousand dollars over to you the evening before?

A. I think so; I think he paid it that evening.

Q. 437. So that you had got the thousand dollars on Gardner's note to Nell by becoming surety with others on said last-mentioned note. Is that the fact?

A. Yes, sir; that is the fact.

[*Mr. Hill here offers in evidence a certified copy of certain docket entries, from the records and proceedings enrolled in the Court of Common Pleas, in and for the county of Cumberland and Commonwealth of Pennsylvania, said certified copy to be marked "Exhibit Drawbaugh judgments."*

Objected to by Mr. Storrow as an exhibit, and each and every part thereof, for the reason that the same does not appear to be a true copy of the records in the several cases referred to; and for the reason that it appears by the certificate, forming part of the exhibit, that said exhibit does not contain true copies of the whole of the records in said cases.]

Q. 438. In said exhibit, it appears that at the April term of said court, A. D. 1872, John B. Nell obtained a judgment against A. H. Gardner, Daniel Drawbaugh, George B. Heck, and J. B. Drawbaugh, upon a note stamped and dated April 1st, 1869, payable twelve months after date, with interest, etc. Please state whether or not the note therein referred to was the note which you signed as surety for the purpose of getting the one thousand dollars from Gardner, as you have testified?

A. Yes, sir; that was the note.

Q. 439. What did you do with the one thousand dollars which you got from Mr. Gardner, or from Mr. Nell, on the Gardner note, as you have testified?

A. I gave that to my father; he had purchased a farm.

Q. 440. Were your father and mother both living at that time, April 1, 1869?

A. Yes, sir; they were both living at that time.

Q. 441. How old were they at that time?

A. My mother was about seventy-five and my father about eighty-two; my father was about ninety-one when he died in 1878.

Q. 442. At that time, in April, 1869, was your mother of sound mind or not?

A. No, sir; she was not.

Q. 443. Did she continue of unsound mind till her death?

A. Yes, sir; and required a great deal of attention; there had to be some one all the time attending to her.

Q. 444. Had her mental condition anything to do with causing the old people to be moved out into the country on to a farm? If so, what?

A. Yes, sir; they had been living in Newville, and notwithstanding all their attention, she would get away sometimes, and get on to the railroad; and my brother Harry came to consult me, to see what was to be done.

He told me there was a farm for sale, that was considered a cheap farm; that my father had some money, but not enough to buy a farm, and that if I would give some money towards it, he would; that it was not safe to have our parents in town there.

My father would buy the farm and move on it, and he thought by that means we could keep them more economically, and that they would feel more satisfied away from town.

This conversation was before I had got the money from Nell, or before the arrangement between Nell and Gardner.

At that conversation I told him I would see; that Mr. Gardner owed me, and I would try to make arrangements to get that money.

At the same conversation we both agreed to let my father have the money, and to charge no interest for it.

Q. 445. Your father at that time was a very old man; was he able to do much in the way of helping to support himself, or not?

A. No, sir; I don't think he did any labor at all.

Q. 446. Did you ever afterwards get back any of that one thousand dollars that you put into that farm or not?

A. I think I got a little, but not much; the amount was very little. In some settlement and arrangement that my brother and I had, I received some, but the amount was very little.

I might find out, but I don't think it was a hundred dollars—some little settlement that my brother and I had about a distillery.

AMERICAN BELL TELEP

Q. 459. When and how did Samuel M. Hertzler pay his one thousand dollars?

A. As near as I can remember now, he paid me the biggest proportion in cash and the balance within a few months; it was all closed up within six months, as near as I can recollect.

Q. 460. Out of that money which you received from Mr. Hertzler at that time, was any portion of it lost? If so, how?

A. Yes, sir; there was a portion. There was a gentleman living at my place there—at Eberly's Mills—spoke to me about purchasing some apples at Williamsport—said there was a large speculation in apples. He said if I would furnish him four hundred dollars, he would give me a large percentage. He said he would give me the half of the profits, which he had figured up to a large amount. I got that amount—four hundred dollars—from Mr. Hertzler, and gave it to Mr. George Miller, the man referred to. He went to Williamsport, and arrived there in the night. When getting off the train, he was caught in some way by the train—or it was supposed so—and was killed. He was found in the morning dead; the money was found on his body. He had a memorandum of four hundred dollars from me. The expenses occurring there, coroner and jury expenses, were paid out of that money. The coffin was also paid out of it. I paid a man by the day for going up for the body, and also paid all his expenses. I never kept any account of the money paid out, but, to the best my recollection, it was a hundred dollars or more. The balance I got back, but I don't remember the amount.

Q. 461. Please look at the promissory note which I now show you, and state whose signature is attached to that note.

A. John Sheely's signature is attached to that note; the same John Sheely above referred to.

[*By consent, the following copy of the note and its indorsements is put in evidence, the original to be produced when called for*:

"*May* 24*th*, 1867.

2 cts.

"March 31st, 1868, received on the within note two hundred dollars.
DANL. DRAWBAUGH."

The note also bears the endorsement "J. Sheely," across the back a little below the middle.

FRED. M. OTT,
Examiner.

Q. 462. For what was that note given by Mr. Sheely?

A. For the balance due on his one-sixth interest in the "Pump Company," in addition to two hundred dollars which he paid in cash at the time.

Q. 463. This note, dated May 24, 1867, has indorsed upon it the following payments: Dec. 24, 1869, $200.00; February 1, 1868, $400.00; March 31, 1868, $200.00; were those payments made at the times referred to?

A. Yes, sir; I suppose so. My recollection is guided by the note.

Q. 464. Were those indorsements made at the time, as the money was paid?

A. Yes, sir; that is my recollection.

Q. 465. The note shows no payment of any interest. Is it the fact that Mr. Sheely paid no interest on the note?

A. Yes, sir; that is the fact; the interest was demanded, but he refused to pay it. He stated that he had lost enough in the Company, and thought I should give him clear.

Q. 466. Did you put the note in the hands of a collector or not?

A. Yes, sir; I did. I gave it to A. B. Shank for collection. He did not make the money. Mr. Shank returned the note and told me what I have stated before. I also saw Mr. Sheely myself. I don't remember whether it was after or before Mr. Shank returned the note. I think it was after Mr. Shank returned the note, but I won't be positive.

Q. 467. Please look at another promissory note which I now show you, and state whose signature is attached to it?

A. The signature of Henry S. Rupp, above referred to.

[*By consent, the following copy of the last-mentioned note, and its indorsements is put in evidence, the original to be produced when called for.*]

"*May* 24, 1867.

$800. HENRY S. RUPP."

The indorsements on the back are as follows:

U. S.
Internal Revenue
STAMP.
2 cents.

Rec. Jan. 14, 1868,
Two hundred dollars
on within note.
DAN'L. DRAWBAUGH.

Re'd April 16, 1868, Four hundred dollars on the within note.

DAN'L. DRAWBAUGH.

Rec'd April 16, 1868, twenty-two dollars, being the interest in full on within note until May 1, 1868.

DAN'L. DRAWBAUGH

Received March 30th, 1869, Two hundred dollars on the within note.

DAN'L. DRAWBAUGH."]

Q. 468. By the indorsements on this last-mentioned note, it appears that the following payments were made thereon, to wit: January 14, 1868, $200; April 16, 1868, $400; April 16, 1868, $22 interest;

ELEPHONE COMPANY,-2

March 30, 1869, $200. Were those indorsements made at the times when they are respectively dated, and do they state correctly the several payments on the note?

A. Yes, sir; I believe so.

Q. 469. Was that note given for the balance of Mr. Rupp's purchase-money of one thousand dollars above referred to?

A. Yes, sir.

Q. 470. Then he paid two hundred dollars before or on the date of the note, did he?

A. Yes, sir; on the date of the note, to the best of my recollection.

Q. 471. The indorsements on the note indicate that all the interest was never paid on it. Is that the fact or not?

A. Yes, sir; that is the fact. I had given that note to Mr. Shank for collection, and Mr. Rupp declined paying.

Q. 472. Did Mr. Hertzler pay a portion of his in cash and the balance in notes?

A. I think he did. I think he paid two hundred dollars in cash and the balance in notes; but I won't be too positive about the notes. He paid me the whole amount within a few months. I have not found any of Hertzler's notes among my papers.

Q. 473. In your answer to a former question, you conveyed the impression that Hertzler paid the largest amount of his thousand dollars in cash. Upon reflection, what is your memory about it, whether it was two hundred dollars cash down or more?

A. I wasn't positive to any particular amount, and I am not now; but I am positive that he paid me the full amount within some months —two, three, four, or perhaps six months.

Q. 474. How did Mr. Hursh, at the time of the purchase, make his payments? Did he give notes for the entire amount or did he pay any portion of it in cash?

A. To the best of my recollection, he gave me two notes—a two-hundred-dollar note and an eight-hundred-dollar note.

Q. 475. Did he afterwards pay those notes? If so, how?

A. Yes, sir; he got money out of the Mechanicsburg First National Bank. He threw a note in there and I indorsed it; that is to the best of my recollection.

Q. 476. Did he pay that note to the Bank at its first maturity or was it renewed from time to time?

A. He didn't pay it. It was renewed a number of times; I couldn't say how often; I mean he didn't pay it at maturity.

Q. 477. When the note was originally put into Bank and discounted, you received the proceeds, I suppose. Is that the fact?

A. Yes, sir.

Q. 478. Do you remember what you did with the thousand dollars that you got on the discounted Hursh note?

A. Yes, sir; I paid that on a property that I bought from one Elisha T. Hauck.

Q. 479. What property was that that you bought from Hauck?

A. A dwelling-house and blacksmith-shop in Milltown, that I afterwards sold to Daniel Fettrow.

Q. 480. When did you buy that real estate?

A. I think I contracted in the fall of 1867, and got possession in the spring of 1868.

Q. 481. Did you get the proceeds of that discount and pay it over on the real estate before you got possession of the real estate, or not?

A. About the time I got possession, as near as I remember; I don't remember the number of days before.

Q. 482. What was the amount of the purchase-money which you were to pay for that real estate?

A. Twenty-three hundred and ten dollars.

Q. 483. When did you get your deed of that real estate—before, or after, or about the time that you got possession of the estate?

A. About the time I got possession. The rule is there that on the first of April deeds are delivered, or about the first—within a few days.

Q. 484. How much money did you pay on that real estate before or at the time when you got the deed?

A. The full amount, with the exception of a judgment of about three hundred dollars, as near as I can recollect now.

Q. 485. Against whom was that judgment rendered originally?

A. Against Elisha T. Hauck, in favor of Neidhamer; I forget his first name.

Q. 486. You bought the property, then, subject to that judgment, did you, and assumed the payment of that judgment yourself?

A. Yes, sir.

Q. 487. At the time when you sold the interest in the pump patent to Mr. Gorgas and others, as you have testified, did you owe any debts growing out of old transactions prior to that time or not?

A. Yes, sir.

Q. 488. Did you use any of the purchase-money paid you by Hertzler, Gorgas, Rupp, Hursh, or Sheely, in payment of those old debts? If so, to what amount, to the best of your recollection and knowledge?

A. Yes, sir; I did use money out of them payments; the amount I am not prepared to say, but to the amount of a thousand dollars or more, I am positive.

Q. 489. You have testified that you paid the one thousand dollars of the Hursh discount in part payment of your house and lot. Where did the remaining one thousand and ten dollars come from which you paid on that house and lot?

A. From payments on the notes above referred to, given by the parties in the Pump Company; that is the way I think it was. I don't know where else I would have got the money. That is my recollection of the fact.

Q. 490. When you made the sale of the interest in the pump patent to those parties, had you been, for several years before that time, doing a good business and making money, or what was the fact?

A. A number of years before that I was in business in manufacturing a stave-cutting machine. My principal trade in that was in the South. I thought at the time I was doing pretty well. I had a party selling for me in the South as an agent—selling a good many machines and territory; that was shortly before the breaking out of the Rebellion. Parties there had bought machines and owed me considerable money, some four or five thousand dollars.

This agent that was selling there collected a part of that money and kept it. That is, he stayed in the South and went into the Rebel army, and I have never heard of him since.

By that contract, I was entirely broken up, and had nothing; though I had a good many debts, I am sure of that. I never received a cent of that money after the starting of the Rebellion.

Q. 491. From the close of the war of the Rebellion, down to the time when you sold the interest in the pump patent to Gorgas and others, were you doing a good business and making money or not?

A. No, sir; I was not doing a good business.

Q. 492. When you received the money from Gorgas and others, as you have testified, what was the condition of your family and household supplies? Was it such that you had to apply a portion of the money immediately to that purpose or not?

A. Yes, sir; I was poor. I was in need of a good many necessary articles. I could not state the amount, but we used a considerable amount of that money for necessaries for the family.

Q. 493. You have heretofore testified that you used the money that you received from A. H. Gardner in purchasing a homestead for your parents. Did you use, for the benefit of your parents, any of the money which you received from Gorgas and others on their purchase of the pump patent. If so, to what amount, to the best of your recollection and belief?

A. I did; but the exact amount I could not state; to the best of my recollection, it was several hundred dollars. I don't suppose it was less than four hundred dollars.

Q. 494. What did you buy for your parents with that money, or how did you use it for them?

A. I bought, at different times, clothing; I bought a full set of furniture, the time when they went to housekeeping on the farm. I bought bedding, &c., and a great many different articles that I can't enumerate. I also gave my father money at different times, in addition to the Gardner money.

Q. 495. Did they go to housekeeping at about the time the farm was purchased?

A. Yes, sir; I think that same spring. I mean the same spring that possession was given of the farm; I think so.

Q. 496. That was the spring of 1869, was it not?

A. Yes, sir. I am guided by the papers; I don't remember the year. The bond for the purchase money was dated April 1, 1869.

Recess until 2 o'clock, P. M., for dinner.

December 22, 1881, 2, P. M.

Examination resumed pursuant to adjournment.

Present, Mr. Storrow for complainants and Mr. Hill and Mr. Jacobs for respondents.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 497. While you were a member of the Pump or Faucet Company, in which Gorgas and others were interested, as you have testified, you had certain assessments to pay in as a stockholder, did you not?

A. Yes, sir.

Q. 498. The testimony of Mr. William L. Gorgas, printed in defendants' records, pages 678, 679, [649, 650,] etc., shows that you paid in, as instalments and assessments into that Company, in actual cash, the sum of twelve hundred and ten dollars, as follows, to wit: June 27, 1867, $250; July 6, 1867, $50; July 22, 1867, $100; November 11, 1867, $200; January 20, 1868, $350; May 5, 1868, $250; June 10, 1868, $10. Where did you get the money to pay these several instalments, amounting to $1,210?

A. The time that has elapsed since is a good while. I don't remember where I got the money to pay the different instalments. One of the instalments, I remember, I borrowed money to pay. I won't say one, it might have been one or two, I borrowed money to pay instalments. It occurs to me that the instalments were more than what you read there. If my memory serves me, I borrowed five hundred dollars from one David Ditlow; or between four and five hundred dollars.

I went to see Mr. Ditlow a few weeks ago, to find out the amount, as I had forgotten it. He thought it was about three hundred dollars. I know I paid it back to him in partial payments, and sometimes I gave him new notes for the balances. I paid him the last balance of about sixty dollars, about a year ago, in the latter part of the summer or fall.

Q. 499. What is the best of your recollection and belief as to where you got the rest of the money from, that you paid to the Company in assessments and installments, up to June 10, 1868?

A. To the best of my recollection and belief, I got it from the parties who had purchased interests and given me their notes. It was part of the purchase-money which they paid me for their interests.

Q 500. What financial resources had you at that time, if any, except the money which those gentlemen paid you for their interests, and except your daily wages?

A. No other.

Q. 501. Mr. William L. Gorgas testifies, on pages 679 and 680, [650 and 651,] of Defendants' printed record, that from the time of the organization of the said Company down to July 19, 1873, labor done by you for the Company to the amount, $976.33, was not paid for in cash by the Company, but the amount was credited to you upon instalments and assessments due from you to the Company, in addition to the said $1,210. Does that accord with your recollection or not?

A. There was wages held back for instalments, but the amount I do not remember.

Q. 502. Out of that amount, $945, seems to have been earned prior to March 1, 1871, which would show that the Company held back an amount somewhere in the neighborhood of $300 per year from your wages. How does that amount compare with the total amount per year that your wages would come to?

A. I don't understand the question.

Q. 503. I will get at it in another way. Do you remember, or can you tell, about how much your wages came to per year, while you worked for that Company in 1868, 1869, and 1870, down to March 1st, 1871?

A. I cannot; I could if I had not lost the book that I kept those accounts in; I don't remember the amounts.

Q. 504. Were you hired by the day, the month, or the year?

A. By the day.

Q. 505. What were you to have per day as wages?

A. To the best of my recollection, it was $2.00 per day I was to have.

Q. 506. Do you recollect whether you worked continuously for them or not, and, if not, have you any idea of how much time you lost?

A. I did not work continuously for them, but I don't remember exactly and could not state—but there was times that I worked on other improvements, and there was times when the Company stopped work, that they gave me permission to do work for myself in the shop while the Company was not operating.

Q. 507. Do you recollect whether you did much work for them after March 1, 1871, the date when the last labor was credited up to you or not?

A. I don't think I did; I don't remember, though, clearly.

Q. 508. After you ceased working regularly for the Company, and during the years 1871, 1872, and down to July, 1873, when the Haucks purchased the business, did you have any regular and steady employment, on wages or salary, or any regular and steady income, or not?

A. No, sir; I had none. I had no regular and steady employment and no income, except from what odd jobs I would do in that shop for myself.

Q. 509. Why did you borrow money from Mr. Ditlow to pay the instalment that you referred to?

A. I was compelled to pay the instalments, or else I would have lost my interest in the Company.

Q. 510. Do you remember whether you used all the money that you borrowed from Ditlow for paying one instalment, or whether you used any portion of the borrowed money for any other purpose?

A. I don't recollect distinctly how much of the money borrowed I used for paying instalments. I may have used some of the borrowed money for the maintenance of my family.

Q. 511. Do you remember whether, about the time that you borrowed that money, you were hard-pressed to provide for the support of your family or not?

A. Yes, sir; I was. I know that.

Q. 512. Was that money borrowed at about the time when one of those instalments was paid to the Company, as shown by the books?

[*Objected to by Mr. Storrow as leading.*]

A. I think it was. I have a circumstance that I remember of. Mr. Gorgas came to me and told me that there was an instalment due that I should pay. I told him I didn't have the money, and he wondered if I hadn't better borrow it. I told him I didn't know where to borrow. He said he thought he could make arrangements that I could get it from Ditlow; that he would see Mr. Ditlow, and he did; and afterwards he told me he had seen Mr. Ditlow, and Mr. Ditlow said he would let me have the money. The money was paid immediately to the Company, but I don't remember that I paid in all the money that I got from Ditlow. I don't remember the exact amount.

Q. 513. The last instalment, exceeding ten dollars, which you paid into the Company in cash, was on May 5, 1868, when you paid in $250. I have in my hand a note dated April 4, 1870, for $200, with interest. Was said note made at the time when you borrowed the money, or was it one of the extensions or renewals that you referred to in your testimony a little while ago?

[*Objected to by Mr. Storrow as leading.*]

[*Question withdrawn by Mr. Hill.*]

Q. 514. Please look at another promissory note which I now hand you, and state whose signature was attached to that note, and whether the note was made at the time of its date, April 4, 1870.

A. It was my signature attached to the note; the place for the signature has been torn off. The note was made April 4, 1870. I don't remember the date, but I go by the face of the note.

Q. 515. Was that note an original note or a renewal?

A. I think it was a renewal. My impression is that the original note was for between four and five hundred dollars.

Q. 516. Why did you renew the note at that time? Didn't you have money enough to pay it?

[*Objected to as leading.*]

[*Question withdrawn by Mr. Hill.*]

Q. 517. Why did you renew the note at that time? Did you have money enough to pay it?

[*Objected to as leading.*]

A. I renewed it because I didn't have the money to pay it.

[*By consent, a copy of the note and its indorsements is put in evidence, the original to be produced when called for, as follows:*]

"$200.00. Eberly's Mills, Penn'a., Apr. 4, 1870. One year after date we, or either of us, promise to pay to David Ditlow, or order, two hundred dollars without defalcation for value received with interest from date."

[U. S. Int. Rev. Stamp. 10 cts.] [Signature torn out.]

"March 27, 1871, received twelve dollars on within note.

DAVID DITLOW."

"April 1st, 1872, received on within $12.00 for interest."

"April 1st, 1873, received on within $12.00 for interest."

Q. 518. Did that note grow out of the transaction of your borrowing money from Ditlow to pay the instalments, as you have testified?

A. Yes, sir.

Q. 519. Please look at another promissory note which I hand you, dated April 9, 1874, and state whose signature was attached to that note, and when and for what it was given.

A. It was my signature; a portion of the letter D still remains; the rest has been torn off. The body of the note is in my handwriting. It was given April 9, 1874; it was given for a balance that remained unpaid on the other note, last referred to.

Q. 520. When was this last note of April 9, 1874, finally paid?

A. About a year ago, or a little more.

[*By consent, a copy of the note and its indorsements is put in evidence, the original to be produced when called for, as follows:*]

"$50.00. *April 9th*, 1874.

Six months after date I promise to pay unto David Ditlow fifty dollars, without defalcation for value received.

D "

[*This part of note torn off.*]

The indorsements on the back of said note are as follows:

"*April* 1, 1876.

Received upon the within note $2.00."

"*April 2nd*, 1877.

Received on the within note, intres. $4.00."

Q. 521. At the time when you purchased the dwelling-house, lot, and smithy, at Milltown, as you have testified, what was the condition of the house as to repair?

A. It required considerable repair. I weather-boarded the whole outside of the building, put up a new porch, and other repairs that I don't remember now. I put a new roof on part of the house. I painted the house on the outside and repainted some of the rooms.

Q. 522. How much did those repairs, at that time, come to, to the best of your recollection and belief?

A. I could hardly state. I suppose between three and four hundred dollars. I may be able to find out what the amount is from the bills, if they are not lost. I think there are bills, that I may find.

Q. 523. Was that the first dwelling-house that you ever owned?

A. Yes, sir; it was.

Adjourned until December 23, 1881, at ten, A. M.

December 23, 1881, ten, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 524. For several years prior to the purchase of the faucet business by the Haucks, in July, 1873, had you been able to earn money enough to pay your necessary living expenses and keep from getting in debt or not? State the facts upon that subject.

A. No, sir; I was not able to keep out of debt. I know I was very hard up during all that time.

Q. 525. It appears from the testimony of William L. Gorgas, on behalf of Defendants, as printed on page 683 [654] of Defendants' printed record, that on July 19, 1873, the sum of four hundred and twenty-five dollars was paid to you by the Faucet or Pump Company, out of the proceeds of the sale to the Haucks; is that in accordance with your recollection or not?

A. I remember of them paying me money, but I have forgotten the amount; but I believe that to be correct.

Q. 526. You have testified that you bought the Milltown homestead, subject to a judgment of $300, in favor of one Neidhamer. Do you remember whether that Neidhamer judgment was paid before you got your share of the Hauck money, July 19, 1873, or not?

A. I don't think it was, to the best of my recollection.

Q. 527. I wish to know whether you used any of the said $425 in payment of that Neidhamer judgment or not. What is the fact?

A. I did. I am under the impression that I paid a part of that judgment—several hundred dollars—out of the money that I received from the Hauck purchase. I went to see the agent of Neidhamer, named Wells—I think his first name was James—he told me that the judgment was all paid at one time. I did not recollect that, but whatever was paid, was paid out of that Hauck money; I am positive of that.

Q. 528. Do you recollect whether or not the judgment was fully paid off and satisfied by that payment?

A. I didn't remember that it was at that time. The date I didn't remember, but I know it was paid and satisfied about that time.

Q. 529. Perhaps you did not fully understand my question. You have testified that you paid some of the Hauck money on that Neidhamer judgment. What I now want to know is this, to wit: whether that payment which was made with the Hauck money was the last payment on the

Neidhamer judgment, and which satisfied and discharged said judgment?

A. I don't remember that. The way I recollected was that I had paid the greater portion of it. I went to see him, and he said it was all paid at one time; and, if that is so, I am satisfied it was all paid out of that money.

Q. 530. Do you recollect whether they were pressing for the money on that judgment at the time when you made that payment or not?

A. Yes, sir; and before. He had asked me a number of times; that is, a year or two before.

Q. 531. Why had you not paid it when he asked you before?

A. For the reason that I didn't have the money.

Q. 532. Had the interest accumulated on that judgment, or had you kept it down?

A. I paid some interest on it—the first year or two; afterwards there was interest that I did not pay. Part of the interest I know was satisfied at the time I made the payment—at the time the judgment was satisfied.

Q. 533. Please look at the receipt I now hand you, dated July, 1873, and state whose signature is attached to it, and what transaction it relates to.

A. It is Dr. J. D. Bowman's signature, and relates to the receipt of money on a judgment bond that he held against me.

[*By consent, the following copy of the receipt is put in evidence, the original to be produced when called for:*]

"Rec'd July, 1873, of Dan'l Drawbaugh, forty-five dollars on judgment bond.

J. D. Bowman."

Q. 534. Do you recollect whether you paid that money out of the money you received from the Hauck sale?

A. Yes, sir; I did.

Q. 535. In whose handwriting is that receipt?

A. It is the same handwriting as the signature—that of Dr. Bowman,—in my judgment. I think he wrote it at the shop. I remember of paying him the money and getting a receipt, but I didn't remember of him writing it.

Q. 536. How came you to be indebted to Dr. Bowman at that time?

A. For medical attendance. He was my family physician for several years.

Q. 537. In "Exhibit Drawbaugh judgments," I find a judgment entered up in February, 1873, in favor of Dr. Bowman against you, for $122.67. Was that the judgment on which that $45 was paid?

A. Yes, sir.

Q. 538. Please look at this other receipt, dated August 1st, 1873, which I now show you, and state in whose handwriting it is and whose signature is attached to it?

A. It is the signature of Dr. J. D. Bowman; I take the body of the receipt to be in his handwriting. It is for $45.

[*By consent, the following copy of said receipt is put in evidence, the original to be produced when called for:*]

"$45.

Rec'd August 1st, 1873, of
Daniel Drawbaugh,
Forty-five dollars on note of 1872.
J. D. BOWMAN."

Q. 539. Why did you not pay Dr. Bowman for his professional services as they were rendered, instead of allowing his bill to run up and him to recover a judgment against you?

A. Because I didn't have the money. I had no other reason.

Q. 540. Please look at another receipt which I now hand you, dated July 24, 1873, and state whose signature appears to it, and when and for what the money was paid.

A. G. W. Beelman's signature; that is a bill of $7 20 that I paid for groceries. The money was paid at the time the receipt is dated. I don't remember when it was contracted for.

[*By consent, the following copy of said receipt is put in evidence, the original to be produced when called for:*]

"HARRISBURG, *July* 24, '73.

MR. DANIEL DRAWBAUGH,

Bought of G. W. BEELMAN.

	$7 20

Rd. pymt.,
G. W. BEELMAN."

LEPHONE COMPANY,-2

Q. 541. One item of the bill is charged as of August 1. Do you remember what August that was?

A. I do not; but it might have been a previous bill—a year before that; I don't remember.

Q. 542. Might this bill, or might it not, have been paid about the first of August, 1873, its real payment being shown by the last date instead of the first?

A. I couldn't say. I don't know whether it was or not. It might have been.

[*The examiner by consent certifies that the last item of the bill, with the footing, the words "Rd pymt" and the signature, appears to be written with the same kind of ink, which is slightly different in color from that used in the body of the bill.*]

Q. 543. Please look at the promissory note which I now show you, dated April 26, 1873, and state whose signatures are attached to the note, and who paid the note.

A. George W. Kissinger's signature and mine. I paid the note.

Q. 544. That note became due May 26, 1873. Do you remember whether it was paid at maturity or afterwards?

A. I couldn't positively state when it was paid, but I think it was paid at the time I got that Hauck money. I know it would have been paid if it had been presented, and Mr. Leonard is a man who generally presents bills pretty often.

Q. 545. How came you to make that note? What was the transaction?

A. I bought my flour and feed from Mr. Leonard. I think it was contracted in that way for flour and feed out of the mill.

Q. 546. How came Kissinger to sign it?

A. I have forgotten that. Part of it may have been a bill that I owed Kissinger in the store. I don't know why he should have signed it, unless he was security; I don't know.

[*By consent, the following copy of said note is put in evidence, the original to be produced when called for:*]

"$60.00. *April* 26, 1873.

Thirty days after date, for value received, we promise to pay Geo. Leonard, or bearer, the sum of sixty dollars, with interest, and without defalcation or stay of execution. And we do hereby confess judgment for the above sum, with interest and all costs of suit, a release of all errors, and waiver of all rights to inquisition and appeal, and to the benefit of all laws, exempting real or personal property from levy and sale.

GEO. W. KISSINGER,
DANL. DRAWBAUGH."

[NOTE.—*The names are cancelled by XX marks.*]

Adjourned until Wednesday, December 28, 1881, at 2.30, P. M.,

When, on account of the death of the son of Mr. Drawbaugh, a further postponement until January 10, 1882, was agreed upon by counsel.

January 10, 1882, 10 *o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Smith and Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

Examination of Mr. Daniel Drawbaugh by Mr. Hill continued:

Q. 547. From the time when the Haucks made their purchase in July, 1873, to the time when you moved to Mechanicsburg, about the 1st of April, 1876, what was your financial condition—were you or were you not making money enough to pay your necessary expenses and keep even with the world?

A. No, sir; I wasn't making sufficient money to keep my family. I was making debts—had contracted debts before that, was contracting them all the time, and couldn't meet them.

Q. 548. Daniel Fettrow, a witness on behalf of Defendants, has testified in effect, that he purchased your blacksmith-shop and dwelling-house, at Eberly's Mills, and got the deed thereof on the first of April, 1876. That the terms of sale were to be cash on April 1st, 1876, less the amount of incumbrances; and that the agreement for the sale was made in August, 1875. Is that substantially in accord with your recollection or not?

A. Yes, sir; with the exception that I had forgotten the day of making the contract; I didn't remember the day, but it was about that time.

Q. 549. I have in my hand a small paper containing two separate writings, one of which purports to be a receipt and the other a promissory note. Will you please examine the paper and state if you know in whose handwriting it is, and by whom the note and receipt were signed?

A. The upper part, or receipt, is in the handwriting of my brother, J. B. Drawbaugh, and signed by myself—Daniel Drawbaugh. The note is in my handwriting and signed by me.

[*By consent, a copy of said receipt and note is put in evidence, as follows, the original to be produced when called for:*]

"Received Eberly's Mills Sept. 2nd 1875, of Daniel Fettrow, fifty Dollars on Property.

Dan'l Drawbaugh.

Sixty Days after Date I promise to pay to Dan'l Fettrow one hundred Dollars with interest for value received.

January 28th, 1876. Dan'l Dra" [*this torn out.*]

Q. 550. State whether you received fifty dollars from Mr. Fettrow on the second day of September, 1875, as evidenced by said receipt.

A. Yes, sir; I did.

Q. 551. For what was the one hundred-dollar-note of January 28, 1876, given?

A. It was given to pay off money borrowed for paying on an article of agreement on property purchased from E. W. Wise.

Q. 552. What I mean is this—did you borrow a hundred dollars from Mr. Fettrow at that time, or was the note given to pay an antecedent debt to Fettrow?

A. I borrowed the money at that time, for the purpose of paying on an article of agreement for the purchase of property from E. W. Wise.

Q. 553. Please look at the note, which I now hand to you, and state in whose handwriting the signature is or was.

A. It is my handwriting, or was; "Dan'l" is there yet; the balance has been torn off.

[*By consent, a copy of the note and its indorsements is put in evidence, as follows, the original to be produced when called for:*]

"$\$125\frac{00}{100}$ Mechanicsburg, Pa., *Jan.* 1*st,* 1876.

Thirty days after date I promise to pay to the order of George Wise, at the First National Bank of Mechanicsburg, Pa., one hundred and twenty-five dollars, without defalcation, for value received. Credit the drawer.

DAN'L" [*this torn out.*]

[*The indorsement is as follows:*]'

"Received Jan. 29, 1876, on within note, Ninety-five Dollars.

E. W. WISE,
Pr Geo. Wise."

Q. 554. It appears that on the 29th of January, 1876, you paid Mr. Wise ninety-five dollars on account of said note. Where did you get the ninety-five dollars to pay Mr. Wise?

A. I got that from Daniel Fettrow. To the best of my recollection, that is the money I got on the note that was shown here previous to this last note.

Q. 555. Was that note to Mr. Wise made at the head of the article of agreement between Mr. Wise and you, to which you have referred above?

A. Yes, sir; I think it was.

Q. 556. After paying the ninety-five dollars upon that note, thirty dollars appear to have remained due upon it. Do you remember when that thirty dollars was paid?

A. I don't remember, but I think it was paid before the first of April, 1876.

Q. 557. Mr. Fettrow has testified that he was to pay twenty-two hundred dollars for the property which he purchased of you, and that he actually paid you twelve hundred dollars out of the twenty-two hundred dollars, but retained the balance by reason of incumbrances on the property. Is that in accordance with your recollection or not?

A. Yes, sir; it is. There was a judgment of a thousand dollars on the property, which he retained out of the whole amount of twenty-two hundred dollars.

Q. 558. Did he come to time with his payment of the twelve hundred dollars on the first of April, 1876, as he had agreed?

A. Yes, sir; he did.

Q. 559. Then, as he had already paid you fifty dollars in September, and loaned you one hundred dollars in January, I suppose the amount which you actually received from him on the first of April, 1876, was ten hundred and fifty dollars. Am I correct or not?

A. Yes, sir; the amount—the one hundred and fifty dollars—was deducted from the twelve hundred dollars.

Q. 560. Captain J. A. Moore has testified (defendants' printed record, page 649 [621]) that he paid you, on the first day of April, 1876, one hundred and nineteen dollars and ninety-four cents. Is that in accordance with your recollection ?

A. I hadn't remembered the amount, but I remember of him paying me money.

Q. 561. When did you complete the transaction of purchasing the Mechanicsburg property which you bought from Mr. Wise, and to which the agreement related, that you have spoken of?

A. I don't remember the date, but I think the date of the bargain was in the fall or winter of 1875. The transaction was completed, and I got the deed, on or about the first of April, 1876.

Q. 562. What amount of cash did you have to make up to Mr. Wise on the first of April, 1876, the day when you got that deed?

A. One thousand dollars, less the amount paid on the note of January 1st, 1876.

Q. 563. What amount did you agree to pay for the Mechanicsburg property ?

A. Seventeen hundred and forty dollars.

Q. 564. Then the deferred payments on that property amounted to seven hundred and forty dollars. Is that the fact ?

A. Yes, sir.

Q. 565. How was that deferred payment, or how were those deferred payments, amounting to seven hundred and forty dollars, secured to Mr. Wise ?

A. By three judgment notes, to be paid in three annual payments.

Q. 566. In "Exhibit Drawbaugh judgments," I find the record of three judgments, numbered respectively 580, 581, and 582, April Term, 1876, E. W. Wise *vs.* Daniel Drawbaugh, on three notes, dated April 1st, 1876, two of them being each for two hundred and forty-six dollars and sixty-seven cents, with interest, and the third being for two hundred and forty-six dollars and sixty-six cents, with interest Were those the three judgment notes referred to in your last answer ?

A. Yes, sir.

Q. 567. By an entry in said record "Exhibit Drawbaugh judgments," it would appear that, on the 9th day of April, 1877, two hundred dollars were paid to the prothonotary on said judgment, No. 580. Was that the fact?

A. Yes, sir.

Q. 568. Who paid that two hundred dollars to the prothonotary?

A. I did.

Q. 569. An entry in the same record shows that on the 6th day of April, 1878, sixty-seven dollars and twenty cents were paid in full satisfaction of that judgment, No. 580. Who paid that sixty-seven dollars and twenty cents?

A. I paid that.

Q. 570. Another entry in the same exhibit shows that on the 6th day of April, 1878, two hundred and thirty-two and eighty one-hundredths dollars were paid on said judgment, No. 581. Who paid that last-mentioned sum of two hundred and thirty-two and eighty one-hundredths dollars?

A. I paid that. The two payments were paid on the same day.

Q. 571. By an entry in the same exhibit, I find that Dr. J. D. Bowman had obtained a judgment against you, No. 99, of April Term of 1873, for one hundred and twenty-two and sixty-seven one-hundredth dollars, and costs and interest, which judgment was satisfied by a paper filed in the prothonotary's office April 3, 1876. Do you remember whether you paid something on that judgment at about that time, April 3, 1876, or not?

A. Yes, sir, I did; but I don't remember the amount I paid.

Q. 572. Did you then pay the balance that was due on the judgment, whatever that balance was at the time?

A. Yes, sir.

Q. 573. By the same exhibit, I find that D. H. Good had obtained a judgment against you, No. 139, of January Term, 1876, for twenty-seven and eighty-one one-hundredths dollars, with interest and costs, to wit: by the filing of a transcript of a Justice's judgment, dated September 6, 1875, upon which execution had been issued, and returned *nulla bona;* and that said judgment of the Cumberland Common Pleas was satisfied in full by a paper filed April 3, 1876. Do you remember whether you paid that last-mentioned judgment about that time or not?

A. Yes, sir; I remember that I did, but I didn't remember the exact amount of it.

Q. 574. Do you remember where you got the money with which you paid D. H. Good's judgment, and the balance of J. D. Bowman's judgment, above referred to?

A. Some money that I got from Captain Moore and Daniel Fettrow. I didn't have any other money; for that reason I know.

Q. 575. State whether or not you have any recollection of the condition of your accounts with George Leonard and with Dr. Criswell, at about the time when you received the money from Daniel Fettrow, early in April, 1876?

A. I owed them money. I think I paid Dr. Criswell, in April, about forty dollars; and I also paid Leonard, but I don't remember the amount I paid Leonard. I might state further that I often paid Leonard parts, but I don't remember whether I paid him the full amount of what I owed him that spring or not.

Q. 576. Do you recollect whether or not you let Dr. Criswell have anything on account, besides money, that spring?

A. I think there was a set of wagon axles, but I don't recollect whether that was included in the forty dollars, or not.

Q. 577. What is your best recollection and belief, as to the amount of money you paid George Leonard, at that time?

A. It may have been forty, fifty, or sixty dollars. I don't remember the amount, indeed.

Q. 578. After paying all these debts out of the money received from Mr. Fettrow and Captain Moore, as aforesaid, what did you do with the balance of that money left in your hands?

A. I may have bought necessary things for the family, and paid other floating debts. That didn't near pay all the debts I had at the time; not one quarter of the debts.

Q. 579. How long did that money last you after the first of April, 1876, before it was all paid out?

A. I couldn't exactly say, but I don't suppose I had a cent of it three weeks after I received it; because I know I contracted debts that spring; in fact, the same day that I moved to Mechanicsburg.

Q. 580. Did you move to Mechanicsburg before or after you received the money from Fettrow?

A. Before. It may be, a few days or a week before.

Q. 581. What was your financial condition from the first of April, 1876, till the latter part of March, 1878?

A. I needed money very badly; I know that.

Q. 582. State whether, during that time, you did or did not make enough money to support your family?

A. I did not.

Q. 583. Jacob E. Shettel has testified (page 220 [210] of Defendants' printed record) that on the first day of April, 1878, the Electric Clock

Company paid you five hundred dollars. Is that in accordance with your recollection, or not?

A. Yes, sir; they paid me that amount, I know.

Q. 584. We have already seen that on the 6th of April, 1878, you paid moneys amounting to three hundred dollars on the Wise judgments. Where did you get that three hundred dollars that you paid on the Wise judgments at that time?

A. That three hundred dollars was paid out of the money I received from the Clock Company.

Recess for dinner until 2 o'clock, P. M.

January 10, 1882.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 585. I hold in my hand a note for $103 and interest, dated December 31, 1875, and payable to George Leonard. The signature is torn off, but the note is marked on the back "D. Drawbaugh note $103." Do you know what that note was for, and by whom it was signed?

A. That note was for a matter of goods that I got out of the mill —flour, feed, &c.; that was my signature; I know that; it is now torn off.

[*By consent, a copy of said note and its endorsements is put in evidence as follows, the original to be produced when called for:*]

"$103.00. HARRISBURG, PA., Dec. 31, 1875.

One day after date I promise to pay to Geo. Leonard, or assigns, the sum of one hundred and three one hundredth dollars, without defalcation, for value received, with interest. And further, I do hereby authorize and empower any attorney of any Court of Record of the State of Pennsylvania, or elsewhere, to appear for and enter judgment against me for the above sum of money, with or without declaration, with costs of suit, release of errors, without stay of execution, and with ten per cent. added for collecting fees; and also waive the right of inquisition on any real estate that may be levied upon to collect this judgment note, and I do hereby voluntarily condemn the same and authorize the prothonotary to enter upon the *fieri facias* our said" (*this, and signature torn off.*)

"and I do hereby further agree that said estate may be sold upon a writ of *fieri facias*, and I do hereby waive and release all relief from any and all appraisement" (*torn off*) "laws of any State now in force or hereafter to be passed, and I do also waive the benefit of the present and any future Bankrupt law that may be passed by the" (*torn off.*)

"Signed, sealed and delivered in presence of—" (*signature torn off*)

[*The endorsements on said note are as follows:*] "March 31, 1877, interest paid up till date." "April 3, 1878, paid on the within note fifty dollars."

"Paid on the within note ten dollars, Feb. 25, 1879."

"Paid on the within note twenty dollars, April 1, 1879."

Memorandum on the back: "D. Drawbaugh note, $103.00."

Q. 586. Do you know the handwriting in the body of the note and the endorsements?

A. I don't know. The first endorsements are in the handwriting of George Leonard, but the face of the note does not appear to be in the same hand. The last receipt on the back of the note is in my handwriting. All the rest are in that of Mr. Leonard.

Q. 587. One endorsement on the note represents that on the 3d day of April, 1878, $50 were paid on the note. Was that the fact or not?

A. Yes, sir; I take it by the note—I don't remember. I remember paying him money at so many different periods. That was money received from the Clock Company.

Q. 588. Did you ever have occasion to become indebted to Mr. W. S. Dellinger, for flour, feed, &c., from the mill while he was running it?

A. Yes, sir; I had owed him some pretty large bills.

Q. 589. What was the state of your account with him at the time the clock company paid you the five hundred dollars, to wit: April 1, 1878?

A. I paid him that spring in the neighborhood of a hundred dollars. It may have been a little more or a little less.

Q. 590. Where did you get the money to pay him?

A. That was from money that I got from the Clock Company.

Q. 591. How long after you got the money from the Clock Company was it that you paid Mr. Dellinger?

A. To the best of my judgment, in the course of a few days, or, perhaps, it might have been a week.

Q. 592. Please look at the receipt which I now show you, and state in whose handwriting it is, and by whom it is signed, and what transaction it refers to.

A. It is a receipt written and signed by Wilson Miller, a party who had a coal-yard at White Hill, near my place. That is for coal that I got, to the best of my recollection, in the fall or winter of 1877—1878.

[*By consent, the following copy of said receipt is put in evidence, the original to be produced when called for:*]

" *White Hill*, Cumb. Co., Pa., *Apr.* 3 1878.
Mr. Daniel Drawbaugh. Bought of [Dan. Drawbaugh crossed out] *J. R. Miller.*
Practical machinist, small machinery; patent office models, electric machines, &c., a specialty.
Coal & Freight 12.20.

Received Payment,
J. R. Miller,
pr. W. Miller."

[*This is written on a printed bill-head of Daniel Drawbaugh. The parts above printed in italics are in manuscript. The printed words,* "*Dan. Drawbaugh*" *after* "*Bought,*" *are crossed out with a pen, and the words J. R. Miller written in place of them.*]

[*Memorandum on back,*] "Receipt of Wilson Miller."

Q. 593. Do you recollect where you got the money to pay Mr. Miller, as set forth in that receipt?

A. I suppose it was money I got from the Clock Company. I know I didn't get any other money that spring.

Q. 594. Here is another receipt, dated April 3, 1878, the same day as the last one. In whose handwriting is this receipt, which I now show you, and its signature?

A. I don't know whose handwriting the body of the receipt is. The signature is that of Jeremiah Fry. That is money I paid him out of that money I got from the Clock Company. I am confident of that; I remember paying him.

[*By consent, the following copy of said receipt is put in evidence, the original to be produced when called for:*]

"April the 3, 1878.
Received of Daniel Drawbaugh, Four Dollars and thirty-one cents in full on settlement up to Date.

JEREMIAH FRY."

[*Memorandum on back,*] "Receipt of Jery Fry."

Q. 595. After paying out of the $500 received from the Clock Company the various sums above mentioned, amounting in all to over $460, what did you do with the remainder of the Clock Company money, amounting to from $30 to $40?

A. I suppose I paid some other small debts, and bought, perhaps, some necessary things for my family; I can't just remember.

Q. 596. Mr. Jacob E. Shettel has testified, on page 220 [210] of Defendants' printed record, that about a week or ten days after the Clock Company paid you the $500, you told him that you didn't have $5 left out of the whole $500. Do you recollect making that statement to him?

A. Yes, sir; while I was driving over this bridge in a buggy; he also loaned me a small sum of money, too, at the same time;—I mean the bridge across the Susquehanna, called the "Harrisburg bridge."

Q. 597. Was the statement true?

A. Oh, yes; certainly, it was true.

Q. 598. I have here, a note dated March 13, 1877, for $15.50, payable to John Rennard, eleven months after date; the signatures are torn off, but the note is marked "D. Drawbaugh," on the back. By whom was that note signed, and what was it given for?

A. That note was signed by me, and countersigned, or signed again, by J. B. Drawbaugh, my brother; it was given for two hogs, or rather, pigs, that I bought at a public sale; the note was in the Mechanicsburg Bank; I didn't pay the note when it matured, but paid it in the spring of 1878.

Q. 599. Why did you not pay it at maturity?

A. I don't suppose I had the money.

[*By consent, the following copy of said note, and its endorsements, is put in evidence, the original to be produced when called for:*]

"$15.50. MECHANICSBURG, PA., *March* 13, 1877.

Eleven months after date, we or either of us promise to pay to the order of John Rennard, at the First National Bank of Mechanicsburg, Pa., the sum of Fifteen dollars and 50 cts. without defalcation, for value received, with reasonable fees for collection, if not paid at maturity.

DANL. [*this torn off.*]
J. "

[*Endorsed*] "John Rennard."

[*Memorandum on the back,*] "2047, D. Drawbaugh, $15.^{50}$ Feb. 16."

Q. 600. Do you remember where you got the money with which you paid that note?

A. No; I don't remember; it may have been money that I got from the Clock Company; I don't know of any other.

Q. 601. Mr. E. W. Chellis has testified, that, early in January, 1879, about the time that he went into the faucet business with you and Dr. Moffit, you told him you must have $250, as you were in debt and they were pressing you for money that you owed, and that he thereupon gave you a check for $250, on the 7th of January, 1879; do you remember that transaction?

A. Yes, sir; I do.

Q. 602. Do you remember what you did with that money?

A. I used it for paying debts, and for some necessary things for my family, too; I used some of it for clothing for myself and family.

Q. 603. How long was it before you were out of money again?

A. I don't know; it wasn't very long.

Q. 604. Do you recollect having to borrow small sums from Chellis afterwards?

A. Yes, sir; quite a number of times—from a half dollar to five dollars at a time.

Q. 605. What is your recollection, as to how long it was after you got the $250, before you had to borrow from Mr. Chellis again?

A. I don't think it was a week—hardly a week.

Q. 606. A mortgage dated April 19, 1879, is recorded in the office of Recorder of Deeds in Cumberland County, Pennsylvania, in which you mortgaged your Mechanicsburg property to Mr. E. W. Chellis for $337; what was that transaction, and why did you have to mortgage your property to Mr. Chellis to secure him $337, at that time?

A. To procure money to pay the last, and a portion of the second judgment on the Mechanicsburg property.

Q. 607. What became of that last judgment on the Mechanicsburg property; that is to say, the last of the Wise judgments; was it paid, or was it assigned to Chellis?

A. It was paid; it wasn't assigned to Chellis; I gave him a mortgage for the amount, $337; that is the way I understand it.

Q. 608. It has been stated, that, at times heretofore, you have assisted other inventors in drawing applications for letters patent upon their inventions; is such the fact?

A. Yes, sir; I did; I assisted in a few cases.

Q. 609. How much money did you get for that sort of work?

A. I don't remember how much; I remember that in two cases, I got $20 each, for making the drawings and writing the specifications; the specifications were re-written after I had written them.

Q. 610. Did you ever act as attorney for any other inventor, in doing his business at the Patent Office?

A. No, sir; not to the best of my recollection; I did not.

Q. 611. So far as you prepared specifications of other inventors' inventions, was it for the purpose of filing in the Patent Office, or for the purpose of assisting their Attorneys in properly getting at their inventions?

A. In two cases it was for the purpose of filing; that is, I made the drawings and wrote the specifications, and they made their applications themselves.

Q. 612. What were those inventions in those two cases?

A. The one was a check spring for a wagon, to support weak springs—to support an elliptical spring; the other was a journal for a reaper bar; I think it was styled a reaper bar attachment.

Q. 613. Were those two specifications filed in the Patent Office as you wrote them, or were they afterwards amended by others?

A. I cannot say; that I do not know; the spring, I think, was applied for as I drew it, but the other I cannot say.

Q. 614. You have taken out a number of patents yourself; state whether or not you ever drew a specification to be filed in the Patent Office, on any of your own inventions?

A. No, sir; I never did.

Q. 615. State whether or not you ever took out a patent with your own money?

A. I never did.

Q. 616. In taking out a patent, how did you obtain the money for paying the Government fees, and for procuring the services of an Attorney to do the work?

A. I would give an interest out to other parties, for furnishing the money to procure the patents.

Q. 617. Why did you take that course in procuring your several patents?

A. To get the money for taking out the patent.

Q. 618. Were you obliged to do it, in order to get the money to take out the patents?

A. Yes, sir; for I didn't have the money.

Q. 619. How much schooling did you ever have in your life?

A. I could hardly say; three, four, or perhaps five winters; that is, sometimes just part of a winter.

Q. 620. How old were you when you last went to school?

A. As near as I can remember, I was fifteen or sixteen years old; I may not have been as old.

Q. 621. Did you go to an Academy or High School, or only to a Common School?

A. Just Common Schools; and when I went they were very common.

Q. 622. Why did you never draw specifications to be filed in the Patent Office on your own inventions?

A. I didn't think I was competent for drawing good specifications; that is as near as I can state it.

Adjourned until January 11, 1882, at ten, A. M.

January 11, 1882, ten o'clock, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

Q. 623. Mr. Jacob H. Renneker has testified, (page 247 [236] of Defendants' printed record,) that in May, 1877, you wanted to trade him, and did trade him, a bureau and secretary combined, for provisions for your family; do you remember that transaction?

A. Yes, sir; I do.

Q. 624. Why did you trade off your bureau and secretary at that time?

A. I needed provisions for my family.

Q. 625. Had you no means to get such provisions, except by trading away your household furniture?

A. No, sir; not at that time—I can't—I had no other means.

Q. 626. From the time when you exhausted the $500, which you received from the Electric Clock Company, down to the middle of the year 1880, were you laying up money, or did it take all that you made to pay your living expenses?

A. I didn't lay up any money. I didn't make enough to keep my family, in that time.

Q. 627. What was your condition, as to being in debt or free from debt during that time?

LEPHONE COMPANY,-2

A. I was in debt all the time, and contracting more.

Q. 628. State whether, from the time when you borrowed the money from Mr. Ditlow, to pay the installment called for by the Gorgas Faucet Company, or old Drawbaugh Pump Company, as you have testified, down to the middle of the year of 1880, there was, or was not, any time during which you were unembarrassed by debt?

A. There was not. I was in debt all that time.

Q. 629. During that time, or any part of it, did you ever contemplate selling your little homestead to realize means to pay your debts, and to relieve yourself in your business?

A. Yes, sir; I did. I spoke to my wife with respect to it, but she wouldn't consent unless I would sell and buy another place.

Q. 630. When was that, that you spoke to her about it? Was it before or after you sold the Eberly Mills homestead and bargained for the Mechanicsburg place?

A. Before—a number of years before that, I had contemplated selling. I had offered it a number of times to different parties.

Q. 631. When you consulted her about selling, and she declined, except on condition that you should procure another homestead, did you tell her your reasons for wishing to sell, and what you proposed to do with the proceeds of sale, if made?

A. Yes, sir; I told her that I would like to sell and pay off my debts and get into a business that I could make more money in than I was making; that I was hampered; that I had a number of improvements that I wanted to secure.

Q. 632. What improvements did you refer to by that?

A. The telephone for one, and the clock, and a faucet that I had—a measuring faucet.

Q. 633. Why did you transfer your homestead from Eberly's Mills to Mechanicsburg in 1876?

A. For the purpose of getting into business at Mechanicsburg. I had contemplated working for S. &. G. Hauck.

Q. 634. Have you ever owned any other real estate except the homestead at Eberly's Mills and the one which you purchased at Mechanicsburg, after selling the Eberly's Mills property?

A. No, sir.

Q. 635. What other property did you own from 1869 down to the middle of 1880 or at any time intervening, except the homestead and the household furniture therein and your tools?

A. No other.

Q. 636. In exhibiting your various telephones to other persons all along during the time from 1868, and after you had made improved instruments, what was your custom as regards selecting from your various instruments an instrument to show them, or to operate for them? Did you generally exhibit the original instruments, or improved forms, or both?

A. I would generally give an explanation with the improved forms—showing the principle. Then I would show the original to show the progress I had made in the improvements.

Q. 637. David M. Ditlow has testified (Defendants' printed record, page 598 [573]) that about the year 1872, he went to your shop and you showed him and talked to him through a machine with tin tubes at each end, and a wire wrapped with string. You have not mentioned such machine in your testimony, if he has described it correctly. What, if anything, do you remember about it?

A. I can't remember of ever having a machine of that description. I think he has reference to "Exhibit B."

Q. 638. Some of the witnesses for the defense have testified to seeing you use a paper funnel, or something of that kind in connection with your earlier telephone instruments. What is your recollection about that?

A. I did; yes, sir.

Q. 639. Describe how you applied it, and why?

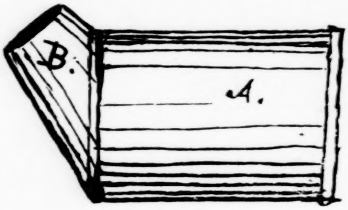
A. On the instrument "B" I fastened a pasteboard formed into a tube; the lower end of it bevelled off and fastened to the end of the tin tube farthest from the diaphragm—the end at which you place your ear.

Q. 640. Please make a sketch showing the application of said tube to the tin box instrument.

[*Witness makes a sketch and then says:*]

A. That is as near as I can remember.

[*Mr. Hill puts the sketch in evidence to be marked "exhibit D. Drawbaugh sketch, No.* 4."]



Q. 641. In the above sketch you have, at my request, marked one part with the letter A, and the other part with the letter B. What do those parts respectively represent?

A. A represents the case, or the body of the instrument, and B represents the paper funnel or tube.

Q. 642. Some of the witnesses have referred to seeing diaphragms on the instruments, which diaphragms they thought were made of tissue paper; what was the fact?

A. I don't think that I ever made any diaphragms out of tissue paper; I don't remember; I generally used animal membrane—hog's bladder; that looked something like oiled tissue paper; I think one of them says oiled tissue paper.

Q. 643. Daniel W. Smith testified, on page 74 [71] of Defendants' printed record, that he made an affidavit on one occasion when you and Mr. Jacobs were present, and Mr. Jacobs administered the affirmation; what is your recollection about that?

A. I think Mr. Smith is mistaken about that; Squire Lee administered the affirmation.

Q. 644. Henry C. Springer testified, on page 191 [183] of Defendants printed record, that about two months after April 1st, 1876, you showed him the two little magneto instruments, "D" and "E," and told him that you had improved the machine, and could talk both ways then; and that the first instruments, that you showed him during the two months prior to that time, would only talk one way; were the two little magneto instruments, "D" and "E," the first instruments that you made that would talk both ways, or not?

A. No, sir; I had other instruments; instrument "C" was one, and "I" was another, but "C" was not as well adapted as a receiver, as it was as a transmitter. I suppose I wanted to have him understand that those small magneto instruments could be handled more easily from the mouth to the ear.

Adjourned for dinner until 2.30, P. M.

January 11, 1882, 2.30, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Daniel Drawbaugh by Mr. Hill continued:

[*Mr. Hill offers in evidence, as "exhibit Drawbaugh judgments, full re-*

cord," a certified copy from the records and proceedings enrolled in the Court of Common Pleas, in and for the County of Cumberland, and State of Pennsylvania.]

Q. 645. Some of the drawings made by Mr. Knight, and which have heretofore been put in evidence in this cause, to wit: "Exhibit C drawing," "Exhibit reproduced I drawing No. 1," "Exhibit M drawing," "Exhibit reproduced L drawing," "Exhibit reproduced M drawing," contain certain notes, each marked "note," and signed by W. H. H. Knight; please examine said several notes and see if the statements contained therein are correct?

A. The note on "Exhibit C drawing" is correct.

The note on "Exhibit reproduced I drawing" is correct.

The note on "Exhibit M drawing" is correct.

The note on "Exhibit reproduced L drawing" is correct.

The note on "Exhibit reproduced M drawing" is also correct.

[*Mr. Hill offers in evidence a tracing of the front elevation on "Exhibit J drawing, sheet 1;" also a tracing of the rear elevation on "Exhibit reproduced P drawing sheet 2," also a tracing of the front elevation on "Exhibit reproduced P drawing, sheet 1;" the first mentioned tracing to be marked "Exhibit J circuits," the second tracing mentioned to be marked "Exhibit P circuits, No. 1;" and the third tracing mentioned to be marked "Exhibit P circuits, No. 2;" in which several tracings the route of the electric current is represented by lines of different colors.*]

Q. 646. Please examine these three tracings, which I have just put in evidence, and state whether you have carefully compared the circuit lines there shown, with the instruments intended to be represented; and if so, state whether the colored lines upon the tracings, accurately represent the route of the electric currents, under the different adjustments of the switches and battery connections?

A. Yes, sir; they do.

Q. 647. Were these tracings prepared under your direction?

A. I don't know that they were prepared under my direction; I examined them as they were prepared, and I traced the lines with a pencil, and they were afterwards traced with colors; I directed how they should be traced in colors.

Q. 648. When did you first have any information as to the alleged date of Alexander Graham Bell's invention of the telephone?

A. Not till about the year 1880,—about the time, or a little while before, this suit was started.

Q. 649. When did you first have any information about the alleged date of Elisha Gray's invention of the telephone?

A. That is more recent; that is, after I became acquainted with Bell's alleged invention; I can't positively say, but I know it was after that yet.

[*Mr. Hill offers in evidence an instrument to be marked "Exhibit reproduced B instrument;" also an instrument to be marked "Exhibit reproduced C instrument;" also an instrument to be marked "Exhibit reproduced F instrument;" also an instrument to be marked "Exhibit reproduced I instrument;" also an instrument to be marked "Exhibit reproduced L instrument;" also an instrument to be marked "Exhibit reproduced M instrument;" also an instrument to be marked "Exhibit reproduced P instrument."*]

Q. 650. Please state whether these instruments, which I have just put in evidence, have been made under your direction for the purpose of putting in evidence in this suit?

A. Yes, sir; they have.

Q. 651. Please state how they severally compare with the original machines of which they purport to be reproductions?

A. I have examined the reproduced drawings, and find them to compare correctly with the reproduced instruments.

Q. 652. You mean the reproduced drawings which have been put in evidence here and about which you have testified?

A. Yes, sir.

Q. 653. Do you mean to be understood that "Exhibit reproduced B instrument" is an accurate reproduction of the original instrument "Exhibit B," as it existed many years ago, as you have testified?

A. No, sir; as it was before—some time before, but not the original instrument; the original had a string which the reproduction does not have; the original instrument was represented in a drawing that I made here, while I was on the stand.

Q. 654. You testified that a year or two after you made the instrument "B" in its original form, with the diaphragm attached to the armature by a string, you changed it to the form represented in "Exhibit reproduced B drawing;" state whether "Exhibit B reproduced instrument" is or is not an accurate reproduction of the tin box receiver, as it existed at the time that change was completed?

A. Yes, sir; it is, with the exception that the magnet may not be exactly the same size, but the parts are the same; I mean the electromagnet.

Q. 655. Is there any difference that would make a difference of operation or result?

A. No, sir.

Q. 656. How does "Exhibit reproduced F instrument" compare with the old tumbler instrument, as the latter existed prior to 1871, when you used it in connection with instrument "C"?

A. It compares exactly, with the exception of a modification; I had it in two forms; that is, in one I had two metal posts, or a continued stirrup; and in another I had one, as represented partly in "Exhibit F drawing;" it compares in every other respect.

Q. 657. Am I to understand you that it is an accurate reproduction of one of the two original modifications or forms?

A. Yes, sir.

Q. 658. How does "Exhibit reproduced C instrument" compare with the original instrument "C," as the latter existed prior to July, 1873, when the Haucks purchased the faucet business?

A. It compares exactly, except that the permanent magnet is a little longer or larger, I think, than in the original; and the electro-magnets are a little shorter, I think.

Q. 659. State whether there is any difference that would produce difference of result or operation.

A. No, sir; I think not.

Q. 660. State whether or not "exhibit reproduced I instrument" is an accurate reproduction of one of the forms of original instrument "I," as the latter existed prior to the said Hauck's purchase.

A. Yes, sir.

Q. 661. Please state whether "exhibit reproduced L instrument" is an accurate reproduction of the original instrument marked "L."

A. Yes, sir; it is.

Q. 662. Please state whether "exhibit reproduced M instrument" is an accurate reproduction of the original instrument marked "M."

A. Yes, sir; it is.

Q. 663. Please state whether the "exhibit reproduced P instrument" is an accurate reproduction of the original "P" instrument.

A. It is in every respect, except the flexible tube. In the original, the flexible tube contained a spiral spring. In the reproduction, there is no spiral spring.

Q. 664. Why was the spiral spring omitted from the reproduction?

EPHONE COMPANY,-2

A. Because I had no wire of the right number to make it from at the time the instrument was made.

Q. 665. You have testified that the electro-magnet of "reproduced B instrument" is, or may be, of somewhat different size from the electro-magnet of the original instrument. Was that difference accidental or intentional?

A. It wasn't intentional. My brother made the electro-magnet, and the original instrument was not there at the time. I gave him the size from memory. I just guessed at it. I couldn't get at the size exactly.

Q. 666. You have also testified that the permanent magnet and electro-magnet of "reproduced C instrument" differ a little in size, as you think, from the corresponding magnets of the original instrument. Was that difference accidental or intentional?

A. It was not intentional. My brother also made them. The original magnets were not about—didn't have them. They had been mislaid or lost, or perhaps, had been changed in some other form. I gave my brother directions of the size of them by memory.

Cross-examined by Mr. Smith:

Cross-Q. 667. I understand you that prior to the spring of 1867, when the Drawbaugh Manufacturing Company was organized, and moved into the shop which you now occupy, you had had a shop in the basement of the house where you lived for many years. What business had you carried on in that shop?

A. Manufacturing stave-jointing machines and stave-cutting machines.

Cross-Q. 668. For how many years was that business carried on in that shop?

A. Some six, eight, or, may be, it might have been ten years. I can't just exactly state.

Cross-Q. 669. Had you carried on that business during the two or three years immediately preceding the spring of 1867?

A. No; I think not.

Cross-Q. 670. When did you discontinue that business?

A. I could ascertain that and give the dates, but I couldn't just say—about 1865 or 1866.

Cross-Q. 671. Can you tell about what amount of business you did per year while carrying on that business?

A. I couldn't now, exactly. For a number of the latter years that

I carried on that business it didn't amount to three or four hundred dollars a year—for a number of years.

Cross-Q. 672. Did you do any other work in that shop while you were manufacturing stave-cutters and stave-jointers?

A. Yes, sir; some other work.

Cross-Q. 673. What other work did you do during that time?

A. I done some repairing work; that is, repairing agricultural implements, threshing-machines, some little repairs on horse powers, and different other jobs that I cannot now enumerate—done some little in model making for different parties.

Cross-Q. 674. What kind of model-making was it that you did?

A. Models for parties for experimental purposes.

Cross-Q. 675. Do you recall the names of the parties for whom you made models, and the character of the models?

A. I can't now recall any. I made some models of my own, of inventions I was experimenting on then.

Cross-Q. 676. What models of your own do your refer to which you made during that period, while you were carrying on that stave-cutter and jointer business?

A. Models on a machine for feeding nail plates, and models of measuring faucets.

Crsos-Q. 677. Were you working on these last mentioned machines, during the latter years of the time during which you carried on this stave-cutter and stave jointer business?

A. I can't remember the dates. That bothers me a little. Some of those models for the measuring faucet were made between 1864 and 1866, somewhere. I could not give no very accurate date when I made them. I made the models of the nail machine prior to that, to the best of my recollection. I don't want to be too positive. Dates I am not very accuate in.

Cross-Q. 678. These were machines of your own invention, were they not?

A. Yse sir.

Cross-Q. 679. Was your work on them confined to the building of models, or did you build, or attempt to build, working machines?

A. I built one nail cutting machine with the feeder attached, and I also put up a few faucets, to show the working of the faucet. I didn't have the tools to work in a fast way. I only had one small hand lathe

LEPHONE COMPANY,-2

and a hand drill. The hand lathe was not my own. That Mr. Eberly had bought for me—had bought it, and let me work on it.

Cross-Q. 680. Can you give me any idea how much time you spent on the nail machine and the faucet, while you kept your shop in the basement of the house you lived in?

A. It would be a little hard for me to give the time I spent on it. I worked on it at different times. There were intermissions that I didn't work on the nail machine. I could get at the time I spent on the faucet nearer.

Cross-Q. 681. Please give the time as near as you can, that you spent on the faucet while your shop was in the basement of your house?

A. In making the models, patterns, and some of the experiments with it, I might have consumed two or three months, to the best of my judgment about it.

Cross-Q. 682. Can you give me any idea how much you expended for materials, in your experiments on the faucet, and in building the ones that you set up for trial?

A. I didn't expend any. There was another party that found the material—took an interest in it, and I done the labor. In the faucet it was Lafayette Croll. He now lives in the city here.

Adjourned until January 12, 1882, at ten, A. M.

January 12, 1882, 10.30, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbuugh by Mr. Smith continued.

Cross-Q. 683. Do you remember how many faucets you built, that you set up for trial, before you moved your shop from the basement of your house?

A. I could hardly say how many. It might have been six, or it might have been a dozen or more. The most of them were experimental—or all of them.

Cross-Q. 684. Were any of them sold, or put into the hands of other parties away from your shop for trial or practical use?

A. There may a few of them have been sold; I don't remember. There were some put out in the hands of other parties for trial, but the number I couldn't say.

Cross-Q. 685. Do you remember the names of the people, or any of the people who had them for trial?

A. The first one, I guess, was put in the store there at my place for trial. I am not positive who kept the store at that time. I think it was Lafayette Croll. I could get at dates more accurately if I had an account book that is lost. I have tried to inform myself, but couldn't get at it. I think Beelman and Houston, grocers in this city, had one or two. There may have been some others that I can't now think of.

Cross-Q. 686. Do you remember the names of parties who bought them, and the prices they paid for them?

A. The price I remember; they were to pay five dollars.

Cross-Q. 687. Did Mr. Croll make an arrangement with you to provide the materials for experimenting on the faucet, before you had actually constructed any of them?

A. Yes, sir; with the exception of the first experimental, or trial one, which was made of wood. I don't remember that we had any contract for the material of that one.

Cross-Q. 688. Did you make that one before you made any contract with Mr. Croll?

A. Some time, in the winter of the year 1865, I guess, he had molasses that he couldn't draw on account of the cold weather; he asked me whether I couldn't get up an arrangement or machine that would draw that without so much trouble; I told him I would think; that perhaps there might be a machine made. The next day, I think it was, I constructed a crude apparatus. I took it to his store, and we tried it. He was very much pleased with it; he told me he would like to have an interest in the apparatus. We then made a contract, that he should have an undivided half interest, find all material, and pay all expenses for taking out a patent, experimenting, and all expenses connected with it, for that undivided interest.

Cross-Q. 689. Was that contract understood to be limited to the experimenting that might be necessary, and to the taking out of the patent, or was it to apply to the manufacture of the instruments for sale, after the patent was obtained?

A. It was for both, I think; for the experimenting and the manufacture.

Cross-Q 690. How long did Mr. Croll retain his interest under that contract?

LEPHONE COMPANY,-2

A. I could hardly say; it may have been three or six months, or perhaps a year; it may have been more.

Cross-Q. 691. Did he sell his interest to any one? If so, to whom was it?

A. He did; he sold his interest to A. H. Gardner; or that was the understanding; that is, they told me so; but before that sale, I had sold my interest to A. H. Gardner—before Croll had sold his.

Cross-Q. 692. Where did Mr. Gardner live, what was his business, and where does he live now?

A. He lived at the same village at which I live now, Eberly's Mills; he was superintending, I think, an iron ore bank for Dr. Heck; he now lives at Steelton, Dauphin County, Penna.

Cross-Q. 693. How long did he continue to live at Eberly's Mills?

A. I could hardly say. At the time he made this contract I don't think he lived at Eberly's Mills; I think he boarded with a man by the name of Best, who lived about a mile from Eberly's Mills. He may have lived at Eberly's Mills six or eight years; it may have been more, or it may have been less.

Cross-Q. 694 While he lived at Eberly's Mills, how near was his home to yours?

A. It may have been a hundred yards—more or less—I can't say how much.

Cross-Q. 695. Will you state, as nearly as you can, at what time he made a trade with you for your half interest in the faucet, and in what way that trade came to be made, or what circumstances led to the trade?

A. The contract was made within a week or three after the first experimental machine was made, as near as I can remember. I can't answer as to what circumstances led to the trade; I don't know what circumstances.

Cross-Q. 696. If I have understood the testimony correctly, heretofore, I think Mr. Gardner obtained his deed some time in February, 1867, and gave you his note for $1000; had he paid you or furnished you any money before that time, on account of the faucet contract?

A. He gave me a note for a thousand dollars. The date of the deed I don't remember, and any promise of money before that I don't remember; if he had, I have forgotten. He had furnished me money before that for material and labor; that is, at the time Mr. Croll and he had the control of it.

Cross-Q. 697. Then, if I understand you, you got pay for all your labor on that invention, after Mr. Gardner made his contract with you; is that so?

A. They paid me for my labor, while they had it in their control.

Cross-Q. 698. How much did they pay you for your labor, or labor and material both?

A. I think they were to pay me a dollar or a dollar and a half a day; I don't remember the amount. They found the material.

Cross-Q. 699. I understand that when the Drawbaugh Company was organized, or while it was in existence, its business embraced pumps, as well as faucets. Were those pumps invented by you; if so, when did you make that invention?

A. That was the same invention as the faucet—the same principle; there was a modification in the construction; that was the only difference.

Cross-Q. 700. Was there more than one patent on the faucet and pump?

A. No, sir; only one There were two patents on faucets; that is, they were very dissimilar—the two faucets.

Cross-Q. 701. Were there two patents on the faucet that you sold to Croll and Gardner?

A. Yes, sir.

Cross-Q. 702. Can you state when these patents were applied for respectively, and when they were granted?

[*Mr. Hill says, that if the object of the question is intended to fix the dates of the applications and the patents, the question is objected to, as calling for secondary evidence.*

By consent of counsel, the dates are taken from complainants' moving papers on file, as follows: The dates for both patents are: applications, September 14, 1866; *patents, November 20th*, 1866.]

Cross-Q. 703. Were both these patents covered by your contracts with Croll and Gardner, and were they subsequently purchased by the Drawbaugh Manufacturing Company?

A. If I remember right, they were.

Cross-Q. 704. If I have understood the testimony correctly, you obtained from the parties who formed the Drawbaugh Manufacturing Company five thousand dollars, in addition to what you had obtained under the Croll and Gardner contracts; how came you to get this additional sum, after having sold the inventions to Croll and Gardner?

A. This patent—the original patent was divided into two parts; Croll and Gardner were to have the interest in the invention so far as it related to measuring molasses or other viscid liquids, and the Pump Company were to have the use of it for pumping aqueous liquids. I could produce written contracts showing that, if it is necessary.

Cross-Q. 705. Croll and Gardner, however, furnished the materials and paid for the labor covering both parts of the invention, did they not?

[*Objected to by Mr Hill as immaterial and irrelevant.*]

A. No, sir; I think not; just as far as related to faucets.

Cross-Q. 706. Who paid for the labor and material so far as related to pumps. I mean, labor and material expended experimentally, in making the inventions, before your sale to the parties who formed the Drawbaugh Manufacturing Company?

[*Same objection by Mr. Hill.*]

A. There wasn't much labor and material expended. I used a faucet as a pump; I enlarged the nozzle to apply a pipe. This instrument I can produce; it is marked a faucet.

Cross-Q. 707. In what way, and when, did your negotiations commence with the several parties who formed the "Drawbaugh Manufacturing Company"?

A. In the way, that I showed them, or that they had seen the faucet used as a pump; I can't give the exact time, but I think there was not much time between the close of my work for the faucet company, or Croll and Gardner, and my negotiations with the Pump Company.

Cross-Q. 708. When did you commence your experiments upon the nail feeder, to which you have referred?

[*Objected to as already fully inquired of, and testified to, yesterday.*]

A. I couldn't positively say how long. I think it was before I experimented with the faucet; but there were several patents taken out on that; at least, the dates I don't remember, but I could furnish the dates if required.

Cross-Q. 709. Did you, at the time when you commenced those experiments, or at any time during their progress, have any contract with any party, relative to these inventions—on the nail feeder?

A. Mr. Christian Eberly, at the time I commenced, became a partner; he furnished the money for the experiments and for procuring the patent, for which I gave him an undivided half interest. I mean the nail feeding device.

Cross-Q. 710. I wish you would reflect a few moments, and see if you cannot fix the time more nearly, when you made this contract with Mr. Eberly?

A. It was some time before the application was made for a patent. but the length of time before, I can't state.

Cross-Q. 711. You were to give your labor, I suppose, in making this invention, and Mr. Eberly was to furnish material?

A. Yes, sir; and at the same time he was to pay me a salary by the day. I think a dollar, or a dollar and a half a day.

Cross-Q. 712. Do you remember how much he paid you under that arrangement?

A. I don't remember of him paying me any money. I always took it out in mill stuff, flour, feed, &c., and meat and provisions for my family. At the end of each year, I always owed him money, I know that.

Cross-Q. 713. Do you remember about how much labor you did for which you were entitled to a dollar, or a dollar and a half a day from Mr. Eberly, under that arrangement?

A. No, sir; I don't know how much. I was not working on the nail-machine all the time. There was times that I did some other work.

Cross-Q. 714. Have you any means of ascertaining how much work you did for Mr. Eberly, and for which you were entitled to the compensation you have mentioned?

A. I may, perhaps, by referring, if they are not lost, to some small time or memorandum books that I had.

Cross-Q. 715. Have you been in the habit of keeping time books or memorandum books which show the time and manner in which you have been employed?

A. Yes; to some extent. I was not as particular as some in keeping books. I know I was a little negligent in keeping my accounts. The account book that I had for that time is now lost. The account book I kept at the house; and I often entered my work in a memorandum book that I carried in my pocket.

Cross-Q. 716. Have you ever rendered an account to Mr. Eberly of the time or labor expended on the nail feeding invention?

A. Yes, sir; we looked over some accounts. I had lost my book; that is, I had a number of memorandum books. We looked over them.

They took up a space, maybe, of a dozen or more years, and I remember of owing him a pretty big amount, and he said "we will square accounts." I owed him several hundred dollars, to the best of my recollection.

Cross-Q. 717. When was it that you had this settlement of which you have spoken?

A. I couldn't exactly state, it has been a good while ago. It might have been 1865, 1866, 1867, or some time about there. I could, perhaps, give the time by referring to some circumstances.

Cross-Q. 718. Will you ascertain, if you can, where this was, and also what the amount of Mr. Eberly's charge against you was, and also the period of time which his account embraced?

A. Yes, sir; I will try.

Cross-Q. 719. And do you remember down to how late a period your work on the nail feeder continued, under the arrangement with Mr. Eberly?

A. I couldn't give that accurately, either. It may have been down to 1869, 1870, or 1871. I might fix that by a circumstance—by asking Mr. McCormick. I had put up a machine at McCormick's nail factory at Fairview, on trial. That was about the last work done. I don't remember the time exactly, but I think it was between those years.

Cross-Q. 720. Will you please ascertain, if you can, when this last work was done?

A. Yes, sir; I will try.

Cross-Q. 721. Perhaps, in the meantime, you can state from recollection, whether you did any work on nail machines after the Drawbaugh Manufacturing Company went into operation?

A. I did; the former two or three years, perhaps.

Cross-Q. 722. Do you remember whether any nail machines were set up in the shop of the Drawbaugh Manufacturing Company?

A. There was no machine built. There was one set up in the basement story—the Drawbaugh Pump Company, it was then.

Cross-Q. 723. Where was that machine built, and at what time was it set up in the basement of the Drawbaugh Pump Company? How long did it remain there, and what was done with it while it was there?

A. It was built in the basement story of the house where I was living before I moved my shop to the lower shop. I couldn't accurately give the date when it was set up, as before stated. It may have been between 1868 and 1869. It remained there until within three, four, or five years ago. It was used as an experimental machine. I cut some few nails to show its workings.

Recess for dinner until 2, P. M.

January 12, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued.

Cross-Q. 724. How many nail machines with your feeders, did you build in all?

A. One nail machine, and three or four feeders, each one made a little differently.

Cross-Q. 725. After you had the settlement, which you have referred to, with Mr. Eberly, did you do any further work on the nail machine under your agreement; and, if so, will you state the amount, or ascertain it, if you are unable to state it at the present moment?

A. I did not after the last settlement, to the best of my recollection.

Cross-Q. 726. Did you, during the time when you were working on the nail machine, do any work for Mr. Eberly, which did not come within the contract. If so, what amount?

A. I did; but the amount I could hardly state; some years more and some years less amounts.

Cross-Q. 727. Can you ascertain the amounts?

A. I may, perhaps.

Cross-Q. 728. Will you ascertain as far as possible, what was the amount of your account against Mr. Eberly under the nail feeding arrangement, and also your account against him, during the same period, for other work which you did for him; and as I infer from the answers you have just given, that you have had more than one settlement with Mr. Eberly, will you ascertain the amount of his charges against you, in all the settlements you have made, and in all the accounts he has rendered you, since you made the arrangement with respect to the nail feeder?

A. I will try.

Cross-Q. 729. Mr. Eberly was known to be a man possessed of considerable property, was he not, during the time since you made the arrangement with him?

A. He was, in the former part of our arrangements. He was considered, then, pretty wealthy.

Cross-Q. 730. What amount did you receive for your labor on the faucets, before the patents were sold to the Drawbaugh Company?

A. I could hardly state. I don't remember. I could perhaps by looking at some memorandum, or by calling on Mr. A. H. Gardner or Mr. Croll.

Cross-Q. 731. Will you please do so, and let me know the amount?

A. I will, but I shall have to ask for time. I should have a day to see these different parties.

Cross-Q. 732. What other parties did you do work for during the two years preceding the formation of the Drawbaugh Company?

A. I could hardly mention. I did work for the general neighborhood there. I could mention some. I did work for Samuel Hertzler, Daniel Hart, George B. Heck, William R Gorgas, John Free, Jackson Free, and by reflection, I could mention a good many others, but I couldn't now.

Cross-.Q 733. Could you give me some estimate of the amount of work you did for other parties, outside of what you did on the faucet and the nail feeding machine during those two years?

A. No. I could hardly give the amount. I could if I had the account book that is lost. I may be able to give some from memoranda that I have. I will try.

[*Counsel requests him to do so.*]

Cross-Q. 734. What period of time is covered by that account book which you say is lost, and how long has it been lost?

A. The period of time is about from 1861 to 1876. I think it was in 1876 it was lost, about the time I moved to Mechanicsburg. I won't be positive that it was 1861. It was about that time.

Cross-Q. 735. When the Pump Company, in the spring of 1867, moved into the shop which you now occupy, you moved your machinery and tools into the shop, and used them there afterwards. Did you not?

A. Yes, sir.

Cross-Q. 736. Can you state generally what those machines and tools were?

A. There were two bench-vises; tools of a hand-lathe; general tools for a drill press or drilling machine, and general wood-working tools composed of saws, chisels, drawing knives, hatchets, several hammers; that is, tools generally used for wood-working, pattern-making, &c.

Cross Q. 737. Had pattern-making been a part of your business, prior to that time?

A. Yes, sir.

Cross-Q. 738. For whom had you been accustomed to make patterns?

A. I made some patterns for Mr. Eberly, for some repairs in his flouring mill. I made some patterns for Lee & Eberly. I made some patterns for Lee & Eberly again—Frank Lee and Eberly were running a brick machine here in the city. I also made some patterns for Abraham Miller, who was running a foundry at Newville. I can't remember all the different parties I made patterns for.

Cross-Q. 739. When the Pump Company commenced business, I suppose it procured additional machinery and tools for carrying on business; if so, will you state, as near as you can, what the equipment of the shop was, and what amount of money was expended for its equipment?

A. I could hardly do that; you could get it more accurately from the Company's books; the equipment is stated in them, I think.

Cross-Q. 740. Can you give the dimensions of that building?

A. I would suppose it to be about forty feet in length; thirty or thirty-five feet in width; two stories and a basement or cellar, and garret or loft.

Cross-Q. 741. Were the basement and the lower floor divided into two or more rooms, or did they each constitute one room?

A. The basement was in one room; the first floor was in two rooms at an early period; I can't state the time; that is, the north-west corner had a small room partitioned off before the Faucet Company, and this remained a short time after the Pump Company occupied the building.

Cross-Q. 742. Will you describe the second story, and state what room or partitions there were in it, at the time when the Pump Company moved in?

A. I think that the second story had some partitions, but I don't remember how they were arranged; I won't be too positive. It had been occupied as a match factory prior to the Pump Company. I have been in pretty often, but I don't remember how it was arranged.

Cross-Q. 743. Did the Pump Company make any change in that

LEPHONE COMPANY,-2

floor; if so, when, and what was the arrangement of the floor, after the change?

A. Yes, sir; they made some change; they moved the small room —brought it up, or the partition from down stairs—and made a small room in the north-east corner of the second floor. The time I do not remember, but it may have been the first six months that the Pump Company were there; I won't be too positive as to the time. With the exception of that small room, the second floor was one room.

Cross-Q. 744. If any change was afterwards made in that floor, state when the change was made, and what it was?

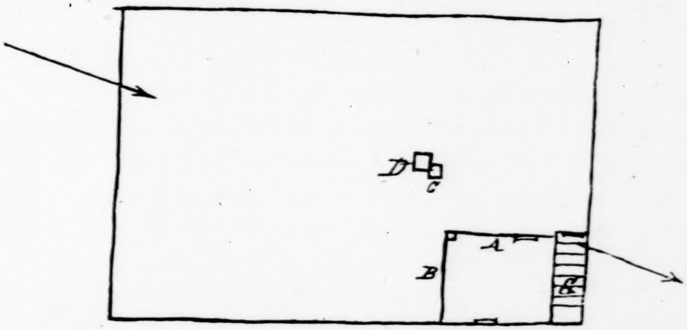
A. There was a change made; it may have been shortly after the first change was made. Another small room was made with partitions, and was used as a wood-working department. I can't give any date, but it occurs to me it was shortly after the first change was made.

Cross-Q. 745. Was this second change made by running the partition across from one side to the other, or in what way was the change made?

A. It run across about as far into the room as the office did, and, if I remember rightly, from a post that was near a chimney, run out to the door. The one partition ran from the post to the west side of the the shop, then from the post to the north end of the shop.

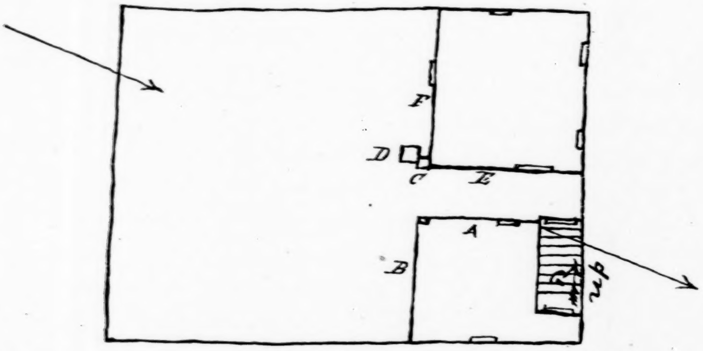
Cross Q. 746. Will you make some diagrams showing the arrangements of the rooms on this floor before this last change was made, and also after the change was made?

[*Witness produces diagram marked "Shop diagram, No. 1."*]



A. That represents the second story after the partitions were moved up from the floor below to make the small room in the north-east corner.

[*Witness produces another diagram marked* "*Shop diagram, No.* 2."]



That represents, to the best of my recollection, the room after the change referred to in my last answer. A and B, on each of the diagrams, represent the partitions of the small room adjoining the staircase G, in the north-east corner on the second floor; C represents a post; D represents a chimney; G represents the stair-case which comes up from the first to the second floor; F and D on diagram No. 2, represent the partitions of the additional room built for a wood-working room. The doors and windows of these rooms are indicated by double lines on the walls of the rooms.

Cross-Q. 747. Is the little room by the stair-case the one you referred to in a previous answer as the office?

A. Yes, sir; that is the one I referred to; it was an office or private room.

Cross-Q. 748. Was a change again made on that floor, after the one shown by diagram No. 2; if so, will you make a diagram showing the room after said change was made?

A. There were a number of changes and so it would be hard for me to describe them; I think the next change was one made by myself, by moving the partition F in towards the north, making the wood-working room somewhat smaller; but the time I couldn't give accurately.

Cross-Q. 749. Was this change, last referred to, made while the Pump Company carried on business there?

A. It was during the time that they occupied the shop, but it was while they had suspended work; I was there alone. They gave me the privilege of staying there and doing work for myself.

Cross-Q. 750. Was it before the Haucks went there?

A. Yes, sir.

Cross-Q. 751. Were any other changes made in the rooms on that floor, before the Haucks went there; if so, what was the next change?

A. I couldn't say positively that there was: I can't remember; it occurs to me that there were changes, but I can't remember what they were. There was a time, and it occurs to me that it was before the Haucks came there—I think the private room by the stair-case was made smaller by moving the partition B.

Cross-Q. 752. Were any changes made at the time the Haucks moved there, or soon after, on this floor?

A. I don't remember that there were changes made at the time they came there, or soon after. There were changes made at the time the Axle Company took charge of the shop, on that floor.

Cross-Q. 753. What were those changes?

A. There was a stairs placed on the outside of the building, brought up from ground to the second floor, at the north end of the building, and a door-way cut through the outer wall into the second floor, entering a gangway between the two rooms; partition F was moved further south.

Cross-Q. 754. How long did that place remain as it was after these last changes; and what, if anything, was next done to it?

A. It remained so until the Clock Company had taken charge of the shop, in the spring or summer of 1878. There was a change in the partition F again; it was brought in towards the north again, I think; then a partition ran from the chimney or post to the south end of the shop. This partition was a prolongation of partition E. I am positive about the long partition, but not about partition F.

Cross-Q. 755. Has any change been made since the long partition was put up; if so, what and where?

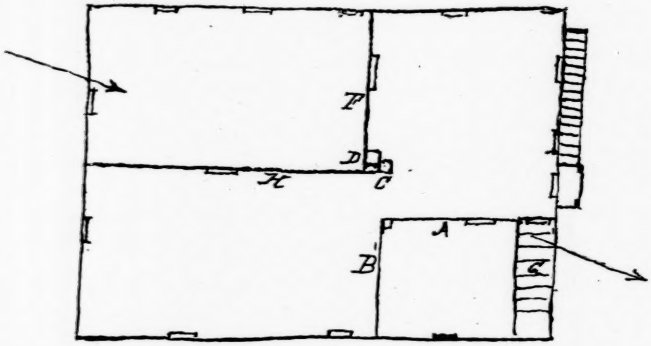
A. There was a change; this small private room, in the north-east corner by the stair-case, was removed. The time I can't exactly give; it was the time that Mr. Chellis first took charge of the shop. I forgot to say that at the time changes were made while the Clock Company were in charge of the shop, partition E was removed, so that I was mistaken in saying that the long partition was a prolongation of partition E.

Cross-Q. 756. Have any further changes been made, since Mr. Chellis took charge there?

A. When this room by the stair-case was moved, partition F, was extended all the way across the shop to the east side.

Cross-Q. 757. Will you make a diagram of the second story, as it was after the changes made while the Clock Company were there?

[*Witness produces diagram marked "Shop diagram No.* 3."]



Adjourned until January 13, 1882, at ten olock, A. M.

January 13, 1882, ten *o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith, continued:

Cross-Q. 758. What machines, or machinery was there in the basement while the Pump or Drawbaugh Manufacturing Company occupied the building, and for what was it used?

A. There was a nail machine, as I stated before, put there for experimental purposes; and a grind stone, for grinding stave knives—that is what it was used for.

Cross-Q. 759. Wasn't there a cider mill there; if so, whose was it and how much was it used?

A. Yes, sir; there was a cider mill there; it was mine. It was used one season, I think; it might have been two, but there was only one season that I did much, or any, business with it. It was afterwards sold to Mr. Elias Hake. I couldn't state what year it was, that I did the business with it, unless I would inform myself. I sold it in the summer or fall of 1875.

Cross-Q. 760. What machinery was there on the first floor, and what work was done there by the Pump or Drawbaugh Manufacturing Company?

A. I will try and give that to you to the best of my recollection. There were five engine lathes, I think; two small, or hand lathes; a machine for drilling faucets, as it was called; a drill-press; a grind stone; there may have been some other small machinery that I can't think of now.

Cross-Q. 761. This shop had a water wheel for driving the machinery; did it not?

A. Yes, sir.

Cross-Q. 762. Will you state what machinery there was on the second floor, and for what the several rooms were used, while the Drawbaugh Manufacturing Company occupied the building?

A. I will state as near as I can remember. There was a wood-turning lathe; that was in the wood working room. There was a machine for making strainers for faucets; that was in a room in the southerly part of the shop, not in either of the small rooms. There was a small grindstone also, I think, in the same large open part of that story, where the strainer machine was. There was a small machine for cutting out the bottoms of strainers; that is all that I can remember of.

Cross-Q. 763. What was the attic used for?

A. For storing away some lumber, patterns, and general sundries that collected in the business.

Cross-Q. 764. Did you make an affidavit in the summer or fall of 1880, with reference to your inventions in telephones, to be used on the motion for the preliminary injunction?

A. I made an affidavit, but I don't remember the time of the year; it was in 1880.

Cross-Q. 765. Did you make more than one affidavit that year, in relation to these matters?

A. I don't know; if I did, I have forgotten it. To the best of my recollection, I did not.

Cross-Q. 766. You had very full consultations, that summer, with the defendants, or their counsel, with repect to what you had done; had you not?

A. I don't know whether you would call it full or not; we consulted together.

Cross-Q. 767. Did you give them a full account of all you had done with reference to telephones—a complete history?

A. I did, I suppose, as far as I could remember.

Cross-Q. 768. You went around with some of the counsel, during that summer or fall and the following winter, to procure affidavits from other parties; did you not?

A. Yes, sir; I did.

Cross-Q. 769. How much time did you spend in travelling about with counsel on that business?

A. I don't know; I couldn't give that accurately; there were some weeks that we were out nearly every day, and there were times when we wouldn't be out for a number of days, perhaps a week, to the best of my recollection.

Cross-Q. 770. As that was not a great while ago, I wish you would give me the best judgment you can, from your recollection, as to the amount of time you spent in that way?

A. I didn't keep any memorandum; I will have to give it to the best of my recollection; all the time summed up may have been three months, or it may have been six months.

Cross-Q. 771. How many affidavits did you obtain?

A. That I couldn't say—how many; we did not get affidavits from all the parties we called on.

Cross-Q. 772. Give me the best judgment you can, as to the number of affidavits you obtained?

A. There may have been fifteen, or there may have been double that number.

Cross-Q. 773. Did you know anything about the preparation of the Defendants' answer, which was filed in the case in January, 1881?

A. I did not—no; if I did, I did not understand its meaning; I didn't know what it was for; I don't recollect of knowing anything about it.

Cross-Q. 774. You have no recollection of being consulted about its preparation, have you, or of seeing it before it was filed?

A. I do not.

Cross-Q. 775. Will you look at a printed copy of the answer, which I now hand you, and especially at the tenth, eleventh, twelfth, thirteenth, fourteenth, fifteenth, and sixteenth sections, and after reading these sections carefully, tell me whether the statements therein contained, so far as they relate to yourself and your history, are in accordance with the information which you had given the Defendants or their counsel, and were justified by what you had told them?

[*After reading, as requested, witness answers.*]

A. Yes, sir; to the best of my recollection, that is in accordance with the statements, or history of the invention, that I had made.

Cross-Q. 776. I call your attention to a statement in the eleventh section, in these words: "That said Drawbaugh, for more than ten years prior to the year 1880, was miserably poor, in debt, with a large and helpless family dependent upon his daily labor for support, and was from such cause alone, utterly unable to patent his said invention, or caveat it, or manufacture and introduce it upon the market." You understand this to be a statement, do you not, that, before 1870, the cause, and the only cause, why you did not patent or caveat your invention, was your extreme poverty?

[*Objected to by Mr. Hill, as putting an incorrect construction upon said statement quoted from the answer.*]

A. I can't say it was extreme poverty, but I felt myself unable, because I made applications to other parties to take an interest. At that early day I knew that it was necessary to experiment, for the purpose of making the machines as perfect as possible, and I know that I had no ready cash, or money, to secure patents; for that reason I asked others to take an interest in it.

Cross-Q. 777. Do you mean to have it understood, from your last answer, that there was any other reason, for some period prior to 1870, except your poverty, whether greater or less, which prevented you from patenting your invention or filing a caveat for it?

A. If I understand that right, there was no other reason that I can think of now.

Cross-Q. 778. For how long a period before 1870 had that been your only reason for not patenting the invention or filing a caveat?

A. I can hardly say how long. My first instruments—I guess one reason with my first instruments was, that they were not perfect enough; but what period, I can't state.

Cross-Q. 779. Which were the instruments which were not perfect enough, and when did you first make instruments perfect enough, so that your only reason for not patenting them or filing a caveat was your poverty?

A. As near as I can remember now, the cup instrument wasn't in a form perfect enough, I thought. The date of time when I thought the machine perfect enough, I couldn't give. I couldn't give the exact date when I thought I did have them perfect enough. The tumbler instrument,—that is, the principle of the tumbler instrument, was perfect enough to make application for a patent, as near as I remember now. Instrument "B" I thought perfect enough.

Cross-Q. 780. Now, will you state for how long a period before 1870 the tumbler instrument and instrument "B" were in a shape which you thought perfect enough to patent?

A. I could hardly state that. I don't remember how long.

Cross-Q. 781. How near the time when the Pump Company moved into the shop, which you now occupy, was it when these instruments were in a condition to patent, as you thought?

A. It would be hard for me to state that. It may have been 1868 or 1869. I won't be positive about the dates, as I don't remember dates.

Crose-Q. 782. The 175th interrogatory refers, if I understand it, to instrument "C," and to the time when Mr. Sadler's wagon was painted, and is in these words: "To the best of your recollection, how long had it been made at that time?" and you answer, "I couldn't be positive as to the length of time. It may have been three, six, or nine months before, or perhaps a year. I don't remember." Referring to Mr. George W. Drawbaugh's testimony, (pages 623 and 624, [597 and 598,]) as to the time when he did the work for Mr. Sadler on the wagon, I understand him to say that he began it immediately after he purchased the lumber from Mr. John F. Lee; and referring to Mr. Lee's deposition, (page 633, [606,]) I find that his charges for lumber were January 11, 1870, March 22, 1870, and May 2, 1870. From these statements, in regard to the purchase of lumber, and the painting of the wagon, and from your statement with regard to the time before the painting of the wagon, at which the machine was made, I should infer that instrument "C" was made as early, at least, as 1869, probably by the middle of 1869, if not earlier. Do you think that would be a fair conclusion as to the time when instrument "C" was made?

[*Objected to by Mr. Hill, as memory, and not fair conclusions, is evidence.*]

A. I don't know. I don't remember the dates, you know. I am inferior in memory of dates. I paid no attention. It may have been. I can't say. I don't know whether it would be a fair conclusion or not.

Cross-Q. 783. Do you think that instrument "C" was made during the year 1869?

A. I couldn't positively say. It might have been.

Cross-Q. 784. Are you willing to say that it was not made as early as the first of 1869?

A. I am guided by the making of that wagon, and the trying of a certain experiment, and I know it was made before that. I couldn't state whether it was three months, six months, or whatever. I made that statement to the best of my recollection. If it had not been for the painting of that wagon, I would not have known whether it was made in 1871 or 1872. I was guided by the painting of that wagon.

Cross-Q. 785. Will you please answer my last question?

[*Objected to by Mr. Hill, as already fully answered, the witness having just testified to the entire exhaustion of his memory on the subject.*]

A. It may have been made as early as the first of 1869. I can't say.

Cross-Q. 786. The 177th interrogatory, referring to exhibits "B" and "F," is in these words: "To the best of your recollection, how long had you used them before you made instrument "C?" and you answer, "I couldn't positively say how long. It may have been several years—two or three years. It might, perhaps, have been more." Are you willing to say that you had not used "B" and "F" as far back as the time when the Pump Company moved into the shop where you now are, which would be only three years from the spring of 1870, when Sadler's wagon was painted, I suppose?

A. To go by my own recollection, I could'nt say that it was. George Drawbaugh says that the wagon was painted in 1870, but I hadn't remembered that date, but I know the instrument was used after the Company occupied the shop, but any particular date I can't give.

Cross-Q. 787. My question was, whether you were willing to say that those instruments, "B" and "F," were not used as early as the time when the Pump Company moved into the shop. Are you, or are you not, willing to say that they were not used as far back as that time?

A. I am willing, I think, to make fair statements. I don't remember when they were used. They may have been as early as that.

Recess for dinner until 2, P. M.

January 13, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued.

Cross-Q. 788. In the 622 interrogatory you were asked, "Why did you never draw specifications to be filed in the Patent Office, on your own inventions? ' And you answered, "I didn't think I was competent for drawing good specifications. That is as near as I can state it."

In that connection I wish to call your attention to a statement which your brother, Henry F. Drawbaugh, made, in a deposition which he gave in your behalf, in an interference with David A. Hauck and yourself. I read from page 30 of the testimony on your behalf. The answer to interrogatory ten: "He said," ("He" referring to yourself,) "Harry, it don't suit me, with my big family, to have my parents with me. You had father and mother with you until mother died, and cared for them at your own expense, and you keep father as long as he lives, as it suits you better than me, and we will take out this patent-right on this faucet and you furnish the money. I will make out the specifications, drawings, and models, and give you an interest in it, as an equivalent for taking care of our parents."

When you made this statement to your brother about making out the specifications, drawings, and models, did you mean to have him understand that you thought you were not competent to make specifications?

A. I don't know what I wanted him to understand at that time, but I always considered myself not competent to make good specifications and drawings. I was in the habit in a number of inventions of my own, to make drawings and preliminary specifications, to be corrected by the agent who would take out my patent.

Cross-Q. 789. In the same interference, when you were testifying, your counsel, Mr. Jacobs, who is also one of the counsel for the Defendants in this case, asked you (on page 37, question 95) to point out the difference between two things to which he referred, and the counsel for the opposite party objected that you were not "an expert in the examination of mechanical devices or appliances, nor mechanical drawings, and is, therefore, incompetent to testify to the facts solicited by the question;" whereupon Mr. Jacobs proceeded, as I understand, to show by your own testimony, that you were competent, and he put this interrogatory: "Mr. Drawbaugh, what was the first machine that you ever made?"

Do you remember what answer you made to that?

A. I don't remember exactly what answer I made to that. The reason of this is—I don't know whether the question had reference to some small devices I made when a small boy or not.

Cross-Q. 790. I will read your answer, and you may then state whether it was a correct one or not?

"Answer. I made part of a clock when I was about ten or twelve years old, and the next that I can remember of any consequence, was a small steam engine when I was between fifteen and seventeen years old. About that time I made an automatic machine for sawing wagon felloes. That was my own invention."

A. Yes, sir.

Cross-Q. 791. Mr. Jacobs then asked you, "Have you made many or few machines since that time?" And you answered, "I have made many." He then asked, "How many have you invented?" Do you remember what your answer was to that?

A. I don't remember how it was then, but I could state. It may not be just in rotation, as it would be there. I don't know that I could think of all the machines that I did invent. I will mention some. A stave-jointing machine; a stave, head, and shingle-cutting machine; a machine for dressing and rounding off barrel heading; machines for dressing and levelling mill-burrs; a machine or invention for balancing and running mill stones, termed improved mill-burr irons or ryne and driver; several improvements on measuring faucets; several improvements on a nail plate feeding device; and a great number of others that I couldn't just mention; there were a great many improvements and inventions that I didn't have patents for, and can't now remember. In that answer I may not have had as many, or I may have mentioned more. I may have mentioned in that statement, an improved machine for making carpet-tacks; and I might have mentioned a device for sewing carpet-rags; and I don't know whether I mentioned anywhere a number of improvements about the shop, in the way of machines for making different parts of the faucet. I do not know whether I mentioned that in there. There was quite a number of inventions in that.

Cross-Q. 792. The answer which you did give to Mr. Jacobs, was this: "Answer. I couldn't state how many; I might say fifty." That was a correct answer, I suppose?

A. Yes, sir; I will say that again."

Cross-Q. 793. Mr. Jacobs then asked you, "How many have you had patented?" And you answered, "Over a dozen." That was correct, I suppose?

A. Yes, sir.

Cross-Q. 794. He then asked you this question; "Have you applied for and procured in person patents for any of them, or have you not?" And do you remember what answer you gave to that question?

A. I don't know exactly what answer I made; I may have said that I made drawings and drew specifications.

Cross-Q. 795. The answer you did give was this: "Answer. Yes, sir; I mean I made my own specifications, models, and drawings, and drew my claims." That was correct, I suppose?

A. Yes, sir; that was correct; but they were afterwards revised, re-written.

Cross-Q. 796. Did you make any explanation at that time, that they were afterwards to be revised, and that they were not good specifications, drawings, and claims when they left your hands?

[*Objected to by Mr. Hill, as immaterial, unless it be shown that such explanations were called for by the counsel examining or cross-examining the witness, or that the attention of the witness was called to such matter.*

Counsel for Complainant suggests that the counsel who proposed the question could not at that time have been expected to call for any explanations tending to show that the witness was not qualified as an expert, and that it was the duty of the witness to state correctly the character of the work he had been accustomed to do.

Defendants' counsel insists upon his objection, that it should be shown that in the taking of the alleged deposition, the witness' mind was called to the matter now inquired of; and counsel, while declining to argue here the question as to the duty of the witness, fails to see why the answer was not a correct answer to the question as propounded.]

A. No, sir; I didn't think it necessary.

Cross-Q. 797. Mr. Jacobs then asked you, "Have you, or have you not, done the same for other inventors?" And you answered, "Yes, sir; I have." That was correct, I suppose?

A. Yes, sir; it was; I stated that here before, in my direct testimony.

Cross-Q. 798. A little further on, Mr. Jacobs asked you this question, "Have you, or have you not, read and studied much upon the subject of mechanics, and upon kindred subjects?" And your answer was, "I read a good deal; more particularly upon mechanical subjects." That was correct, I suppose?

A. Yes, sir.

Cross-Q. 799. In cross-examination, the opposing counsel asked you this question, on page 72, "Cross-Question 180. You stated that you have made your own specifications, drawings, and models, and also have done so for others; have you not uniformly had an attorney of record, in all your cases, in addition to yourself, who has supervised and corrected your specifications and claims?" And your answer was as follows:

"Ans. All my cases through the office were gotten by attorneys; but some of them were dictated and drawn up by me; though I have taken out a number of patents for other parties, I prepared their papers and drawings, but they made their own applications. It was then not necessary to have a power of attorney from the parties; there was no attorney of record in these cases." That answer was correct, I suppose?

A. Yes, sir; that answer was correct; but I might state, that in some of those cases, there were other drawings made, and changes in the specifications. So the party told me, that I drew these specifications for. I might not have thought it necessary, at that time, to make that statement.

Cross-Q. 800. What were your duties when you were first employed by the Pump Company, or "Drawbaugh Manufacturing Company?"

A. I don't know that I had any particular style; I was there to see after the mechanical part of the shop, and worked as one of the hands; and I was paid by the day.

Cross-Q. 801. At what rate per day were you to be paid, according to the agreement as originally made?

A. I think it was two dollars a day, if I remember right.

Cross-Q. 802. Did you work both upon the wood work and the iron work of the Company?

A. Yes, sir; I worked both at the iron work and the wood work—whatever was most necessary to be done.

Cross-Q. 803. Did you prepare any of the plans or working drawings of any machinery that the Company was constructing for its own use or for other people?

A. Yes, sir.

Cross-Q. 804. State generally for what machines, distinguishing between those for the Company, and those for other parties?

A. For the Company I devised a machine, and made drawings for a machine, for facing and turning lids for faucets; another machine for turning the pistons for faucets; a machine for drilling the faucets; a machine for making strainers for faucets; a cutting machine, for cutting the bottoms for strainers. There may be some others, that I do not now remember. I remember of making a drawing, and devising a machine for a Company termed the Mill Bush Company. There were a number of machines connected with that. There was a machine that they termed a roller machine. Another machine was called a slotting machine. Another machine called a punching machine, for punching out round rings or gaskets from raw hide; another machine for boring mill bushes. That is all that I can remember now.

Cross-Q. 805. Did you give all your time to the service of the Company, during the first year of its operations, and during the succeeding years, to the spring of 1870; and if not, what proportion of your time did you give the Company?

A. I didn't give them all my time; but the portion of my time I could hardly state. The first six months or a year I may have given them nearly all my time; the years afterwards, up to 1871 perhaps, I may have given them three-fourths of my time, more or less; I can't exactly state how much.

Cross-Q. 806. For what other parties did you do work during those three years?

A. I might mention some, but I can't hardly state the period. It may be within them three years; I done work for Mr. Eberly; also for Lee and Eberly. I think the work for Lee and Eberly was within them three years. I done some work for William Morris. I think he lived at Bridgeport at the time I did the work. There may have been some others that I can't remember now.

Cross-Q. 807. You mentioned that the Company gave you the privilege of staying there and doing work for yourself. Did that privilege extend to the use of the Company's machinery, tools and power, and did it extend during the whole time that the Company occupied the shop, when you were not in the employment of the Company?

A. Yes, sir; that was, though, for an equivalent; they had been using some of my tools, and I think it was considered that that was an equivalent.

Cross-Q. 808. You have spoken of the Mill Bush Company; what was the business of that Company; where was its business carried on, and who were the parties interested in it?

A. They were located at Shiremanstown. Their bushes were made by the Pump Company. There were four or five individuals in the Company, but I don't know whether I could remember their names now; some of them I might. Daniel Rupp, I think, was manager. William Sadler was one, John F. Teahl, and one or two others whom I can't now mention.

Adjourned until Tuesday, January 17, 1882, at 2 o'clock, P. M.

Tuesday, January 17, 1882, 2, P. M.

Adjourned until Wednesday, January 18, at ten A. M.

January 18, 1882, ten, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 809. In your answer which I read from the record in the interference case, relating to your reading, you said you had read a good deal, more particularly on mechanical subjects. What books or publications had you been in the habit of reading upon mechanical subjects?

A. I was a subscriber to the *Scientific American* at an early period. The date I can't give you when I commenced taking it, or when I stopped taking it. I have in my possession a few works on mechanical subjects. I don't know whether I can give their titles. One of them was a mechanical encyclopedia, published in New York about the time of the first fair in New York; somewhere about 1852. I don't remember the exact date. I will refer to it and give you its title and date of publication tomorrow morning.

I borrowed a book from William R. Gorgas. It was an encyclopedia published about thirty years ago. I think it was an English book. It was in quite a number of volumes. I don't remember how many. That I had in my possession a long time, and read. I don't remember what the other books were. I only read some numbers of the last encyclopedia referred to. I did not read the whole work.

Cross-Q. 810. Did your reading extend to the subject of chemistry in any of its branches, or to any of the arts in which chemistry is an important part.

A. I don't remember. I read the book just as a general thing, for information on different subjects. I don't remember what particular subjects. When I read the *Scientific American* I generally read all articles that were of interest. I didn't pay particular attention—that answer will apply to all my reading. There is one subject that I remember I paid particular attention to, and that was on light—on photographing. In the work I got from Mr. Gorgas, I remember of reading articles on acoustics. That is all the subjects I remember of reading.

Cross-Q. 811. What Mr. Gorgas was that, and is he now living?

A. William R. Gorgas. He is now living in Harrisburg, here. He lived at that time in the neighborhood of Eberly's Mills,—about half a mile north-west. It is about three or four years, I suppose, since he moved to Harrisburg.

Cross-Q. 812. What did you do with reference to the subject of photography?

A. I fit up a small room and experimented a little in that direction. I made a camera myself, and purchased a few necessary chemicals, and experimented that way at spare times that I had.

Cross-Q. 813. How long ago was that?

A. My first camera that I made,—a temporary arrangement, was a few years after I was married. I married in 1854. I might say it was in 1857 that I first tried experiments, and to the best of my recollection—with those experiments—before the close of the war. I can't give you the exact period.

Cross-Q. 814. Did you make the lenses for your cameras?

A. I did not in the first camera. I did—I made lenses, I may say, a year or two after that.

Cross-Q. 815. Before you moved into the shop you now occupy, in the spring of 1867, what had you read or known on the subject of telegraphy, and in relation to the practical operations of telegraphing, as then practiced in the country?

A. I read a work on that, though I can't give you the title. I still have the book. I think it was called "The Practical Telegrapher," but I won't be positive. I will bring the copy of it over in the morning, and you can look at it and see the title.

Cross-Q. 816. In your answer to the 406th direct interrogatory, you said, referring to the speaking telephone invention, "Yes, sir: I intended to patent it. I had spoken to a number of persons to assist me. I would state to them that I would give them an interest in the invention, for them to furnish the money to have it patented," and in answer to the 408th and 409th interrogatories, you mentioned Christian Eberly and Frank Lee, as among the earliest persons to whom you spoke upon the subject. Will you give me the names of the other persons to whom you spoke upon the subject, and, as nearly as you can, the times at which you spoke to them?

A. I couldn't recall all. I spoke to a great many, but I can give you a few. I spoke to Captain Moore on the subject. That period was about 1875, to the best of my recollection. I also spoke to Henry Bayler, but that period I can't hardly get at. It might have been as early as 1872 or as late as 1874. I couldn't get at it accurately. I also spoke to Simon Oyster, and I think that was before I spoke to Bayler, to the best of my recollection. That is all that I can now remember.

Cross-Q. 817. In your answer to the 411th interrogatory, you said, among other things, "At the time I showed it to those parties, I was desirous of having it patented, but some of those parties tried it, and seemed to think it was not sufficiently complete; that it ought to be so that it could be placed on a table, and talk out; that seemed to be the idea." Were Moore, Bayler, and Oyster among those who seemed to think it was not sufficiently complete?

A. I don't remember exactly which of the parties. I know that is the impression that I formed; they may not have stated it in those words that I have stated there. I am pretty positive that Mr. Bayler said so, and Mr. Eberly. That is, to the best of my recollection.

Cross-Q. 818. Mr. Eberly, I understand, declined to take an interest in the invention; did Mr. Frank Lee also decline, and if so, for what reason?

A. Mr. Lee didn't go into it; I don't know what reason he had. My impression that I got about Mr. Eberly is, that if it had been some other machine, that he could have seen into the philosophy of it—some agricultural machine, or some simple machine, he would have took a hold of it. That was my impression, but as it was, he didn't.

Cross-Q. 819. Do you remember what Mr. Lee said about the invention, and about going into it?

A. I do not; I don't remember what he said; Mr. Eberly and Mr.

Lee called at the shop a number of times, and I showed them the machine.

Cross-Q. 820. Which machines did you show Mr. Lee?

A. I don't remember which machines. Whatever machines I would have had at the time of the visits, I would have showed them. I may have showed them the tumbler machine "F," and the tin can receiver "B," or the instrument "C," and receiver or instrument "I." I knowed I showed them instruments, but I am not positive which of the instruments. I am positive of showing them instruments at a very early time.

Cross-Q. 821. How long before Mr. Lee's death do you think it was, that you showed him instruments, and talked to him about taking an interest in the invention?

A. I could not positively say how long; it may have been four or five years, or not so long.

Cross-Q. 822. Do you think you stopped showing him the instruments, and stopped talking to him about taking an interest, as long as four or five years before his death?

A. I couldn't say when I stopped; they called on me quite frequently, and I showed them the machines pretty often, but I couldn't say when I showed it to them last, or when I spoke to them last concerning the matter.

Cross-Q. 823. Do you know why you stopped talking to Mr. Lee upon the subject, and exhibiting the instruments to him?

A. I don't know why. He died, and I don't remember exactly when he died. It may have been because he was dead. I don't know why he didn't call on me.

Cross-Q. 824. Mr. Eberly, I believe, thinks his death occurred in 1872; what is your recollection of the time of his death?

A. I don't remember, but I should suppose it to be a little later. By just guessing, I should suppose it to be about 1874, though I don't remember when he died.

Cross-Q. 825. Did you know of his death about the time it occurred?

A. Yes, sir; I had heard about the time it occurred. I think he took sick in Philadelphia, and, if I am not mistaken, he died in Philadelphia; though I may be wrong in that.

Cross-Q. 826. Did you show him your magnetic clock, and ask him to aid you about that?

A. I suppose I showed him my magnetic clock, but I don't remember of asking him to aid me in that, to the best of my recollection now.

Cross-Q. 827. Did you show him that at the times when you showed him the talking-machine?

A. I don't remember that I did. I may have.

Cross-Q. 828. What was the first thing that you did in applying electricity to the running of clocks?

A. At an early time, about the first year that they went to the shop below, where I now am, I took from the house a temporary arrangement; that is, a wooden pendulum rod about two feet and a half long, at the bottom of which was attached a permanent magnet; and an electro-magnet, not attached at that time. I took them down to the shop where I am now at, and placed it on to a shelf; that is, the upper end of the pendulum rod was attached to a shelf that extended out and was about six feet from the floor; at the bottom, below the permanent magnet, I placed the electro-magnet, on a bracket fastened against the wall of the shop. But prior to that time I had used it in the basement story of the house that I lived at then and now; that is, when I used it at the house; I had used it with a small battery. When I took it to the shop I was going to further experiment. I placed earth in a box. I put into that box a copper and a zinc plate; that is, a positive and a negative, and I kept that earth damp. I kept that pendulum moving at times—not all the time—by that arrangement.

At an after period, I put plates into the earth, but the time I can't exactly state. I don't know how long after I had it in the box, I connected it with the earth. Them were my first experiments in the clock.

Cross-Q. 829. At the time of the first experiments with the clock did you have a train of mechanism and a dial connected with the pendulum, to indicate time?

A. No, sir; I did not. I had mechanism, though, at the top of the pendulum to make and break circuit.

Cross Q. 830. The opening and closing of the circuit was effected, I suppose, by the swing of the pendulum?

A. Yes, sir.

Cross-Q. 831. What was the next thing that you did in relation to the magnetic clock?

[*Objected to by Mr. Hill as irrelevant and immaterial, and as new matter not proper in cross-examination.*]

A. I made changes in the electro-magnets. I don't remember all the changes or experiments that I did do. I could state, though, what next or about next. My first electro-magnet was composed of soft iron cores, bent in the form of a horse-shoe, and the wire wound around the cores by hand; the next was an electro-magnet made of a flat piece formed like a permanent magnet, having its poles wrapped with insulated wire. I could indicate it better by making a sketch.

[*Witness draws sketch, which is marked "Clock Diagram No. 1," and says:*]

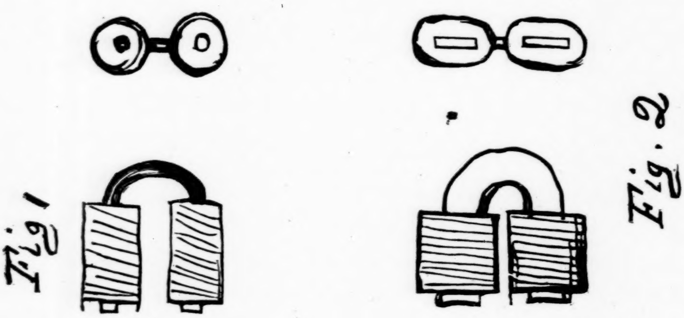


Figure 1 represents my first electro-magnet, above described, and figure 2 the second.

This next magnet I remember distinctly. There may have been some others, but this was the next. It was a flat, steel horse-shoe blade, with its poles wrapped with insulated wire.

Cross-Q. 832. What was the size of these magnets, and what was the size of the wire used in the coils?

[*Same objection by Mr. Hill.*]

A. I don't exactly remember the size of the magnets nor the size of the wire. The first one, I know, was composed of coarser wire than the second; but the guage number of the wire I don't remember.

Cross-Q. 833. What was the next thing you did in relation to this invention.

[*Same objection by Mr. Hill.*]

A. I put a train of gearing in, but that wasn't till a good while after. I don't know whether I could give the period when I did that, that is, I don't remember the time.

Cross-Q. 834. Will you reflect a little and then give your best judgment as to the time when you first put the train of gearing on ?

[*Same objection by Mr. Hill.*]

A. I hardly know ; it may have been three months, six months or a year.

Cross-Q. 835. Three months, six months or a year after what time ?

[*Same objection by Mr. Hill.*]

A. Well, after trying the first experiments.

Cross-Q. 836. Had you made any further experiments with the pendulum alone, beyond what you have stated, before you put the train of wheel-work on ?

[*Same objection by Mr. Hill.*]

A. I don't remember that I did.

Cross-Q. 837. Did you make the train of wheel-work, or did you use one that belonged to some other clock ?

[*Same objection by Mr. Hill.*]

A. I made it. I made it by hand. That is, I have reference to the ratchet wheel. A few of the wheels were out of another clock movement.

Cross-Q. 838. Did you make the frame-work for supporting the train of gearing ; and if so, of what did you make it ?

[*Same objection by Mr. Hill.*]

A. I made the frame work, and, if I am not mistaken, it was just made of a board with pins placed. I think it was just wood, (I could describe that—make a sketch of the manner of the first one that was made,) because it was got up just as a temporary trial. I might, maybe, describe it without a sketch. I will try.

[*Witness asks Complainant's counsel whether he shall give an explanation with all its details, and counsel directs him to give a general description, in order not to consume more time.*]

It was composed, as before stated, of a pendulum and the following parts: Said pendulum moved a rachet wheel by means of a pawl; that rachet wheel had sixty teeth; said wheel had a tubular shaft; on the said tubular shaft was one pin or arm.

A second train, with sixty teeth or notches.

Each revolution of the first rachet wheel, which would make a complete revolution once every minute, would move the second wheel one notch, which would be one revolution in one hour.

The second train also had a tubular shaft; around that was a second tube, which second tube had four pins or arms.

Around the second tube was a third tube, having a wheel which was operated by the pins of the tube, and each fourth of a revolution of the second wheel caused a fourth of a revolution of the third tube.

The second wheel had one hand, which denoted the minute, and the third outside tube carried a hand which denoted the hour. That will be a general description. It was composed of few parts.

Recess for dinner until 2 o'clock, P. M.

WEDNESDAY, *January* 18, 1882, 2 P. M.

Examination resumed, pursuant to adjournment.

[*The witness says that the answer above does not express his idea, and continues:*]

One revolution of the minute hand would cause one twelfth of a revolution of the hour hand, by means of those four arms.

Those wheels were supported by studs fastened into the base. There was no journals; they were kept in place by pins or studs. There was no front frame, only a base. There was no frame particularly. There was a bracket screwed on to the base, which extended over the wheels to keep them in their places on the pins or studs.

Cross-Q. 839. Was this clock provided with a dial and kept running continuously for any length of time, or at different periods? If so, what sort of a dial and how long was the clock kept running?

[*Same objection by Mr. Hill.*]

A. This clock wasn't provided with a dial. It had the parts that I stated before. It was run at times, not continuously. I afterwards made another more complete, and that one was provided with a dial. The length of time between the first one and the one last mentioned I don't remember.

Cross-Q. 840. Did the first one have the same magnet and electro-magnet which you had previously used in connection with the pendulum alone?

[*Same objection by Mr. Hill.*]

A. I think it had the same permanent magnet, and part of the time, I think, it had the same electro-magnet.

Cross-Q. 841. What kind of a battery did you run with it?

[*Same objection by Mr. Hill.*]

A. When I first had it at the house—and I may have used that battery at the shop—I had what is called a sulphate of copper battery—a copper vessel filled with a saturated solution of sulphate of copper, with a zinc cylinder in the solution of copper. That was not a very permanent battery. It would only run the clock perhaps a day. In that way, I discovered that it would take a very light electric power to run a clock. It may only run a half an hour with any strength; then it decreases. I don't remember the exact length of time it would run the clock. It may have been a day or more. By that, I discovered that it would only take a very weak current to run the clock, for, although it would get very weak, it would still run the clock.

This first clock was run with an earth battery, but I may have used another battery with it at particular times.

Cross-Q. 842. Was this first clock, which had the train of gearing, ever set up in your house?

[*Same objection.*]

A. No, sir.

Cross-Q. 843. Did you build the second clock—the one that had a dial?

[*Same objection.*]

A. Yes, sir; I built that.

Cross-Q. 844. Did you keep the first one, after you had built the second one and had it set up in your shop?

[*Same objection.*]

A. It was temporary made. I may have kept some parts. There may be some parts of it yet.

Cross-Q. 845. Were they both set up at the same time in your shop?

[*Same objection.*]

A. No, sir.

Cross-Q. 846. Did you use any portion of the first one in constructing the second. If so, what portions?

[*Same objection.*]

A. I think, to the best of my knowledge, I did—some of the brackets and, perhaps, some of the the gear wheels.

Cross-Q. 847. Did you make the dial for the second clock. If so, how was it made.

[*Same objection.*]

A. Yes, sir; I made the dial. It was made out of Bristol board.

Cross-Q. 848. In what respect did it differ from the first clock, besides having a dial?

[*Same objection.*]

A. It was made on about the same principle, but it was made in a better style. I then again used a wooden pendulum, but got it up in a better form.

Cross-Q. 849. Did you make a new magnet, and electro-magnet for it?

[*Same objection.*]

A. I think afterwards. At first I suppose I used the same magnets.

Cross-Q. 850. Was it provided with a case?

[*Same objection.*]

A. A temporary pine case, part of the time.

Cross-Q. 851. Whereabouts in your shop was it set up, and how much was it run?

[*Same objection.*]

A. It was set up in a small private room by the stair-case. I can't say how long it was run—several years.

Cross-Q. 852. How was it run—by what battery?

[*Same objection.*]

A. As a general thing, by the earth battery.

Cross-Q. 853. What kind of plates, and how large, did you use for the battery, and where were they situated?

[*Same objection.*]

A. Copper and zinc plates were used. At first I had them in a box. At first I used plates ten by thirteen or fifteen inches. At times I used plates in the earth, that were perhaps eighteen or twenty inches square; and at other times I had put in plates that were perhaps two feet or more square. I don't remember whether I used the plates in the box with this clock, but I may have used it. I had the battery at different places on this clock. The first plates, I think, were buried in the ground at the

ELEPHONE COMPANY,-2

east side of the shop. I won't be too positive. I may have had a set of plates in the basement or cellar of the shop, to this clock.

Cross-Q. 854. Did you use more than one set of plates at a time—that is, one zinc and one copper plate?

[*Same objection.*]

A. To the best of my recollection, I did not.

Cross-Q. 855. Was this clock constructed and set to running before the Haucks moved into that shop?

[*Same objection.*]

A. Oh, yes; a good while before.

Cross-Q. 856. State, as nearly as you can, how long before?

[*Same objection.*]

A. It may have been three or four years before. May be a little more. That is, I had reference to the first clock, but I don't know exactly how long after I made the first one I made the second. The second clock may have been made three or four years before the Haucks came there, but I ain't positive.

Cross-Q. 857. How long was the second clock run, before you built another?

[*Same objection.*]

A. I can't hardly say that, but there was a considerable lapse of time between that, and building another; but the length of time I don't remember.

Cross-Q. 858. Was that second clock ever taken out of your shop and carried to any other place?

[*Same objection.*]

A. Perhaps part of them movements was put into another clock, that was afterwards taken out of the shop. I think it was in a period about 1875, that I made some little changes, and made a case—a walnut case, and during the time that I lived at Mechanicsburg, I took it and placed it in Mr. Shapley's jewelry store, but the exact period I couldn't give.

Cross-Q. 859. What were the changes that you made in that second clock, besides putting it into a walnut case?

[*Same objection.*]

A. I made some changes on the pendulum; I think I made a new wooden pendulum, and a pendulum ball, and some changes in the moving parts; I don't remember exactly what the changes were. That is as near as I remember it.

Cross-Q. 860. Was that the only clock of that kind, that you constructed, before it was carried to Mechanicsburg?

[*Same objection.*]

A. I don't remember right whether—but it occurs to me that I had two; I think there was another, but I won't be too positive about that, now.

Cross-Q. 861. Do you think you had two set up and running in your shop, before that second clock was carried to Mechanicsburg?

[*Same objection.*]

A. I think so; I won't be too positive, though. I can't remember right.

Cross-Q. 862. Was the third one, if there was one, constructed like the second one?

[*Same objection.*]

A. You see, the way I look at it, I don't think there was a third one there was always parts of it remaining. It was a modification, but you couldn't call it another clock—not the way I look at it.

Cross-Q. 863. Do you, or do you not think, that before the clock was carried to Mechanicsburg, you had another set up and running in your shop at the same time that the one carried to Mechanicsburg was set up and running in your shop?

[*Same objection.*]

A. I think so, but I ain't too positive. If I am allowed, I can investigate that this evening, but I don't know it now.

Cross-Q. 864. Mr. Jacob E. Shettel, a witness heretofore called by the Defendants, says (page 226) [216] that there was, at the time he was speaking of, one electric clock running there, controlled by a large eight-day clock; do you remember about that arrangement of clocks?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 865. Where did you obtain those two clocks; that is, the eight-day clock, and the clock that was run by it?

[*Same objection.*]

A. The eight-day clock I bought at a public sale, and the other I made myself; that is, the one that was controlled by the eight-day clock, I made myself.

Cross-Q. 866. When and where did you buy the eight-day clock, and what did you pay for it?

[*Same objection.*]

A. The eight-day clock I bought at Martin Zimmerman's sale. I can't tell when, nor what I paid for it; it might have been in 1866, 1867, 1868 or 1869. I can't get at it any nearer than that. I might have paid two or three dollars for it.

Cross-Q. 867. When did you build the clock that was run by it?

[*Same objection.*]

A. I could hardly state accurately that. I don't know. It may have been between 1869 and 1872. That I might ascertain, too.

Cross-Q. 868. Will you please ascertain these facts, as far as you can, and report them in the morning?

A. I will try.

Cross-Q. 869. Will you describe generally the mechanism of this clock, which was run by the eight-day clock, and the case it had, if it had one?

[*Same objection.*]

A. There was a metal frame or base, I think, of iron. I won't be too positive about that, but I think it was iron. On that was secured an electro-magnet.

In front of it was an armature. The armature was secured, I think, to the iron frame by a stud that was fastened into said frame.

The upper end of the armature was loosely fitted on to said stud, and said armature was free to vibrate; around said armature was secured a soft iron frame; said frame fit up closely to the armature, but still allowed it room to vibrate; the armature was of steel and was polarized; that is, it was made as a bar or permanent magnet. The electro-magnet induced magnetism in the soft iron frame, and by that means caused the armature to vibrate; by that means, I could move that armature with a great deal less battery power than I could without the soft iron frame. Towards the lower edge of said armature was attached a pawl; the opposite end of said pawl worked into the teeth of a ratchet wheel.

The balance of the movements were similar to the one I described before.

The case was a round or turned case made of walnut wood.

Cross-Q. 870. Was this mechanism some of your own devising?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 871. Did you build more than one clock of that kind?

[*Same objection.*]

A. No, sir; only that one of that kind.

Cross-Q. 872. Whereabouts in your shop were these two clocks, the eight day clock and the one you have just described, set up and run, and when was it first done?

[*Same objection.*]

A. The eight-day clock was in the small room, in the north-east corner of the shop by the stairs, shown on the diagram on page 921 [947]. The other, that is, the electric clock, was changed to different places. First, I think, it was placed in the same room, and afterwards in the working department.

It may have been at some other parts of the shop. I don't remember all of them in the different places.

I did say before, that the eight-day clock was bought and placed there between 1866 and 1869. I can't tell exactly.

The other, as I stated before, was made between 1869 and 1870, or 1872. I can't remember the date.

Cross-Q. 873. What kind of a battery did you use in connection with these two clocks, and where was it placed?

[*Same objection.*]

A. It was a battery that I made in the form of a Daniell battery—a vessel with a porous cup. It was a very small battery, about four inches high, and about two inches in diameter.

The most of that time, that battery was in the same room that the eight-day clock was. It was standing on the floor, part of the time, right back of the clock.

Cross-Q. 874. How long did you continue to run these two clocks in connection with each other?

[*Same objection.*]

A. I hardly know. Perhaps one, two, or three years—not constantly, you know—sometimes they were not running.

Cross-Q. 875. I suppose the eight-day clock opened and closed an electric circuit, which connected the two clocks with the battery. Is that so?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 876. Was the circuit opened and closed by the pendulum at each vibration made?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 877. What object had you in devising and getting up this last clock which you have described?

[*Same objection.*]

A. My idea was, that you could have a regulating clock and run a number of clocks in a city by this main regulator.

Cross-Q. 878. Did you propose to patent it if it proved successful?

[*Same objection.*]

A. Yes, sir; that was the idea. I wanted a party to take an interest in it—different parties.

Cross-Q. 879. What parties did you apply to to take an interest in this invention, and what proposition did you make to them?

[*Same objection.*]

A. I don't remember what parties. I know I spoke to different parties, but just to name them, I can't. The proposition would be about the same that I made to parties about my other inventions. My general proposition was, to give an undivided one-half interest to a party who would furnish money to take out a patent and run the business. I don't remember what proposition I made about this, but that was the general proposition that I made.

Cross-Q. 880. Did you ever take any steps to obtain a patent on this clock?

[*Same objection.*]

A. No, sir.

Adjourned until January 19, 1882, at ten, A. M.

January 19, 1882, ten A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 881. Have you, since the adjournment, ascertained what changes you made in the clock which had the Bristol board dial, before you carried it to Mechanicsburg, besides putting a walnut case to it?

[*Same objection.*]

A. I haven't been thinking over that since. I don't remember what changes, more than what I stated before.

Cross-Q. 882. Have you ascertained whether or not, before you carried that clock to Mechanicsburg, you had constructed another, aside from the one which was run by the eight-day clock?

[*Same objection.*]

A. Yes, sir; and think the other was made before the one I carried to Mechanicsburg. I think so, but I ain't too positive. I can't remember all these little circumstances.

Cross-Q. 883. You described yesterday, a clock mechanism, which was never provided with a dial, and which we have spoken of as the first clock. You then said that you used portions of that clock in building a second one, and that you did not have both at the same time. This second clock, you said, had a Bristol board dial, and was finally carried to Mechanicsburg. Did you construct another clock of the same kind, before you carried the second clock to Mechanicsburg, making three in all, up to this time?

[*Same objection.*]

A. I stated that parts of the first clock were used on the second, so I couldn't call that a clock. There would be three counting that as a clock. Since thinking over it, I don't remember which one I used the parts of the first clock in,—whether in the one I took to Mechanicsburg, or the one that I made before that.

Cross-Q. 884. Then, if I understand you, you think that before you carried that clock to Mechanicsburg, you had constructed three clocks of that kind, including the one which was never provided with a dial, and parts of which were used in the construction of another. Is that what you mean to say?

[*Same objection.*]

A. Yes, sir; providing you term the first one a clock.

Cross-Q. 885. Now, at the time you carried the clock to Mechanicsburg, had you another one of the same kind which you had constructed, and which was then in existence?

[*Same objection.*]

A. Yes, sir; though not made exactly in every respect like the one I took to Mechanicsburg, but in general principle the same.

Cross-Q. 886. Was this third clock, as we will term it, set up and run in your shop before you carried the clock up to Mechanicsburg, and were the two, at any time before that, set up and running at the same time in your shop?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 887. When did you build this third clock—how long before you carried the clock to Mechanicsburg?

[*Same objection.*]

A. I can't say. I don't remember the date, or nearly the date, even.

Cross-Q. 888. Was it before Haucks moved into the shop?

[*Same objection.*]

A. I think not.

Cross-Q. 889. Was it before the Axle Company moved in?

[*Same objection.*]

A. I think it was during the time they were there. I will state, it was made before I moved to Mechanicsburg. I know that. That is to the best of my recollection.

Cross-Q. 890. You were accustomed to speak of the clock which was run with the eight-day clock, as an electrical clock; were you not?

[*Same objection.*]

A. Yes, sir; I generally termed it that; but both were called that sometimes.

Cross-Q. 891. You were accustomed to speak of the other clocks, which you have mentioned, like that which went to Mechanicsburg, as magnetic clocks; were you not?

[*Same objection.*]

A. Yes, sir; I generally termed it so, but some people called it by the name of electric clock.

Cross-Q. 892. Whereabouts in your shop was the third clock set up and run, while the second clock was running in your shop, and before it was carried to Mechanicsburg?

[*Same objection.*]

A. Those clocks were run at various places in the shop. I don't remember exactly where. I had two clocks of that kind at one time in that wood-working department of the shop, but I don't know at what period that was.

Cross-Q. 893. Did you have two clocks in that wood-working department before you carried the clock to Mechanicsburg?

[*Same objection.*]

A. I don't remember that. I don't remember at what period.

Cross-Q. 894. How long did the clock remain at Mechanicsburg, and, when it was brought away, was it brought back to your shop?

[*Same objection.*]

A. I don't know how long it was at Mechanicsburg. I know it was brought to my shop, and my impression is, that it was brought from Mechanicsburg to my shop; that is to the best of my recollection.

Cross-Q. 895. Was it brought back from Mechanicsburg at the same time that you moved back from there?

[*Same objection.*]

A. I don't remember when it was, though I think it was brought back in 1877.

Cross-Q. 896. When you carried it to Mechanicsburg, did you carry it in the black walnut case, which you say you made for it in 1875?

[*Same objection.*]

A. Yes, sir; it was a black walnut case.

Cross-Q. 897. Will you describe that case—state how large it was, and what were its general features?

[*Same objection.*]

A. I will try, as near as I can remember. The extreme length of the case may have been five feet perhaps, may be more—a little; there were two doors; one a round door covering the dial, and another door below, enclosing the pendulum; there was no glass in the frame of the door, nor in the door below. The case was somewhat ornamented by carvings, but I could not give the nature of the carvings; I am just approximating. I don't know whether I am right, exactly. The width may have been fifteen inches, more or less. I don't remember.

Cross-Q. 898. Did you do the carvings on the case?

[*Same objection.*]

A. Yes, sir; some of it; and I think some was done by George Drawbaugh, but I won't be too sure.

Cross-Q. 899. Did you keep the Bristol board dial on that clock, after you put it in the black walnut case?

[*Same objection.*]

A. I don't remember. There is a Bristol board dial on it yet, I think. I remember that while it was at Mechanicsburg, the dial became broken or bent, and a new dial was put on, but the new dial was of Bristol board. Still, I won't be too positive. I think so, but I won't be too positive.

Cross-Q. 900. While the clock was at Mechanicsburg, where was it kept?

[*Same objection.*]

A. I think I stated that before—at Mr. Shapley's jewelry store.

Cross-Q. 901. Was it set up and run there?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 902. Was the running-gear of that clock made of sheet brass or of brass castings?

[*Same objection.*]

A. If I remember right, part of it was made of sheet brass, and part of it of brass castings.

Cross-Q. 903. Was the running-gear fastened to a wooden base, or metal base or frame?

[*Same objection.*]

A. I think it was a metal base, and the metal base was fastened to the wooden back of the case, I think.

Cross-Q. 904. For what purpose was the clock carried to Mechanicsburg?

[*Same objection.*]

A. If I remember right, I think Mr. Shapley asked me to bring it up. I know at different conversations that I had with him I got an idea that he would like to have an interest in some way, and I was anxious to have some one take an interest. After I took the clock there, we spoke some on the subject; he said that he had two thousand dollars that he would invest in it, and I was very glad to get somebody to invest. He, after that, made a clock or got a case, and had parts of the clock made for him. I made some parts of it for him. He never furnished the two thousand dollars. Some time after that I seen Mr. Shettel, though how long after that I don't remember. I told him about that clock, and that we were negotiating arrangements between Shapley and I, and that I was anxious to make an arrangement. He said he would see his brother-in-laws, and he thought may be he could make arrangements. The names of his brother-in-laws were Theodore Grissinger and Jacob H. Grissinger. He then seen his brother-in-laws, but how long after that, I don't remember exactly.

Cross-Q. 905. Did you make a definite bargain with Mr. Shapley to sell him an interest in the clock; if so, what was the bargain?

[*Same objection.*]

A. I don't know exactly about the definite bargain. He said he would furnish two thousand dollars; and then there was a small instrument of writing that I think I signed, or perhaps both of us signed it, drawn up there, and I don't remember what it was. It was not an article of agreement—just a few lines; but I think it related to giving him the first chance, or something in that way.

Cross-Q. 906. What interest was he to have, and what price was he to pay for it, or what was the talk with respect to those things?

[*Same objection.*]

A. I don't remember of anything except that he said he would go into the business and put two thousand dollars in it. There may be other talk. I suppose I offered him the one-half, as I was in the habit of doing—a half interest in nearly all my other inventions.

Cross-Q. 907. Did Mr. Shapley visit your shop while these negotiations were going on, or at any time, in connection with the clock; and, if so, how often and for what purpose?

[*Same objection.*]

A. He was at my shop several times, but I don't remember that we talked anything about the negotiations. He came down several times and brought part of a clock along,—I have reference to the clock that he partly made. One time I remember he brought his pendulum and filled it at my shop with lead. He may have been there two or three times—I do not remember the number.

Cross-Q. 908. State as nearly as you can when these visits were made.

[*Same objection.*]

A. I couldn't exactly state; it may have been the latter part of 1876 or it may have been the spring or summer of 1877; I ain't positive.

Cross-Q. 909. When you brought your clock away from Mechanicsburg, what did you do with it?

[*Same objection.*]

A. It is in the shop yet; I have got it yet.

Cross-Q. 910. Was it set up in the shop and set to running, and has it been there all the time since?

[*Same objection.*]

A. It has been there all the time since, to the best of my recollection; it has not been all the time running; I don't remember whether it was set to running when first brought back, but I think so.

Cross-Q. 911. Has it now the same black-walnut case which you say you built for it in 1875?

[*Same objection.*]

A. Yes, sir; with the exception that there was a little change; it was finished up—shellaced and varnished, and some little change, I don't remember what, in the carvings.

Cross-Q. 912. Have any other changes been made in that clock, either in the case or in the mechanism?

[*Same objection.*]

A. No; not to the best of my recollection.

Cross-Q. 913. Has it ever had a glass door or glass front, which showed all the works?

[*Same objection.*]

A. Never had no glass door. That is, it never had glass in the door. The center of the dial was cut away to show the interior movements, or part of the movements.

Cross-Q. 914. While this clock was at Mechanicsburg, was the clock, which we have called the third one, set up and running in your shop?

[*Same objection.*]

A. I think so, but I ain't sure. I guess part of the time it had.

Cross-Q. 915. Was the running part of that clock made of sheet brass or brass castings, and did it differ in any respect from the clock which went to Shapley's?

[*Same objection.*]

A. It was part of it made of sheet brass and part of cast brass. I think it did differ, though in what particular I don't remember. The general principle was the same.

Cross-Q. 916. What kind of a dial and case did it have?

[*Same objection.*]

A. One of those two clocks at one time didn't have any dial. There was figures drawn with a pencil on the back or base-board, opposite the hands. Then, at another time, I made a dial out of ordinary drawing paper—just roughly made. It had no more than the base-board part of the time. Then there was a case made. I don't remember how long after that—a walnut case.

Cross-Q. 917. Will you describe this walnut case, and state, as nearly as you can, when it was made?

[*Same objection.*]

A. It was composed of walnut boards. That is, two walnut board sides, a top, a bottom, and an open door-frame, covering the whole case of the clock. There was a few carvings on the top and sides of the case. It may have been made in 1875, 1876, or 1877. That is as near as I can get at it.

Cross-Q. 918. What were the dimensions of this case and of the opening in the door frame?

[*Same objection.*]

A. The opening in the door frame may have been in length three feet and a half, and in width perhaps fourteen inches, as near as I can now state it. The height of the case may have been four feet perhaps—maybe a little more. In width say, fourteen or fifteen inches, as near as I can get at it.

Cross-Q. 919. Was this clock door ever provided with a glass? If so, when and where did you procure it and what did it cost?

[*Same objection.*]

A. There never was a glass put in it. There was a glass procured at the time Shettel and the Grissingers went into the Clock Company—that summer, I think. They bought it, and paid for it, I guess.

Recess for dinner until 2, P. M.

Jan. 19, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued.

Cross-Q. 920. What was done with this third clock after the second clock came back from Mechanicsburg, and where is it now?

[*Same objection.*]

A. I don't know what was done with it. There wasn't anything done. It is at the shop now.

Cross-Q. 921. Did you do anything about building more clocks while the second clock was at Mechanicsburg? If so, what did you do?

[*Same objection.*]

A. Nothing that I remember of.

Cross-Q. 922. Did you build the running-gear of the first clock yourself?

[*Same objection.*]

A. Yes, sir; to the best of my recollection I made the running-gear.

Cross-Q. 923. I wish now to confine your attention to the period after the clock came back from Shapley's and before the time when you made the arrangement with the Grissingers, which, I understand, was in the spring of 1878. Did you construct any clocks during that period, or have any constructed, at your shop?

[*Same objection.*]

A. Yes, sir; I think there was one.

Cross-Q. 924. Will you give a description of that one, and state what was done with it, and where it now is?

[*Same objection.*]

A. The construction of the moving parts was about the same as I have described before, as near as I can remember. The case was a little more handsomely made. It would be hard for me to describe it in every detail. I will endeavor to describe it in its dimensions as nearly as I can. The case may have been about five feet and a half, or maybe six feet in length; the width of it may have been sixteen or eighteen inches, and the depth of the case from front to rear six or eight inches. The dial was made of glass. The figures were gilded. There were two doors, one for the dial and one for the lower part of the case, where the pendulum was placed. The pendulum was a compensating pendulum of steel and brass, but was not what is termed a "grid-iron pendulum." It had a compensating lever in it.

Cross-Q. 925. Was the train of gear mechanism visible through the glass dial?

[*Same objection.*]

A. Partially so; the dial was frosted.

Cross-Q. 926. Was the dial plate round or square? What was the diameter of the circle within which the figures were placed?

[*Same objection.*]

A. The dial plate was round. I couldn't actually give the diameter of the circle in which the figures were placed; the diameter of the dial plate was about twelve or thirteen inches, to the best of my judgment.

Cross-Q. 927. Where did you obtain that dial plate, and what price did you pay for it?

[*Same objection.*]

A. I don't know where I obtained the glass. I cut the dial out of a plate of glass; I prepared it for lettering; I cut a hole in the center for the hour and minute hands, and another hole two or three inches from the center for the second hand. I did that on a lathe. Mr. Isaac Lloyd, of Harrisburg, did the gilding; I don't think it cost me anything—the gilding. I think he presented that—the work to me.

Cross-Q. 928. Was there a glass in the lower door; if so, what were its dimensions?

[*Same objection.*]

A. Yes, sir; there was a glass in the lower door. Its dimensions I don't remember. I will give that to the best of my judgment, if you will allow me. It may have been two feet and a half long, by, perhaps, eight or nine inches wide.

Cross-Q. 929. Where did you procure that glass, and what did it cost you?

[*Same objection.*]

A. I don't know exactly where I got that glass. I think I procured it in Harrisburg. It may have, may be, cost fifty cents, or perhaps less; it was not a plate glass.

Cross-Q. 930. Was any part of the clock mechanism visible through it?

[*Same objection.*]

A. Yes, sir; the pendulum was visible through it.

Cross-Q. 931. Was the train of gearing made out of sheet brass, or from brass castings, and was it carried on a wooden base, or on a metal one?

[*Same objection.*]

A. It was composed of both sheet brass and cast brass; the movement was secured to a metal base.

Cross-Q. 932. Did you make any patterns for castings for any part of this clock; if so, for what parts?

[*Same objection.*]

A. Yes, sir; I made patterns. There was a pattern for the base, patterns for some of the gear wheels, and patterns for the brackets, for the purpose of keeping the wheels to the studs in the base.

Cross-Q. 933. Did you do the work on this clock yourself, including the making of the patterns and the making of the case?

[*Same objection.*]

A. I made the patterns for the brass castings, and I made the movements. George Drawbaugh made the principal part of the case; I made some of the carvings on the case.

Cross-Q. 934. Can you give us any idea how the clock was ornamented by carvings or mouldings?

[*Same objection.*]

A. That would be pretty difficult to answer; I couldn't describe the nature of the carvings. It couldn't be done by words, or I can't do it by words.

Cross-Q. 935. Was it provided with an ornamental top and base?

[*Same objection.*]

A. It was provided with an ornamental top and sides, or edges, of the case, not a particular ornamental base. There was a base made after the Grissingers went into the Company. That base was made to set it on when exhibiting. That clock had been on exhibition.

Cross-Q. 936. For convenience, we will call this clock the fourth clock. Will you state what was done with it after it was completed, and before the Grissingers became interested in it, which, I understand, was April 1, 1878?

[*Same objection.*]

A. I don't know that I can answer that. There wasn't anything done. It was set up in the shop, and run part of the time. It wasn't running all the time.

Cross-Q. 937. Whereabouts in the shop was it set up and run?

[*Same objection.*]

A. Part of the time it was set up in the wood department and run, and in the small private room next to the stairs, and it had been in the large part of the shop, south of the wood department of the shop.

Cross-Q. 938. Was it put on exhibition before the Grissingers came there? I mean, anywhere outside of your shop.

[*Same objection.*]

A. To the best of my recollection, it was not.

Cross-Q. 939. To the best of your recollection, how long was it before the Grissingers came there that it was first set up and run in your shop?

[*Same objection.*]

A. That is hard for me to state. I think the case was made some time in 1877, if I ain't mistaken. The movements may have been made in 1876. The movements were made a considerable time before the case, but I won't be positive about them dates. Dates knocks me, sometimes.

Cross-Q. 940. When, and where, and by whom was this clock first exhibited, outside of your own shop?

[*Same objection.*]

A. I won't be too positive, but I think it was in the spring or first part of the summer of 1878, in this city—Harrisburg—by Mr. Johnson Leonard.

Cross-Q. 941. Did you sell the clock to Mr. Leonard, or make any bargain with him to sell it to him, or did you employ him to exhibit it?

[*Same objection.*]

A. I didn't make a bargain. It was a Company—Shettel, the Grissingers, and myself—had made a bargain, and he had contracted for the clock, but the price of it I don't remember now. He had the control of exhibiting.

Cross-Q. 942. Was there a written contract with Mr. Leonard with reference to the matter?

[*Same objection.*]

A. Not that I remember. I don't remember that there was. There may have been, though I don't remember.

Cross-Q. 943. While that clock was on exhibition here, were there any notice of it in the Harrisburg papers?

[*Same objection.*]

A. I believe there was.

Cross-Q. 944. At what place in Harrisburg was it exhibited, and for how long a time was it on exhibition?

[*Same objection.*]

A. It was in Market street. The number I don't remember—several blocks down the street. I hardly know for how long it was on exhibition; for one, two, or three weeks, perhaps. I don't remember how long.

Cross-Q. 945. Were you present during any part of the time while it was on exhibition?

[*Same objection.*]

A. I was there a few times. I don't remember the number of times. Mr. Leonard invited me to come over several times, I remember; that there were some parties wanted to see me—wanted a description of the clock. He couldn't describe it.

Cross-Q. 946. Do you remember who those parties were?

[*Same objection.*]

A. I remember one party, though I can't give his name. There was a gentleman here from Boston. I came over one day on purpose to see him.

Cross-Q. 947. Where did Mr. Johnson Leonard reside, and how long had you known him at the time the arrangement was made with him?

[*Same objection.*]

A. My impression is, that he resided in Harrisburg. He was sometimes over in my neighborhood. His father-in-law lives over there. I had known him four or five years prior to that time, as near as I can remember.

Cross-Q. 948. Is he any relation to George Leonard, who formerly resided at Eberly's Mills, and who has been called as a witness for Defendants?

[*Same objection.*]

A. Yes, sir; he is a son of Mr. George Leonard.

Cross-Q. 949. Who is his father-in-law?

[*Same objection.*]

A. Henry Stephens.

Cross-Q. 950. Was there a written contract with Johnson Leonard, in relation to the clock?

[*Same objection.*]

A. I don't remember. My impression is that there was not more than a verbal contract. I don't know.

Cross-Q. 951. What was done with this clock after its exhibition in Harrisburg was closed?

[*Same objection.*]

A. Mr. Leonard had taken it to Lancaster—I think Lancaster—and exhibited it at Lancaster.

Cross-Q. 952. What was next done with it?

[*Same objection.*]

A. I should rather say, that before he took it to Lancaster, the arrangement was that he should pay for the clock, and he had promised to pay for it and neglected to do so. He then took it to Lancaster rather in a disguised way, and the parties that composed the Company were dissatisfied, but they allowed him to exhibit it there. After he was through exhibiting there, he sent it to the West, without letting us know, and our impression was, that he was going to run away with the clock, and we sued him for it. He returned the clock. There is one thing I forgot to mention. When he was exhibiting here at Harrisburg, he took in a partner, a Mr. Warner. His given name I don't remember.

Cross-Q. 953. Did Mr. Leonard pay anything on the clock—if so, how much?

[*Same objection.*]

A. I think he did pay a small amount, though I don't remember what that amount was. The Grissingers collected the amount, I think.

Cross-Q. 954. Do you know whether they returned the money when he returned the clock?

[*Same objection.*]

A. I don't know whether they did or not, but I think some part of the money was retained for expenses of shipping, or some other expenses. I think something was said. I don't remember the particulars of it.

Cross-Q. 955. What was done with the clock after Mr. Leonard returned it, and where is it now?

[*Same objection.*]

A. After that there was a party, or I think two parties, who had bought the clock. One was named Willet, I think, and the other, I think, was Mr. Warner, mentioned above. They exhibited it at a few places, or for a while, and then they sold it to a party in Harrisburg. That party I don't remember the name of. If it is necessary, I can ascertain it. The clock is now in New York, I believe, in the care of Mr. Marx.

Cross-Q. 956. After the sale to the party in Harrisburg, whose name you do not remember, did that clock ever come again into your possession, or into the possession of the Company by which it had been sold?

[*Same objection.*]

A. It never came into my possession. Mr. Chellis got possession of it afterwards.

Cross-Q. 957. Besides what was done on this clock after the clock came back from Mr. Shapley's, and before April 1, 1878, when the Grissingers took hold of the business, was there anything else done on clocks at your shop? If so, what was it?

[*Same objection.*]

A. No other.

Cross-Q. 958. After the Grissingers took hold of the business, what was done in relation to building clocks?

[*Same objection.*]

A. There were two clocks made while they were in the business.

Cross-Q. 959. Were there any made after they quit the business?

[*Same objection.*]

A. No, sir.

Cross-Q. 960. Were those two clocks, which were made while the Grissingers were in the business, made at the same time, or was one made after the other?

[*Same objection.*]

A. I think there was a time elapsed between the making of the two clocks, but the time I don't know; that is to the best of my recollection.

Cross-Q. 961. Was the first one built soon after the Grissingers took hold of the business?

[*Same objection.*]

A. I think so; I don't remember the length of time after they went into the business.

Cross-Q. 962. How did the running mechanism of this first clock built by the Grissingers correspond with that of the clock you have been speaking of, which Johnson Leonard exhibited?

[*Same objection.*]

A. The general principle of the movements were the same; the case was more elaborately and expensively made; it was a larger case and a larger dial.

Cross-Q. 963. What work did you do on it personally?

[*Same objection.*]

A. I drew the plan of the clock and made the movements and a part of the carving; George Drawbaugh made the case and done the balance of the carving.

Cross-Q. 964. Will you describe generally this clock case and the dial?

[*Same objection*]

A. Its base was, perhaps, three feet, or over, wide, and perhaps the extreme height of the whole case would be from six and a half to seven feet; the width of the case two feet, about; the diameter of the dial would be, perhaps, about twenty-two inches; that is as near as I would judge of the dimensions of it; the dial was made out of brass sheeting, the face of it silvered and was figured; there were glass doors covering the whole body of the case, except the base, and a margin of the sides of the case.

Cross-Q. 965. What was done with this clock after it was completed, and where is it now? Please give its full history.

[*Same objection.*]

A. Mr. Chellis had bought out the clock interest, and it was afterwards moved to his place; and afterwards it was moved to Mr. Jacobs' office; it is still there yet.

Cross-Q. 966. Was it set up and run in your shop, and if so, in what part of your shop and how long?

[*Same objection.*]

A. Yes, sir; it was set up and run some part of the time it was there; it was placed into what we termed the clock room, at the southeast corner of the building.

Cross-Q. 967. Who did the work on the second clock, which was built by the Grissingers?

[*Same objection.*]

A. George Drawbaugh made the case and I made the movements.

Cross-Q. 968. Was the movement made like the clock preceding it?

[*Same objection.*]

A. Yes, sir; about the same; embracing the same principles.

Cross-Q. 969. Were the castings of the mechanism and the base made from the same patterns in the two Grissinger clocks, and from the same patterns that were used in the Johnson Leonard clock?

[*Same objection.*]

A. I don't remember; I think there was a slight change in the patterns—in some portion of the patterns, but what part I don't remember now.

Cross-Q. 970. Was that change made after the first Grissinger clock was built, or before?

[*Same objection.*]

A. That I don't remember; I think it was a short time after they took an interest in the clock; I ain't positive.

Cross-Q. 971. Will you describe the features of the case of the second Grissinger clock?

[*Same objection.*]

A. I will try; I am guessing at the length, you know. It may have been four feet and a half or five feet—the extreme length of the case, about sixteen or eighteen inches in width; a glass door covering the front of the whole case; that is, including the dial and pendulum. I don't remember whether the dial was made of Bristol board or metal, —I think enamelled Bristol board. The case was carved at top, bottom, and sides.

Cross-Q. 972. Were the cases of the two clocks built by the Grissingers, and of the Johnson Leonard clock, made of black walnut?

[*Same objection.*]

A. Yes, sir; the principal part.

Cross-Q. 973. Will you reflect, and state, as nearly as you can, how long it was after the Grissingers took up the business before this second clock was built?

[*Same objection.*]

A. I could hardly state. It was built the first year, I think, for I think they only operated one year, and I don't think that was an entire year that there was any work done.

Cross-Q. 974. Would you say that it was built during the latter part—say the last three months of the year 1878?

[*objection.*]

A. I couldn't say, because I don't recollect. I have no recollection what part of the year.

Cross-Q. 975. What was done with this second Grissinger clock when it was completed?

[*Same objection.*]

A. It was taken to the St. John's church, opposite Shiremanstown.

Cross-Q. 976. Is it there now?

[*Same objection.*]

A. As much as I know. The last time I was at church it was there.

Adjourned until Jan. 20, at ten, A. M.

Jan. 20, 1882, ten, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued.

Cross-Q. 977. Dr. John W. Moffitt, a witness heretofore called by Defendants, testifies (on page 521 [499] of Defendants' printed record) that he had one of your clocks in his house, he thinks in 1878, which was put there by the Company with his permission. Which one of the clocks you have described, was this?

[*Same objection.*]

A. That was the one which I described with a large brass dial, silvered. To the best of my recollection, it was the first one made by the Clock Company, or Grissingers.

Cross-Q. 978. What first directed your attention to the invention of a clock run by an earth battery?

[*Same objection.*]

A. I don't know how to answer that. I was experimenting in electrics some; that is, I was experimenting with electro-magnets and permanent magnets; really, my first experiments on that was—I placed an electro-magnet on to a table or bench, and suspended an armature at a point above the poles of the electro-magnet, allowing the armature to hang in front of the poles. I caused a current to pass through the electro-magnet, which would attract the armature; then, by breaking the current, the armature would move away from the poles, and by means of making and breaking the circuit I could keep up a vibration of the armature. Then, at different other times, I further experimented by polarized armatures; that is, short bar magnets, in front of the electro-magnet, making and breaking the circuit in that way, the armature would be attracted and repulsed—finding in that way I could get better results; by the same electro-motive power the armature would move back and forth with more power. I don't remember all the different experiments I then tried, as there was a good many different experiments. I know I had placed the magnets in different positions; that is, the electro-magnets and permanent magnets. Instead of using a bar permanent magnet, I sometimes used permanent magnets in various shapes. I had used a U-shaped permanent magnet, the poles of the permanent magnet suspended above the poles of the electro-magnet, though a little to the right or left of the electro-magnet. By that means I got better results in vibrating the suspended permanent magnet, or, as we may term it, the pendulum. I don't remember what first directed my attention to running a clock by an earth battery; the first thing I did in that direction was placing the plates in a box of earth and wetting the earth; that is, by plates, I mean a positive and negative, a copper and a zinc.

Cross-Q. 979. Had you, before you made the experiments mentioned in your last answer, or before you constructed your first train of gearing to be run by an earth battery, read any account of electric clocks run either by an earth battery or by a battery of any other kind?

[*Same objection.*]

A. I don't think I did. I read, at some period, of electric clocks, but I think that was after my first experiments. I know I wasn't guided by any other work when I made them first pendulums.

Cross-Q. 980. Had you read anything before you constructed the first train of gearing, which you have previously described, to be run by an earth battery?

[*Same objection.*]

A. I don't remember that I did. I know when I was running an experiment of that kind, I generally run the experiments on my own suggestions, because in referring, sometimes I was lead astray in that way. I found, trying these experiments, that at times they would not answer the purpose, and I would not gain any knowledge.

Cross-Q. 981. Have you ascertained the name of the mechanical encyclopedia, published in New York, that you referred to the other morning?

[*Same objection.*]

A. No, sir; I have forgotten to look for it.

Cross-Q. 982. Will you ascertain the name to-night, and also the names of all the other works which you have in your possession on mechanical subjects, or on chemistry, or electricity, or magnetism, and bring them with you to-morrow?

[*Same objection.*]

A. I will, if I don't forget it.

Cross-Q. 983. Do you remember whether the New York encyclopedia contained any articles on electricity and its uses and applications, or on magnetism and its applications and uses?

[*Same objection.*]

A. Yes, sir; it did. I know it did, but to what extent I do not remember. The work was a general mechanical work, not alone on the subject of electricity and magnetism.

Cross-Q. 984. When did you obtain that work?

[*Same objection.*]

A. That I could hardly answer. I don't remember, though it is a good while ago. I don't remember when.

Cross-Q 985. Was it near the time of its publication, or before you moved into your present shop?

[*Same objection.*]

ELEPHONE COMPANY,-2

A. It wasn't near the time of its publication. It was a good while after that, but the period of time I cannot give. I don't remember whether it was before or after I moved into the present shop.

Cross-Q. 986. Where did you get it?

[*Same objection.*]

A. I think I got it from one by the name of Samuel Urich. I am not positive. I think I borrowed the work from Urich. It is not my own work. I know I borrowed the work.

Cross-Q. 987. Do you remember whether there is an article in that work on electric clocks?

[*Same objection.*]

A. Yes, sir; I think there is, but I don't remember reading the article at the time I made my first experiments on the clock. I don't think I had the work at that time.

Cross-Q. 988. Does that article speak of electric clocks run by earth batteries?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 989. Will you ascertain how many pages of that book are devoted to the subject of electricity and its various applications and uses, and of the various titles relating to the application and uses of electricity, and also the number of pages devoted to magnetism and electro-magnetism and their applications and uses, and the titles of the subjects?

[*Same objection.*]

A. I will try. The work is in two volumes. I ain't too sure whether both volumes are in my possession now or not.

Cross-Q. 990. Do you remember whether there were any articles on the subjects of electricity and magnetism and their uses and applications, in the English encyclopedia which you borrowed from Mr. William R. Gorgas?

[*Same objection.*]

A. I don't know, indeed; that work was published in quite a number of volumes; I only had one or two volumes; I ain't positive whether I had one or two; that I had borrowed, more particularly, to study the subject of drawing.

Cross-Q. 991. Have you borrowed other books, which treated the subject of electricity and magnetism, or consulted such books in any libraries to which you have had access?

[*Same objection.*]

A. No, sir; not to the best of my recollection, I have not.

Cross-Q. 992. Did you make an application for a patent, or patents, relating to your electric clock, or to the battery by which it was run? If so, state when you made such applications, and how many of them there were?

[*Same objection.*]

A. I did not make an application alone; the Clock Company furnished the money. There were, an application for an earth battery, and an application for a magnetic clock; I can't state when it was; I think it was in 1878; it was during the time the Clock Company got possession; I think, in the former part of their possession, that the applications were made.

Cross-Q. 993. In the application upon the earth battery did you claim such batteries as your invention, or only some modification of them, and if the latter, what was the feature which you claimed?

[*Same objection.*]

A. The general feature of the claim was this; claiming an earth battery by enclosing or enveloping a copper plate by felt, or may be there were other things in the claim I don't recollect—by felt or its equivalent, or something that way, and enveloping the zinc plate by carbon; the general language of the claim I can't give; I don't remember.

Cross-Q. 994. When did you make that invention?

[*Same objection.*]

A. I couldn't positively give you when I did; I had been experimenting for a long time; I know I had enveloped them plates in different substances that I don't remember, and in cloth and paper, and I know them experiments were at different times.

Cross-Q. 995. How long had you been experimenting with or using felt, at the time of your application?

[*Same objection.*]

A. I couldn't state how long; I don't remember; it may have been a year, or six months, or less, or it may have been more than a year; the length of time I can't give.

Cross-Q. 996. Was there a patent granted on that application?

[*Same objection.*]

A. Yes, sir.

Cross-Q 997. Doesn't the article on electric clocks, in the New York encyclopedia, speak of an earth battery having the plates embedded in coke?

[*Same objection.*]

A. I positively do not know.

Cross-Q. 998. What did you claim as your invention in your application on the magnetic clock?

[*Same objection.*]

A. I can't state all the different claims; there were a great many claims; I might state the general principles claimed; that is, I claimed a magnetic clock, the pendulum being moved or vibrated by the repulsion—I can't word the claim right—of a permanent magnet from the poles of an electro-magnet; I don't know how to express the idea; I can't explain it without a long explanation of my experiments. Another claim was a compensating pendulum, and another was the mechanical construction of the make and break; I don't remember all the claims. Another was on the construction of the movements—some parts of the movements; that is all that I can remember, that I can state now.

Cross-Q. 999. Will you give a history of your experiments, so far as it may be necessary to explain the invention relating to the movement of the pendulum by the repulsion of magnets?

[*Same objection.*]

A. I will try; that was at an early period; I had put up a temporary pendulum made of wood, with a permanent U-shaped magnet attached to the lower end of the pendulum, and an electro-magnet so placed below the permanent magnet, so as the pole of the permanent magnet, when swinging, would pass close to the poles of the electro-magnet. I found, by experimenting, that I could magnetize the permanent magnet by a very feeble current of electricity passing around the cores of the electro-magnet; by causing the pendulum to vibrate by touching it with my hand, keeping up a vibration for a certain length of time. The first few impulses—the number I couldn't state—the pendulum would cease to vibrate, and I knowed that the permanent magnet wasn't sufficiently magnetized, but by continuing to make it with the hand for a sufficient length of time, it would then continue to vibrate by the minute electro-motive power, which was very feeble, I know. After running, or allowing the pendulum to vibrate, a day or two, I would take off the permanent magnet, to ascertain its lifting capacity, or whatever you may style it, by a little balance that I got up temporary out of wood. I would then replace the permanent magnet and take off or disconnect the battery power from the circuit, but I would join the two ends of the coils of the electro-magnet and then start it to vibrate, and found that it would vibrate for a certain length of time, though longer than it would have if I had had no electro-magnet connected. I found in that way that it would run an hour, or sometimes two or three—keep vibrating. The vibrating of the pendulum would get more feeble until it would stop, or nearly so. I then would take off the permanent magnet again, and try its lifting capacity on this balance, and found it a great deal less than before. I thought by that experiment, and think yet, that the power got there was obtained by the saturating or over-saturation of magnetism above a normal state of natural magnetism. It is hard for me to describe or explain it That claim was based on that. There was a claim drawn up to cover that experiment.

Cross-Q. 1000. What was the peculiar feature of your compensating pendulum, and when did you make that particular invention?

[*Same objection.*]

A. It would be hard for me to describe it without making a sketch of it.

[*Witness draws sketch, which is put in evidence and marked* "*Drawbaugh compensating pendulum exhibit.*"]

Recess for dinner until 2, P. M.

Jan. 20, 1882, 2, P. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

[*Mr. Jacobs objects to the sketch and the examination of the witness the subject of the compensating pendulum, or the peculiar construction of witness' magnetic clock, on the ground that an application is pending for letters*

EPHONE COMPANY,-2

patent therefor, at the present time, in the United States Patent Office, and that witness is not bound to divulge any part of his invention until the same shall have been patented.]

(*Witness continues.*) AA are two brass rods permanently fastened to an upper cross-bar C by pins through bar and rods; BB are two steel rods, also fastened in upper cross-bar and in lower cross-bar D; FF are two metal levers secured to lower cross-bar D by screws or rivets, it is not particular which. The lower ends of brass rods A rest upon the levers FF, towards the outer ends.

Another short steel rod E, the lower end of which is secured to pendulum ball G.

At a short distance above upper edge of pendulum ball G is a pin I, secured to steel rod E, which said pin rests upon the inner ends of levers FF.

HH are two metal screws, passing through and riveted, but all but allowed to turn at the inner ends to small projections.

Said screws are threaded and fitting a screw thread on a projection at the lower end of brass rod A for the purpose of adjusting lower end of brass rods inwards or outwards on the lever ends FF.

The expansion of the rods AA, acting upon the levers FF, counteracts the expansions of steel rods BB.

It may have been invented as early as 1874, or it may have been as late as 1876, to the best of my recollection, as I have no distinct recollection when I first made it.

Cross-Q. 1001. Upon which of the clocks which you have described was this pendulum placed?

[*Objected to by Mr. Hill as immaterial and irrelevant, and as new matter not referred to in the examination-in-chief.*]

A. Upon the clock that Johnson Leonard had, and the one that is now in Mr. Jacobs' office, and upon the clock which is now in St. John's church, a brick church opposite Shiremanstown.

Cross-Q. 1002. Has any patent been allowed and issued on your application on the clock?

[*Same objection.*]

A. Yes, sir; so I am informed—one has been allowed but not issued.

Cross-Q. 1003. What other electrical inventions or apparatus besides what you have heretofore described have you made, or invented, or experimented upon since you moved into the shop you now occupy, and before the commencement of this suit?

[*Same objection.*]

A. I have been working on a good many things. I don't know whether I can think of all. I experimented and made an apparatus for signaling and telegraphing. I termed it a magneto-electric telegraph, and another, which I termed an alphabetical telegraph, a magneto-electric machine also; and I also experimented a good deal on electro-magnets and permanent magnets, but them experiments related more on the telephone than on other apparatus. That is all that I can think of.

Cross-Q. 1004. Some of the witnesses who had been called for the Defendants have spoken of an electric fire alarm. Did you invent and make an apparatus of that kind during the period specified?

[*Same objection.*]

A. Yes, sir; I used one of those magneto signalling bells, and secured it to the upper part of the wall of the shop, towards the ceiling. There was another portion, then, composed of a strip of wood, or the pith of wood, cemented or fastened to the side of a piece of thin metal, which was intended to be placed on the ceiling of a room. To the metal was secured a wire, which was connected to one pole of a battery.

At the opposite end of the metal and wood there was a bracket secured to a small base. There was a wire attached to that, which was attached to the opposite pole of the battery.

A temperature of about between 90 and 120 degrees of heat would cause a junction of the metal and wood bar to come in contact with the bracket, which was secured to the small base, which would then form an electric circuit through the alarm bell, which was before mentioned.

Cross-Q. 1005. When did you construct this apparatus, and how long was it set up and exhibited in your shop, if it was exhibited?

[*Same objection.*]

A. I could hardly say when—1872 or 1873, or perhaps as late as 1874, or perhaps later. I could hardly say exactly. It might have been there a year or two, but not a battery connected with it all that time. There is a portion remains yet at the shop.

Cross-Q. 1006. Where were the different parts placed?

[*Same objection.*]

A. In a room—the wood department. To exhibit it, though, I had

LEPHONE COMPANY,-2

taken it from the ceiling and laid it in the neighborhood of the stove, to show the working of it, and I might have had that portion of it in different other rooms.

Cross-Q. 1007. Did you, after you moved into the shop, construct one or more galvanometers, and if so, how many, and when did you construct them?

[*Same objection.*]

A. Yes, sir; I constructed two, I think, while I was in that shop, and one before I went to that shop. I can't exactly tell when. I will get at it as near as I can. It may have been as early as 1872, or as late as 1877, though the first one of the two I constructed a year or two before I constructed the last one. A year or two intervened between them, maybe three years.

Cross-Q. 1008. Did you invent these instruments, or did you construct them from descriptions which you found in works on electricity?

[*Same objection.*]

A. I did not invent the first one. The second, I improved to some extent; and the third one I still improved more. I got them up for my own use, for my electrical experiments.

Cross-Q. 1009. Did you construct the one you made before you went to that shop from a description which you found in some work on electricity, or did you copy it from some instrument of which you had knowledge?

[*Same objection.*]

A. I don't now know where I got my knowledge from for the construction of it. At that day I didn't have many scientific books. I had one or two old school philosophies. It might have been, perhaps, that I seen a description of it in them.

Cross-Q. 1010. How long did you keep that instrument?

[*Same objection.*]

A. I have got it yet—part of it.

Cross-Q. 1011. Will you describe the instrument, either by words or by a diagram, whichever is the easiest for you?

[*Same objection.*]

A. I will make a sketch.

[*Witness draws sketch, which is put in evidence and marked* "*First galvanometer diagram,*" *figures* 1 *and* 2.]

Figure 1 is a side view, and figure 2 is a top view. A represents a base board; B a coil of insulated wire; C a needle; D a cord suspending the needle; E a metal rod for supporting the suspended needle. The longest diameter of the coil might have been three inches, and the needle was two inches, or, perhaps, two and a half long. According to my judgment, there may have been between 40 and 60 turns in the coil. The wire may have been between 26 and 30, I don't know. The needle was suspended from the arm, and had no support below it.

Adjourned until January 21, 1882, at ten, A. M.

January 21, 1882, 11.15, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 1012. Will you state generally how the two galvanometers, which you built after the first one, differed from the first one, either in size or plan of construction?

[*Same objection.*]

A. The only difference in the plan of construction of the second is that there was two needles—a needle placed at the top of the coil—and the instrument was encased. The size of the coil was about the same, to the best of my recollection. The third galvanometer was composed of a coil somewhat similar to the others, though of much thinner wire. The gauge of the wire I don't remember. The opening of the coil was somewhat larger, and in that were placed two needles, oppositely polarized; that is, the poles standing in opposite directions; a needle underneath the coil and one at the top of the coil, besides the two inside of the coil, I think. The needles that were placed between the coil were much larger, and magnetized so as to counteract the attraction north and south, only allowing a small attraction north and south. This third galvanometer was also placed in a casing. That is as near as I can describe it.

Cross-Q. 1013. Were the two needles of the second instrument and the four needles of the third, supported by one support, so as to vibrate together?

[*Same objection.*]

A. Yes, sir; a small support.

Cross-Q. 1014. Were they suspended by a cord, as in the first instrument, or did they rest upon a bearing below the needles?

[*Same objection.*]

A. They were suspended on a thin fibre of silk; that is, the two last galvanometers.

Cross-Q. 1015. Before you constructed these last two instruments, had you seen descriptions of galvanometers provided with multiple needles, similar to those your galvanometers had?

[*Same objection.*]

A. I may have, before constructing the second one of the three. I think I had seen it stated somewhere of two needles.

Cross-Q. 1016. Were these galvanometers provided with dials, by which the amount of deflection of the needles could be observed?

[*Same objection.*]

A. Yes, sir; the last two were.

Cross-Q. 1017. Have you ascertained the name of the New York encyclopedia as requested yesterday, and taken a list of the other works which you have in your possession on mechanical subjects, and on chemistry, electricity, and magnetism? If so, please state what you have learned.

A. Yes, sir; I have. "Cyclopedia of Useful Arts," two volumes, by Charles Tomlinson, and to get at the date of it I will have to read a little more of the title: "An Introductory Essay on the Great Exhibition of the Works of Industry of all Nations, 1851." This is the work which I referred to as the encyclopedia in my possession, and is the one I borrowed from Urich. I looked in the work this morning to ascertain the number of pages on electricity and electro-magnetism. The number of pages on electricity is fourteen; the number of pages on the electric telegraph is eight; the number of pages on electro-metallurgy is eleven; on electro-motive machines, five pages; pages on magnetism, three and a half,—only on earth magnetism and the dipping of the needle, it just refers.

Then I looked up some other books: "A Practical Manual of the Collodium Process," by S. D. Humphery, of New York, 1857; "The Photograph Manual," by N. G. Burgess, 1859; "Class Book of Chemistry," by Edward Youman, 1851; "Parker's Philosophy," revised edition, 1855. It has my name on the first blank leaf, and date of purchase, 1856; "Natural Philosophy," by J. L. Comstock, 1848. On the front fly-leaf my name is written, dated 1852. There are a few other works that I got lately—within a few weeks past: "Deschanel's Natural Philosophy," by Professor Everett, 1878; "Elementary Lessons in Electricity and Magnetism," 1881. The last book I got only two or three days ago.

Cross-Q. 1018. What was the apparatus which you referred to in your answer to the 1003d interrogatory, in these words: "I experimented and made an apparatus for signalling and telegraphing. I termed it a magneto-electric telegraph." What uses was it designed for?

[*Objected to by Mr. Hill as irrelevant and immaterial, and as new matter not referred to in the examination-in-chief.*]

A. It was designed for signalling and telegraphing. It was an electric apparatus. I couldn't describe it, unless I would make a drawing of it; it is so hard, and there are so many parts, that I couldn't.

Cross-Q. 1019. Do you mean, by telegraphing, that it was to do the same work as the ordinary Morse telegraph, and other known telegraph instruments?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1020. What do you mean by signalling—is that something different from what is ordinarily known as telegraphing, and if so, what was it?

[*Same objection.*]

A. I had used it with signal bells attached to the instrument.

Cross-Q. 1021. Where had you used it in that way—where was the apparatus placed, and where were the bells placed, and how many of them were there?

[*Same objection.*]

A. They were in different parts of the shop; that is, I changed them to different places; I could not state accurately. I had the bells also in my house, at times.

Cross-Q. 1022. Do you mean that you had the signalling apparatus in your shop, connected with bells for receiving the signals at your house, so that you could send signals from your shop to your house?

[*Same objection.*]

A. No, sir; I never had it attached in that way—not to the best of my recollection.

Cross-Q. 1023. When you had the bells in your house, at times, with what were they connected?

[*Same objection.*]

A. With the signalling apparatus; you might term it a magneto transmitter. I could not answer in no other way. That was also in my house, but connected to a short line.

Cross-Q. 1024. In what part of the house was the transmitter, and where were the bells placed, and was the short line wholly within your house, or did it go outside of your house?

[*Same objection.*]

A. The one instrument would be in one room, and the receiver, I suppose, would be in the next room, or two rooms; the line would be within the house. That I would do in the evenings, after leaving my shop, for the purpose of experimenting.

Cross-Q. 1025. When there were two or more bells, were they connected to the transmitter by one common circuit, or by different circuits?

[*Same objection.*]

A. To describe that, it will be necessary to give you some little experiments on that.

There were different plans that I was experimenting on. The transmitting instrument was provided with a number of push-buttons, or keys; the number I don't remember—eight or ten. In one plan that I was experimenting on, there were a number of bells placed on the same line; the various bells, that is, the electro-magnets of the various bells, were of different resistance, I may say.

The armature of the transmitter could be controlled, so that it would ring a bell of high resistance, or of a resistance to correspond. I mean, with the distance of movement of the armature. By that means I could signal one bell, and not any other bells on the same line. The idea of that was to be used on longer lines; for short lines I would use one main wire, that would attach to one pole of the receiver, and the pole that would correspond on the transmitter; and another wire connected with the main wire for each bell, from a push button, up to the number that would be desired to use. That is as near as I can give the idea; I think that is all right.

Recess for dinner until 2 o'clock, P. M.

January 21, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 1026. The office of the push buttons, I suppose, was to close the circuit, when you desired to ring the bell in that branch, and that there were as many different bells as there were push buttons?

[*Same objection.*]

A. Yes, sir; but I never had as many bells attached to it as there was push buttons; the highest number of bells that I had, I think, was three, but it would have operated as many bells as there was push buttons.

Cross-Q. 1027. What was the size of those bells?

[*Same objection.*]

A. Some of them,—that is, two of them, I think,—were three inches, or three and a half, in diameter; and another bell that I used, was about five or six inches in diameter, as near as I can recollect.

Cross-Q. 1028. The hammers of these bells, I suppose, were connected to the armature of the electro-magnet at each bell, so as to be operated by the magnetizing and demagnetizing of the cores of the electro-magnets?

[*Same objection.*]

A. Yes, sir; only there was a little difference of construction in some of them; that is, the hammers were attached to a rod that was connected to the armatures, in some of them; in some there was a little difference in that respect.

Cross-Q. 1029. Was it necessary to have a difference of resistance of the coils of the electro-magnets of the different bells, when they were in separate branch circuits, which were to be closed by a push button, when the bell was to be rung?

[*Same objection.*]

A. No, sir; not in different circuits.

Cross-Q. 1030. When the bells were in the same circuit, the push buttons, I suppose, were not required?

[*Same objection.*]

A. No, sir; but they could have been used.

Cross-Q. 1031. The difference of resistance in the different coils, when the bells were in one circuit, was obtained by winding a greater or less number of turns upon the coils?

[*Same objection.*]

A. Yes, sir; by that, and then again, by the difference in the number of the wire; and also by putting into the line any manner of resistance, which there would be a good many different ways of resistance.

Cross-Q. 1032. I suppose the object of having a different resistance in the coils was to give a different degree of magnetization to the cores, through the same current, so that the armature of one electro-magnet might be made to move and ring its bell, while the armatures of the other electro-magnets remained stationary?

[*Same objection.*]

A. Yes, sir; not alone the resistance in the coil, but the resistance in the line also.

Cross-Q. 1033. And the ringing of the different bells was to be effected by sending currents of different strength corresponding to the bell you wanted to ring?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1034. Will you describe the manner in which the current was generated in this apparatus; and the manner in which you secured difference of strength to correspond to the different bells, making a diagram if you choose, to illustrate it?

[*Same objection.*]

A. I will try and answer without making a diagram.

The portion of the instrument, which we will term the transmitter, was composed of a permanent compound magnet, secured underneath a base made for that purpose, resting horizontally.

There was an electro-magnet secured to the base.

The electro-magnet was held, or placed at right angles with the permanent magnet, or vertically above it. The poles of the core of the electro-magnets were about a quarter of an inch above the sides of the poles of the permanent magnet. Said cores were hollow, about half an inch in diameter, as near as I can remember.

At the end of the cores, next the poles of the permanent magnet, were placed short cores of steel. Each of them were attached by a brass rod for each core.

Said rods passed up through the center of the core of the electro-magnet, and were attached to an armature, which was placed movable above the upper ends of the cores of the electro-magnet. One of those brass rods was attached to each end of the armature.

In the center of the armature was attached a metal bracket, for the purpose of holding one end of a lever. At the opposite end of the lever was a button, for the purpose of operating said lever. More strictly speaking, that button was attached to an adjusting screw. The adjusting screw passed through the opposite end of the lever. On the side of the frame of the transmitter were a number of push buttons. The number I now forget. On the opposite of this apparatus were the same number of screw-cups. There was an arrangement that I didn't have any name for—a slide with steps on it, which would slide under the lower end of the set or adjusting screw, which would limit the movement of the lever, and also would cause strength of current corresponding with the resistance required for the different bells.

Cross-Q. 1035. Will you give the size of the permanent magnet, and the number of leaves in it, and the dimensions of the electro-magnet and its coils?

[*Same objection.*]

A. The size of the permanent magnet may have been eight or ten inches long. It was a horse-shoe magnet. The number of leaves I don't remember—perhaps five or six in number.

The length of the electro-magnets—in the neighborhood of two inches, as near as I can remember. Diameter of the coils, an inch and a quarter or an inch and a half, as near as I can remember.

Cross-Q. 1036. Were the short cores of steel, which you mentioned, placed between the lower ends of the cores of the electro-magnet and the face of the permanent magnet, and were they connected with the armature above the electro-magnet so as to be moved with it?

[*Same objection.*]

A. The diameter of the steel cores corresponded with the inside diameter of the hollow cores. They were allowed to move in the hollow cores and were attached to the brass rods. The brass rods were attached to the armature.

When the armature rested on the upper end of the electro-magnet cores, the steel core rested on the face of the permanent magnet. That would answer your question. The steel cores were in length between five-eighths and an inch. I don't remember exactly.

Cross-Q. 1037. Was the armature lever, when the instrument was used, operated with the hand directly, or through any other mechanism?

[*Same objection.*]

A. By the hand.

Cross-Q. 1038. Now, if I understand this apparatus, the differences in the strength of the current, to correspond with different bells, was secured by the difference in the range of movement of the lever and the armature?

[*Same objection.*]

A. Yes, sir; the further the armature moved from the permanent magnet the greater would be the strength of the current. I am sure of that.

Cross-Q. 1039. What provision, if any, did you have for preventing the bell requiring the weakest current to ring it, from ringing when a stronger current was sent through it?

[*Same objection.*]

A. The armature of the one was retarded by a spring, you know, that a certain current—that the one current wouldn't be sufficient to move the armature. I can't hardly give you the right language. I know that I had worked them in that way. I had a mechanism, and I know I rung them; and it is so long that I almost forget it; but I will get that, for I did it.

Cross-Q. 1040. You spoke of one arrangement with a series of bells on one circuit, to be used on long distances; and another arrangement with bells on branch circuits, to be used for short distances. For what different purposes did you design to use these two arrangements? What did you mean by long circuits and what by short circuits?

[*Same objection.*]

A. On long circuits, the idea was of using resistance, so that you would not have to use so many wires, but I never used it on a long circuit.

I had no particular purpose. You could use it for different purposes. My idea of the short circuits was that it could be used in a business office to signal different apartments in a manufactory or hotel, or whatever place it might be applied.

Cross-Q. 1041. When did you construct this apparatus, and how long did you experiment with it?

[*Same objection.*]

A. It would be hard for me to say when I constructed it. I will give myself plenty of room—between 1871 and 1874. That is coming pretty near it. I worked at it, I suppose, at different times, and might have experimented with it a year or more. I was not at it constantly—certainly not.

Adjourned until Jan. 23, 1882, at ten, A. M.

Jan. 23, 1882, *ten,* A. M.

Adjourned until Jan. 24, 1882, at ten, A. M., on account of the illness of Daniel Drawbaugh.

Jan. 24, 1882, *ten,* A. M.

Adjourned until January 25, 1882, at ten, A. M., for the same reason.

Jan. 25, 1882, *ten,* A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 1042. Did you, in the course of your experiments, have a magneto-telegraph, or signalling transmitter, in a different form from that which you have last described?

[*Same objection.*]

A. Yes, there was modifications and changes on the instrument.

Cross-Q. 1043. Can you state generally what those modifications were?

[*Same objection.*]

A. I guess I could.

Cross-Q. 1044. Will you go on and describe them generally?

[*Same objection.*]

A. I don't know whether I could describe them all, because it is so long back. At one period, I had the electro-magnet stationary, and the poles were not hollow, and the permanent magnet was secured to the base, being pivoted, and the back end of the magnet having a press-button which would, by pressing on it, make a rupture between the permanent magnet and the poles of the electric-magnet. I don't remember distinctly whether, after the modification, I used all these parts. After making these modifications, I did not use the natural magnet, which had been on the original instrument. I made a new permanent magnet.

Cross-Q. 1045, Won't you describe the size and shape of the permanent magnet that you used in the modification you have last spoken of?

[*Same objection.*]

A. I think it was described in a former question. That permanent magnet which is the new one, is the one I have already described.

Cross-Q. 1046. If I understand you, the instrument which had the plunging core was the second modification, the last one you have described being the first one?

[*Same objection.*]

A. Yes, sir; but the length of time between—I don't know how long, but it was but a short time.

Cross-Q. 1047. What was the size and shape of the first permanent magnet?

[*Same objection.*]

A. It was horse-shoe shaped. The length of it, between four and six inches. There may have been five, six, or seven, or, perhaps, eight leaves. It was a compound magnet.

Cross-Q. 1048. And did you use the same coils in both forms of the apparatus for the electro-magnet?

[*Same objection.*]

A. I think I did, at first.

Cross-Q. 1049. Do you remember any other of the forms in which you put this apparatus?

[*Same objection.*]

A. There were other forms, but I don't remember them now. I remember of having a compound switch. The intention of that switch was to switch the current on the line in opposite directions.

Cross-Q. 1050. What provision did you have, when using these transmitters to ring bells, for preventing a bell requiring a weaker current being run when a stronger current was sent through?

[*Same objection.*]

A. I had a plan of ringing—I think it was three bells. I have been thinking of it since, but I don't remember how I did it; I may have used my compound switch; by that I could ring two bells of the same resistance, or even one bell of less resistance. I don't remember in what way I did it.

Cross-Q. 1051. Did you use these transmitters, which you have described, for telegraphing, as distinguished from signalling by means of the bells?

[*Same objection.*]

A. I don't exactly understand that question. You could place a receiver—a sounder—the sounder would have to be fitted with a polarized armature, as an ordinary sounder wouldn't operate—in place of a bell; you could have used the transmitters with such an apparatus, but I didn't.

Cross-Q. 1052. Did you ever make a trial of these transmitters on a telegraph line for telegraphing?

[*Same objection.*]

A. Never,—no more than what short lines I made myself.

Cross-Q. 1053. Did you ever make a trial of any telegraph apparatus, of your own construction, upon a telegraph line?

[*Same objection.*]

A. I did, yes; no one knows it but myself. I tried a polarized armature on a line that runs by White Hill, one night; I placed a plate on to the damp ground, and attached it to the sounder, which was a polarized armature sounder; there was another wire, with a small stone attached to one end of it, which I threw over the line, to find out whether I could work with more power, or whether it would work with less adjustment of the sounder; I found it would work, provided I had the right poles attached; I found it was operative, but I could not read the signals, as I never studied telegraphing. That is the only line.

Cross-Q. 1054. What transmitter did you use in this trial?

[*Same objection.*]

A. No transmitter.

Cross-Q. 1055. Some of the witnesses have spoken of a dial instrument which you had; what is the general character of that instrument?

[*Same objection.*]

A. That is a little complicated; it will be a little hard for me to describe, unless I make a sketch of it. The transmitter was composed of a permanent magnet; and on the poles of the permanent magnet was placed an electro-magnet; these were placed into a case or box; in said case was a frame or reel; on that reel were placed half as many polarized armatures as there was letters of the alphabet; on the outside of the case there was a dial and an indicator, which would be the crank of the reel.

That represents the transmitting part. The receiving instrument was composed of parts about as follows. A train of gearing or clock work; the last wheel was an escapement wheel, the journal of which carried the pointer moving around the dial; there was a coiled spring in the train, that would wind up similar to a clock.

A little ways from the edge of the escapement wheel was placed a lever, which supported or carried a verge; said verge rested against the edge or teeth of said escapement wheel; at one end of the lever was attached a polarized armature, which was operated by an electro-magnet; causing a current to pass around the cores of the electro-magnet, would cause the armature to move towards, or away from, the poles, according to the direction of the current sent through it. When the armature moves, that allows the escapement to move the space of half a tooth, and then the other end of the verge catches it; when the armature moves in the other direction, the escapement wheel again moves the space of half a tooth; and then again the opposite end of the verge catches another tooth, and stops the escapement wheel.

The machine worked by magneto currents and not by voltaic currents.

Cross-Q. 1056. This receiver, if I understand it, required one impulse of electricity to be sent through it for each movement of the escapement wheel, did it not; and each movement of the escapement wheel carried the pointer of the dial from one letter to the next?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1057. The instrument is what belongs to the class known as "step by step" instruments, is it not?

[*Same objection.*]

A. I don't know what it might be termed.

Cross-Q. 1058. Was this receiver placed in a case by itself, or in the same case with the transmitter?

[*Same objection.*]

A. It was in a case by itself, but the two could have been placed in the same case.

Cross-Q. 1059. How large were the dials of the transmitter and receiver, and how large the cases which held them?

[*Same objection.*]

A. I give that to the best of my recollection. The dials of the transmitter and receiver were both about of one size, which would be about six or seven, or maybe eight inches in diameter. The cases were a little larger, but not much larger, either; they were round.

Cross-Q. 1060. Where in your shop did you have these instruments placed?

[*Same objection.*]

A. At different places. Sometimes I would have the transmitter in that small room at the north corner of the shop, and the receiver in some other portion of the shop. Sometimes transmitter and receiver would both be in the same room. At other times I would have the instruments in the wood-working part of the shop. They may have been in other portions of the shop that I don't remember now.

Cross-Q. 1061. How did you operate those instruments in sending messages?

[*Same objection.*]

A. By moving the transmitter pointer to a certain letter on the dial, which would cause an impulse of magneto electricity to pass over the wire, which would cause the receiver to move the space of one twenty-sixth of a revolution.

Cross-Q. 1062. If I understand the transmitting apparatus, the current was generated in the coil of the electro-magnet by passing the permanent magnets on the reel, by the poles of the electro-magnet. Is that so?

[*Same objection.*]

A. The currents were generated by one of the polarized armatures coming in contact with the poles of the electro-magnet; that would cause a current in one direction. The same armature passing away from the poles would cause a current in the opposite direction. A soft iron armature would answer the same purpose; that is, I had it in both ways. They would come very close to the poles, but not in actual contact, as that would make the instrument work too hard.

Cross-Q. 1063. In using this apparatus, when you desired to indicate any particular letter, did you carry the indicator of the transmitter from the position it would occupy, to the letter you desired to indicate, at a single movement, or did you stop at each intervening letter?

[*Same objection.*]

A. I think you had to go in one direction; I think to the right. The dial was marked in what direction you should move the indicator. You moved the indicator right to the letter you wished, and then stopped a short time, and then moved it to another letter, until you had finished the word.

Cross-Q. 1064. What was the size of the permanent magnet, and the electro-magnet upon its poles, and what were the sizes of the polarized armatures on the reel?

[*Same objection.*]

A. The size of the permanent magnet was—it was the magnet I had used in one of the modifications of the instrument I described before—about four or five inches long. The electro-magnet had coils about an inch and a half or an inch and three quarters long, as near as I can remember. The diameter of the coils was about an inch and an eighth or an inch and a quarter. The polarized armatures on the reel were about an inch and three quarters, or perhaps two inches long, as near as I can remember.

Cross-Q. 1065. When did you construct this apparatus, and during how long a period were you experimenting with it?

[*Same objection.*]

A. I don't remember when, and the length of time I was experimenting I don't remember.

Cross-Q. 1066. State, as near as you can, when you constructed it, and who occupied the shop at the time you constructed it?

[*Same objection.*]

A. It was made and I had it, I know, before the Axle Company came there, but I don't know how long before that; I can't think of any circumstance to fix the time nearer than that.

Cross-Q. 1067. Was it constructed after you made the transmitting apparatus for signalling, which you have previously described?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1068. Did you ever try it on a telegraph line?

[*Same objection.*]

A. No, sir; no more than in my own place or shop.

Cross-Q. 1069. Were these instruments that you have described all the instruments which you made for telegraphing or signalling?

[*Same objection.*]

A. Yes, sir; I think so, to the best of my recollection.

Cross-Q. 1070. Mr. John Weber, a witness who has testified for Defendants, testified on page 256 [245] of the printed record, that you said to him on one occasion: "'I have invented a great many machines, such as telegraph'—then showed me that he could telegraph by writing on a silver paper—tin paper—and put that to the wire, and it would write the same at the other end." What apparatus was that?

[*Same objection.*]

A. I had forgotten that I had a temporary apparatus, which I never had quite completed, worked or attached, to a wooden pendulum suspended, with an electro-magnet at the bottom of the pendulum, carrying a lever with a pencil or a marking instrument. But I only had put up the one. It would require two of those instruments to send and receive. I didn't have that long; the reason I abandoned it, it would be hard to regulate two pendulums at two stations, to vibrate the same number in a given time. I had made drawings of a complete machine, that is, a rough drawing, which I thought I could get over that difficulty, but never made the machine.

Cross-Q. 1071. When did you make these drawings and construct the instrument, as far as it was constructed?

[*Same objection.*]

A. I had put up that pendulum before I made the drawings, and the time I did it I don't remember; indeed I don't; it was before the Axle Company started there, and was while the old Faucet Company was there, I should suppose; I don't remember.

Cross-Q. 1072. Had you, before you constructed that apparatus, ever seen any account or description of an apparatus working on that principle?

[*Same objection.*]

A. No, sir; I did not; but I did after that.

Cross-Q. 1073. Where did you see it after that?

[*Same objection.*]

A. I don't remember whether I seen it in any publication, or whether some person told me.

Cross-Q. 1074. Was the dial apparatus your own invention--made without any knowledge of any similar apparatus?

[*Same objection.*]

A. Yes, sir; when I made that I had never heard of anything, I am positive. I mean anything of the kind.

Cross-Q. 1075. When you made your signaling apparatus, had you ever heard of any magneto apparatus for transmitting?

[*Same objection.*]

A. I never did before I made that.

Cross-Q. 1076. Mr. H. B. Musser, one of Defendant's witnesses, on page 333, [319,] of the printed record, says that at the time he was at your shop, you were making a belt, which you called an electric-belt. What sort of an apparatus was that, and when did you make it?

[*Same objection.*]

A. I can't tell when I made it. I made that for a daughter of mine to wear. I suppose I made it at the time he said. It was a number of years ago.

Cross-Q. 1077. Which daughter did you make it for?

[*Same objection.*]

A. Laura.

Cross-Q. 1078. Was that your own invention also?

[*Same objection.*]

A. No, sir; but I still made it different from most others, for the most of these belts have the two metals laid in contact, which I don't think is the proper way.

In wearing this belt, the way it was constructed, the plates were insulated one from the other, the copper from the zinc. Before wearing, which was to be done occasionally,—every evening or so,—there was an outside sheath, which would be made damp, and the belt placed into that.

Cross Q. 1079. Did you ever construct an electrical apparatus for signs?

[*Same objection.*]

A. Not that I can remember of now,—for signs.

Cross-Q. 1080. Did you ever give any attention to the subject of electric light?

[*Same objection.*]

A. No, sir.

Cross-Q. 1081. Did you ever give any attention to the subject of electrical machines for generating electricity, such as were used for the electric light?

[*Same objection.*]

A. No, sir.

Cross-Q. 1082. Did you ever employ any one to look up the subject of Brush's patents relating to the electric light?

[*Same objection.*]

A. Not to the best of my recollection.

Cross-Q. 1083. Did you ever consult Mr. Theophilus Weaver, of this city, in relation to any invention of yours, relating to vibrating signs operated by electricity, or in relation to the Brush patents on electric light apparatus?

[*Same objection.*]

A. I do not remember. He drawed up specifications for me on other inventions, and I often asked him to make search for me on different inventions, but I don't now remember what.

Cross-Q. 1084. What inventions did he draw specifications for: for you?

[*Same objection.*]

A. For the magnetic clock and a measuring faucet. That is all that I can remember now.

Cross-Q. 1085. Did you invent, at one time, a solar transit?

[*Same objection.*]

A. No, sir; I did not invent a solar transit. I constructed a rude arrangement from some old camera lenses, that I had there.

Cross-Q. 1086. When was that, and for what purpose did you construct it, and what use did you make out of it?

[*Same objection.*]

A. The time that I constructed it I don't remember. I had used it at the time I was making one of those magnetic clocks, to regulate or test the clock as to proper time keeping.

Cross-Q. 1087. Which one of the clocks?

[*Same objection.*]

A. I don't remember which one. It was one of the earlier made clocks. It was before I made the clock Mr. Leonard had.

Cross-Q. 1088. Did you ever see or hear anything about Edison's phonograph?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1089. When was that?

[*Same objection.*]

A. I couldn't tell you the year. It was, I think, during the time the Grissingers were in the shop.

Cross-Q. 1090. If you saw it, where did you see it?

[*Same objection.*]

A. I don't know that I ever seen the instrument. Yes, I seen one exhibited in a show, I think, in the summer of 1881. I meant by my previous answer, that I had heard of the instrument at an earlier time.

I saw the one referred to in a side show of a circus, here in Harrisburg, while we were taking testimony here last summer.

Since reflecting, I won't be too positive whether it was last summer, or the summer before, but I think it was the summer of 1881. I don't wish to be too positive.

Cross-Q. 1091. Did you ever construct one of your own invention. If so, when did you commence your experiments upon it, and when did you complete the instrument?

[*Same objection.*]

A. I constructed one. The time I don't remember, but it was at a pretty early time; though when I constructed that, I didn't make it a speaking phonograph. The first experiment I made, I used the old instrument "C." It was fit on the bed of an old turning lathe, which was truly planed off. Between that I put plaster-of-paris, and when the plaster-of-paris was of proper consistency, I scraped it off level with the bed.

At the bottom of the diaphragm of the instrument, was a pin that would just come in contact with the plaster surface, and I would make sounds—musical tones, and move the instrument while I was making the sounds.

After the plaster was dry, I would move that over in the same direction, and I found that it produced musical tones, which would be the same as the original, only faint.

The idea of that experiment was, to apply it to a clock, to denote the hour of the day by a few bars of music, adopting familiar tunes; but while experimenting, I found that it wouldn't be practical—it wouldn't be loud enough.

Them experiments, I know, were before I had ever heard of Edison's machine; I am positive of that. There are persons I know who have seen that at a middling early time.

By "between that" I mean between the slides of the bed of the lathe, on a board placed there for the purpose.

There was a certain consistency of the plaster, that was just right for that pin to work in; if it was too hard it would spawl off, and if too soft it would indent or come up at the sides.

Cross-Q. 1092. You say it was in a pretty early time; what do you mean by that?

[*Same objection.*]

A. I think it was during the former part of the Axle Company's operations there; I don't want to be too positive.

Cross-Q. 1093. Have you stated all that you did in relation to that invention?

[*Same objection.*]

A. Yes, sir; with the exception that I had used the plaster in a little different way. There was a little cylinder made of plaster-of-paris; the intention of that was to receive the musical tone of the different hours, and to be placed in a clock; but I had never put it into a clock; I thought it wasn't sufficiently loud.

Cross-Q. 1094. When did you make this last modification?

[*Same objection.*]

A. That was about the time that I had made the other, or a short time after that.

Cross-Q. 1095. Into what was this cylinder covered with plaster, fitted?

[*Same objection.*]

A. Into a little frame, for the intention of putting it into a clock.

Cross-Q. 1096. Who were the parties who saw this apparatus in either of its forms?

[*Same objection.*]

A. I don't remember who they were—different ones. But the most of my experiments on that were at night; I didn't show it to every one. I remember one person that seen it—a boy—one evening,—Mr. Jacob Fry. There were other persons that seen it, but I don't remember who they were. I abandoned it and didn't think much about it since.

Cross-Q. 1097. When you were using the signal bells in connection with your magneto transmitting apparatus, were they placed in different parts of the shop exposed to view or were they enclosed in any way?

[*Same objection.*]

A. They were not enclosed; they were just set on to a bench part of the time; sometimes when parties wanted to see them, I would just set them down, connect them and operate them.

Cross-Q. 1098. Were they fixed on a common base or frame of any kind, so that you could move them all together?

[*Same objection.*]

A. Yes, sir.

Recess for dinner until 2 o'clock, P. M.

Jan. 25, 1882, 2, P. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 1099. Several of the witnesses have referred to a machine, which you had in your shop, for wrapping wire, as they termed it, was that a machine of your own construction; if so, when did you construct it?

[*Same objection.*]

A. Yes, sir; it was of my own construction. Part of the apparatus I constructed, I guess, before I went down to the shop I am in now; I can't tell you when I finished it; I applied a part to it—a treadle; the former part you run by hand; it might have been 1870, or perhaps earlier, or perhaps later, that I made the change.

Cross-Q. 1100. Did you construct a machine for cutting gears, in connection with your work on clocks, or in connection with any other work?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1101. When was that?

[*Same objection.*]

A. After I moved from Mechanicsburg. To the best of my recollection, it was about that time. But before I made that machine, I had one that I borrowed from Mr. Shapley; one they termed a wheel engine.

Cross-Q. 1102. Which of those machines did you use in cutting the gears on the Johnson Leonard clock?

[*Same objection.*]

A. I don't remember distinctly, but I think I used the one I made myself.

Cross-Q. 1103. In speaking of the first train of clock mechanism, which you made, and I think also, of the second, you said part of the gears were cut by hand. Did you cut the other part of the gears yourself, or use parts out of a clock that had been previously cut?

[*Same objection.*]

A. I used it in a former clock. I cut a few gears by hand. I made a rachet, and the clock was not entirely finished. I did that to see whether it would move these parts. Then I constructed some other parts out of wheels that had been in other clocks; that is, I took wheels that had been used, and made changes. In some I cut out teeth. In the description that I gave there of raising levers, and producing the movements of the hour hand and minute hand, were just portions of teeth. I don't exactly remember when I got from Shapley that gear-cutter, but it was some time during the old Faucet Company's operation, but what year I can't state.

Cross-Q. 1104. That was before the Haucks moved into your shop I understand?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1105. How long had you known Mr. Shapley at the time you moved up to Mechanicsburg?

[*Same objection.*]

A. I couldn't tell, but I remember where I met him first, and we were talking about some of these inventions. It was in a lodge-room; that was the first time I met him, to have a conversation with him.

Cross-Q. 1106. What were the inventions that you talked with him about?

[*Same objection.*]

A. That I don't remember. I don't remember what. I think that was before I moved to the shop where I am now; I think so.

Cross-Q. 1107. Was he accustomed to come to your shop during the early years of your occupation of your present shop; if so, how often?

[*Same objection.*]

A. He was there, yes, sir, frequently, at a pretty early time. I don't remember what years. I don't remember positively whether he was there before I moved to Mechanicsburg or not, but after that he came several times; not in the early years of my occupation, for I had not become acquainted with him until just before the Faucet Company started, and before I went into the lower shop; but prior to that time, I know he did not visit me. I mean prior to that early time.

Cross-Q. 1108. The bill of J. R. Miller against you has been produced, (page 896, [862,]) which appears to have been made out on one of your own printed bill heads, headed "Bought of Daniel Drawbaugh," and

Jan. 25, 1882, 2, P. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 1099. Several of the witnesses have referred to a machine, which you had in your shop, for wrapping wire, as they termed it, was that a machine of your own construction; if so, when did you construct it?

[*Same objection.*]

A. Yes, sir; it was of my own construction. Part of the apparatus I constructed, I guess, before I went down to the shop I am in now; I can't tell you when I finished it; I applied a part to it—a treadle; the former part you run by hand; it might have been 1870, or perhaps earlier, or perhaps later, that I made the change.

Cross-Q. 1100. Did you construct a machine for cutting gears, in connection with your work on clocks, or in connection with any other work?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1101. When was that?

[*Same objection.*]

A. After I moved from Mechanicsburg. To the best of my recollection, it was about that time. But before I made that machine, I had one that I borrowed from Mr. Shapley; one they termed a wheel engine.

Cross-Q. 1102. Which of these machines did you use in cutting the gears on the Johnson Leonard clock?

[*Same objection.*]

A. I don't remember distinctly, but I think I used the one I made myself.

Cross-Q. 1103. In speaking of the first train of clock mechanism, which you made, and I think also, of the second, you said part of the gears were cut by hand. Did you cut the other part of the gears yourself, or use parts out of a clock that had been previously cut?

[*Same objection.*]

A. I used it in a former clock. I cut a few gears by hand. I made a rachet, and the clock was not entirely finished. I did that to see whether it would move these parts. Then I constructed some other parts out of wheels that had been in other clocks; that is, I took wheels that had been used, and made changes. In some I cut out teeth. In the description that I gave there of raising levers, and producing the movements of the hour hand and minute hand, were just portions of teeth. I don't exactly remember when I got from Shapley that gear-cutter, but it was some time during the old Faucet Company's operation, but what year I can't state.

Cross-Q. 1104. That was before the Haucks moved into your shop I understand?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1105. How long had you known Mr. Shapley at the time you moved up to Mechanicsburg?

[*Same objection.*]

A. I couldn't tell, but I remember where I met him first, and we were talking about some of these inventions. It was in a lodge-room; that was the first time I met him, to have a conversation with him.

Cross-Q. 1106. What were the inventions that you talked with him about?

[*Same objection.*]

A. That I don't remember. I don't remember what. I think that was before I moved to the shop where I am now; I think so.

Cross-Q. 1107. Was he accustomed to come to your shop during the early years of your occupation of your present shop; if so, how often?

[*Same objection.*]

A. He was there, yes, sir, frequently, at a pretty early time. I don't remember what years. I don't remember positively whether he was there before I moved to Mechanicsburg or not, but after that he came several times; not in the early years of my occupation, for I had not become acquainted with him until just before the Faucet Company started, and before I went into the lower shop; but prior to that time, I know he did not visit me. I mean prior to that early time.

Cross-Q. 1108. The bill of J. R. Miller against you has been produced, (page 896, [862,]) which appears to have been made out on one of your own printed bill heads, headed "*Bought of Daniel Drawbaugh,*" and containing below that the printed words, "PRACTICAL MACHINIST, small machinery, Patent Office models, electrical machines, etc., a specialty." When did you get those bill heads printed, and by whom were they printed?

[*Same objection.*]

A. I don't remember when I got them printed. I know by whom they were printed; by Ephraim Holsinger, who was a witness in this case.

Cross-Q. 1109. Did he print them while he was at Eberley's Mills?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1110. When did you begin to hold yourself out to the world as making small machinery, Patent Office models, and electrical machines a specialty?

[*Same objection.*]

A. I can't tell you. I made models of different kinds at a very early date. I can't tell you what date—a great while before I went down to the lower shop—and I know I made electrical machines before I went to that shop, I am positive.

Cross-Q. 1111. Do you mean that you made electrical machines for customers?

[*Same objection.*]

A. I don't remember that I did. I may have, but I can't just think of any now.

Cross-Q. 1112. Did you make electrical machines for customers after you went to that shop; and if so, what were they?

[*Same objection.*]

A. No, sir; I don't know that I did. I repaired. I made a portion of a clock for Mr. Shapley. I mean a magnetic clock.

Cross-Q. 1113. While the Haucks occupied the shop, did you have the use of the shop and tools, in the same manner as you had had while the Faucet Company was there?

[*Same objection.*]

A. Yes, sir; they gave me that privilege. I had a small room in the upper part of the shop that I occupied during the time they were there. The machinery, generally, was on the lower floor, and I did not use it unless they were not there, or were not using it. There was a pretty large portion of the time they occupied the shop that they were not running. There were months, sometimes, that they wouldn't come to the shop.

Cross-Q. 1114. When did they move their machinery away?

[*Same objection.*]

A. I think it was in the latter part of 1876; I think so; about that time; I can't remember; it may have been after; it may have been in the spring of 1877; I won't be positive.

Cross-Q. 1115. What machinery did the Axle Company put into the shop?

[*Same objection.*]

A. I will have to study that a little. There were a good many different machines. They purchased and put in two engine lathes; a drill press; they used a hand lathe that had belonged to Eberly, and that I had used there; and an emery wheel and machine for grinding axle bearings for boxes; a machine for polishing the inside of axle boxes. That is all that I can now remember.

Cross-Q. 1116. Did you have the privilege of using the machiney of the Axle Company while it occupied the shop?

[*Same objection.*]

A. Yes, sir; at times when they were not using, I used their machinery,—often at night.

Cross-Q. 1117. Has that machinery ever been moved away from the shop?

[*Same objection.*]

A. Some of it has; tools as a general thing—lathe tools, reamers, and things of that nature.

Cross-Q. 1118. When was it?

[*Same objection.*]

A. I don't remember what year; after they quit operating—quit work.

Cross-Q. 1119. Did not Mr. Chellis buy that machinery after he went there?

[*Same objection.*]

A. Yes, sir; but it had remained there for perhaps a year or a year and a half, or, perhaps, two years, that they were not doing much; that is, to the best of my recollection. The length of time I don't remember.

Cross-Q. 1120. Did the Grissingers put any machinery in there when they moved in?

[*Same objection.*]

A. Yes, sir; two small lathes, a grindstone, or rather two grindstones, one a surface grinder and the other an ordinary grindstone, some polishing wheels, some files. There were a few other small tools that I can't remember now.

Cross-Q. 1121. The Defendant's answer, on page 8, contains this statement: "That, notwithstanding his embarrassed and impoverished pecuniary condition, and his utter want of proper mechanical tools, materials, and appliances to conduct such work, he labored with all reasonable diligence to perfect and adapt his said improvements, and did, finally, in due exercise of such reasonable diligence, perfect and adapt the same." What portion of the time after you moved into that shop was it true, if at all, that you had an utter want of proper mechanical tools, materials, and appliances to conduct such electrical work as you had occasion to make?

[*Same objection.*]

A. Yes, sir; I don't think that I had the proper tools for making electrical apparatus.

Cross-Q. 1122. Do you think you had an utter want of proper tools?

[*Same objection.*]

A. Yes, I think I had; for it was necessary for me to have material to work on. In experimenting it was necessary for me to have a good many different materials that I didn't have.

Cross-Q. 1123. How came you to hold yourself out to the world as making electrical machines a specialty if you were in utter want of the proper mechanical tools?

[*Same objection.*]

A. I might have had an order for a machine, and then I might have supplied myself with the necessary material. I know in a good many other cases I did that. In some cases I would have an order and didn't have the money, and the party I made a certain instrument for would advance, though I do not know whether that was in any electrical machine or not.

Cross-Q. 1124. My question and the preceding one related to tools, not to materials. Do you think you had an utter want of proper mechanical tools?

[*Same objection.*]

A. I had, until the Clock Company; but I had no proper way of winding a magnet. I wound magnets up to that time by hand; that is, turned the spool by hand and held the wire in the other hand, which I know was not the proper way. There may have been other tools and apparatus that I cannot now think of. I know that I did not have the proper tools; I am confident of that. After they went in, they furnished the small lathes I spoke of, and after that I wound my magnets on a lathe.

Cross-Q. 1125. Will you name the parties who furnished you the means in advance to procure material for any machines which you had an order for?

[*Same objection.*]

A. I couldn't now. I know it has been done a number of times, but I can't name any parties now.

Cross-Q. 1126. Mr. Rufus K. Shireman, a witness who has been called by the Defendants, testifies on page 276 [264] of the printed record, that he saw at your shop an instrument of your invention, for registering drinks in a hotel; what kind of a machine was that, when was it made, and what became of it?

[*Same objection.*]

A. I don't remember that I said it was for registering drinks. It was an apparatus—you could place it, and it would register how often a gate or door would open, or you could apply it to an engine, to count the number of revolutions of the shaft. I had gotten that up for a party now living in Harrisburg, who got up an apparatus for weighing grain, and after he had got up his apparatus, it was necessary to have something to register the number of bushels that would pass through the machine. Now, about the drinks, that may have been said in the way of a joke; I don't remember the expression, though.

It would be hard for me to describe the machine. I termed it a counting machine.

It was composed of a number of wheels, got up in a peculiar shape. The principal wheel was a wheel with one cog or tooth on; right below that is a concave recessed wheel. To operate the first wheel of that description, there is in the center of that—where the hub would be—another small wheel provided with ten rachet teeth. Around these ratchet teeth is placed a lever arm with a pawl attached. By moving that lever ten movements, you cause the first wheel to make one revolution, which causes the second to make one tenth of a revolution, or pass one concave space; the third wheel would make one hundredth of a revolution; by moving the lever one hundred times you bring up a figure in the first wheel "I;" in the second wheel "O;" in the third wheel "O." By putting in a train of any number of wheels, you could count any number. I think 199,000 was the number that could be counted on the one I made for the party indicated. These gears were placed into a box, of the proper length. There was a cover on that box, and a small strip of glass, running nearly the whole length of the box, so that you could see only the space of one figure. If it is necessary, I have some parts of the instruments at the shop, that will illustrate it better than I can tell it.

I can hardly tell you when it was made. I could ascertain that by asking the gentleman who got me to make it—somewhere between 1873 and 1875, or before that. I don't know what became of it. It became lost. This party had taken it and tried it. There was a Company raised for the purpose of introducing, or putting out, his machine for weighing or measuring grain. The way I understood, the Company fell to pieces—never amounted to anything, and he never used it, and it came back into my possession.

Cross-Q. 1127. What was the name of the party for whom you made that medicine?

[*Same objection.*]

A. Abraham Hamaker, a brother of the one who has the drug store out here in Market street.

Cross-Q. 1128. Mr. Zacharias, one of the Defendants' witnesses, on page 60 [57] of the record, speaks of a gas governor, which you invented. When did you make that invention, what was it, and what became of it?

[*Same objection.*]

A. I made one, yes sir. That would be hard for me to say. That was at an early time. That was before I went to that shop where I am now, but what year I don't remember. It might have been about 1860, 1862, 1863, perhaps later, or perhaps a little earlier; but I made several the first year or two after I went down to that shop, for the purpose of having them tried.

It was an arrangement to register or equalize the pressure of gas. It was intended to be applied to the meter, which the consumer would have in his possession. I mean on his premises. I have parts of the several instruments lying about the shop now.

Cross-Q. 1129. For whom did you make these, or who had them for trial?

[*Same objection.*]

A. The first one I made was for trial—a very rough apparatus. I made the second more complete, in order to show it to the Drawbaugh Pump Company, for the purpose of illustrating it to them, for the purpose of getting them to take an interest in it. There were some inquiries made about the machine, and it was found that the Gas Company would not allow it to be attached to the meter. I guess for that reason there was nothing done. They didn't take an interest in it.

Cross-Q. 1130. In your answer to the 806th interrogatory, you mention that you did some work for William Morris, who lived at Bridgeport. What was the work you did for him?

[*Same objection.*]

A. I experimented for him in order to get up an arrangement for pressing or stamping lamp shades.

Cross-Q. 1131. Can you tell when you did that work, and what you got for it?

[*Same objection.*]

A. I couldn't, exactly. I could find out, though. I never got anything for making it. I had asked him for money several times, and he didn't have any, and after that he died. I may have got a few dollars on the bill. I don't remember, but I may have.

Cross-Q. 1132. Did you get up a stamp canceller at one time? If so, for whom, and at what time?

[*Same objection.*]

A. I did; for one Mr. Stees, who lived in Harrisburg. He intended to pay me for my time, and to pay all expenses of patenting it. He went and consulted Mr. Cameron about it, and showed him a stamp that I had made. Mr. Stees had it in his possession a long time, and seen Mr. Cameron a number of times. He told me that it would cost too much to introduce it—to get the government to take hold of it. That was at an early period. It was some time after the war. It was made before I went into that shop.

Cross-Q. 1133. Did you get up some inventions for Mr. S. M. Hertzler at one time? If so, what were they, and how much did he pay you for them, and when was it?

[*Same objection.*]

A. Yes, sir; a machine for stemming grapes. I don't remember what he paid me. I could hardly tell when that was. It was about 1871. It might have been a little earlier, or it might have been a little later.

Cross-Q. 1134. Did you get up a machine, at any time, for a Mr. Patton, at Harrisburg, for stamping metal? If so, what was the machine, when did you make it, and what did you get for it?

[*Same objection.*]

A. Yes, sir; it was for making carpet tacks. That was about the closing of the war, or it may have been before the closing of the war. I don't remember rightly; I think I got four hundred dollars for the machine, and afterwards they paid me fifty dollars for a second set of dies, for a different shaped tack. The money I had a good deal of bother getting hold of; it was paid by instalments.

Adjourned until Jan. 26, 1882, at ten, A. M.

Jan. 26, 1882, 11:15, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued.

Cross-Q. 1135. You said yesterday that Mr. Abraham Hamaker, the man for whom you got up the counting machine, resides now in Harrisburg. Where did he reside at the time you got up the machine, and what was his business?

[*Same objection.*]

A. I think he resided at that time in the city here; I don't know what his business was; I only know he was experimenting on the machine.

LEPHONE COMPANY,-2

Cross-Q. 1136. Had he ever lived near to you?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1137. When was that and how long?

[*Same objection.*]

A. I don't know when he left there—he lived there three or four years, as near as I can recollect.

Cross-Q. 1138. What was his business when he lived there?

[*Same objection.*]

A. He was working in the mill; I don't know whether he counted himself a miller or not; it was then called Teahl's mill; it was a flouring mill.

Cross-Q. 1139. You mention speaking to Mr. Simon Oyster about taking an interest in yonr talking machine. Where did he reside at the time you spoke to him, what was his business and was he then a man of property?

[*Same objection.*]

A. He lived at New Cumberland. When I spoke to him about it, I met him here at Harrisburg. His father had been in the lumber business. He was then traveling with lightning rods; I suppose that was what led to a conversation on electricity. I always considered him wealthy.

Cross-Q. 1140. Did you at one time invent or construct a machine for making paper bags? If so, for whom, at what time, and what was done with it?

[*Same objection.*]

A. I did; I worked or experimented on the machine, but didn't fully complete it; it was a very temporary machine: it was for Henry Singiser. I spoke to him about taking an interest in some of my arrangements,—that is, in the telephone, particularly; he told me that there was something else that would be very valuable to be gotton up; he was then manufacturing paper bags at Mechanicsburg; that was during the spring or summer of 1876. The machine was partly made and dropped; he never went into it. As far as folding—that, I had it completed—folding bags; but it was intended to finish—fold and paste.

Cross-Q. 1141. Did you have any arrangement or understanding with him about that invention before you commenced work on it? If so, what was it?

[*Same objection.*]

A. I don't remember what. There was an arrangement; I was to get up a machine and he would get, if I am not mistaken, one half of the patent. I don't know whether there was anything mentioned that he was to pay expenses or not, but that was my idea, or my impression while I was working on it—that he was to furnish the pay for my time; because I know I needed money very bad at the time.

Cross-Q. 1142. Did he furnish you the materials for making your experiments or with money for obtaining them?

[*Same objection.*]

A. No, sir; to the best of my recollection he didn't. It was very simple; it was made of pine boards; I don't suppose all the material in it would cost over a dollar or a dollar and a half; the time was more than the material, a good deal.

Cross-Q. 1143. What was the reason that the machine was not completed and put in operation?

[*Same objection.*]

A. I can't say; though at a time after that, I can't say how long, he he was unfortunate—he failed; his machinery was sold.

Cross-Q. 1144. Did you get up any machinery for the Axle Company while they occupied the shop? If so, what was it?

[*Same objection.*]

A. I did. I can hardly remember. There were different machines; I will have to reflect a little; there was none of them very complicated. The most of them were in the way of tools—reamers and such things, adapted for boring boxes for axles; two machines for finishing the part of the axle that was called the cone; that is, for finishing the inside of an adjustable cone; we termed it a drifting tool. Another was an application of a device placed on a lathe, for adjusting the tool for that part of the axle, which was called the cone on the spindle.

Cross-Q. 1145. Were any of those machines or tools adapted for cutting square holes?

[*Same objection.*]

A. That drifting tool was adapted for that purpose.

Cross-Q. 1146. I think you referred, page 931, [895,] to a machine for knotting carpet rags. What kind of a machine was that, when was it got up, and what was done with it?

[*Same objection.*]

A. I will have to describe it by a sketch. It was termed a carpet-rag needle. It was composed of a thin blade of steel, with an opening through the blade towards the upper end. There were small teeth in the upper part of the opening. The lower end was provided with a small wood screw, which was attached to the blade by solder. The upper end of the blade was harpoon-shaped, ground to an edge; that is as near as I can describe it. I don't remember when it was got up. It was at a pretty early time. I might get at the date by referring to some parties who had bought them and sold some of them. I have got some of them yet.

Cross-Q. 1147. Who were the parties who bought and sold them?

[*Same objection.*]

A. I don't remember all; one Abraham Ditlow was one; another was Joseph Ditlow,—Johnson Leonard. There were some others that I don't remember.

Cross-Q. 1148. What was the business of those parties whom you have named, at the time they bought and sold these machines?

[*Same objection.*]

A. I don't know that they had any particular business. They were not doing much—either of those parties; the Ditlow boys—their business, in the winter season, sometimes, was trapping.

Cross-Q. 1149. Did you ever invent a stethoscope; if so, for whom, and at what time?

[*Same objection.*]

A. We had part of it here, connected to a telephone—instrument "P"; the rubber tube with the coiled spring in it, and the ear-piece are parts of the stethoscope. It required two ear-pieces. I intended it to be part of the telephone, and discovered afterwards that it would do for a stethoscope.

Cross-Q. 1150. In reference to your solar transit, I find in the interference record, to which reference has been made, on page 61, in answer to cross-interrogatory 115, this statement in your deposition; you were asked, "*How often did you make those observations?*" referring to observations of the sun, and you said, "*I cannot positively say how* *often, but think that time I made observations every day; after that, every week, for a time; then there was a time when I made observations every two weeks. Them observations were cantinued, to the best of my knowledge, six or eight months, or perhaps one year.*" Is that in accordance with your recollection at that time?

[*Same objection.*]

A. Yes; I don't positively know how long. I approximated, or guessed, at the time.

Cross-Q. 1151. What was the object of those continued observations?

[*Same objection.*]

A. To try, or test, the proper time of a clock that I was then timing.

Cross-Q. 1152. One of your magnetic clocks, I suppose?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1153. Do you remember which one?

[*Same objection.*]

A. No, I don't exactly; I remember at the time, it didn't have any case. It wasn't the one I had given to Shapley. It was one that had no finished case. It was in part of a case, though, without any front cover.

Cross-Q. 1154. One of the witnesses in the interference case, to which I have referred, is named John C. Smith. Is he the same John C. Smith who has been called by the Defendants as a witness?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1155. On page 121 of the interference record, in answer to interrogatory 3, he states, that in the summer of 1877, he was in Daniel Drawbaugh's shop, working at a small stationary engine for himself. Do you remember his working on that engine?

[*Same objection.*]

A. Yes, sir; I remember he was working on an engine, but I didn't remember the time. He had been working on it for quite a while, but don't remember any particular period.

Cross-Q. 1156. How long a time, in all, should you think he worked on it in that shop?

[*Same objection.*]

A. I don't know how long. My idea would be, it was more than a year he was working on it, off and on. It may have been more.

Cross-Q. 1157. You have spoken of the pump, which was constructed under your first faucet patent. Did you invent or construct any other kinds of pumps?

[*Same objection.*]

A. I worked on a different kind of pump, yes, sir. I didn't claim it as a particular invention. It was composed of an iron stock, to be placed on to the bed of the well, or cistern, and connected by iron tubing, or gas pipe, of some kind; through that was a rod, that was connected to the handle of the pump, and the opposite end fastened to a piston, similar to other pumps.

Cross-Q. 1158. When did you work on this pump, and how much?

[*Same objection.*]

A. I don't remember when I made the first one. It might have been as far back as 1868 or 1869. The number I don't remember. I could tell by a little reflection. I didn't make many—four, that I remember of.

Cross-Q. 1159. Were these made while the Faucet Company occupied the shop?

[*Same objection.*]

A. The first one or two were. The last one was made, perhaps a year and a half ago.

Cross-Q. 1160. Did you get up any other pump of any kind?

[*Same objection.*]

A. Not that I can remember of now.

Cross-Q. 1161. Did you ever get up, and manufacture, a syphon pump, or steam pump, of any kind? If so, state what it is.

[*Same objection.*]

A. Yes, I forgot about that. I got up a set of patterns for Mr. Stevenson, and I manufactured a few. I don't remember how many.

Cross-Q. 1162. When was it that you manufactured those steam pumps, and were they pumps of your own invention, or did they embrace any invention of yours?

[*Same objection.*]

A. These that I manufactured for Stevenson, I don't remember the time. I manufactured some of them during the time that Mr. Chellis took charge of the shop. Part of it was on a principle that I got up the model of one—quite a number of years ago. I didn't call it a pump then—a device for supplying steam boilers with water.

Cross-Q. 1163. Did you make any of those pumps for Mr. Stevenson, before Mr. Chellis took hold of the business, and if so, how long before?

[*Same objection.*]

A. Yes, sir; I don't remember how long. It might have been a year or two.

Cross-Q. 1164. Where does Mr. Stevenson reside, or carry on business, and how long have you been accustoned to deal with him in any way?

[*Same objection.*]

A. He resides in Harrisburg. He has got a machine supply store there. I have been accustomed to deal with him quite a number of years. The old Faucet Company had some of their work made in his shop, during the time that he run a shop here in Harrisburg. That was prior to the time that they run the shop that I am now in.

Cross-Q. 1165. What other dealings have you had with Mr. Stevenson, since that time, besides what related to pumps?

[*Same objection.*]

A. I don't remember any particular dealings. I had manufactured some small arrangements, that he termed a flue cleaner; I had made and changed some of the patterns on those machines for him, and he furnished the materials; he also furnished the materials for those syphon pumps. There may have been some other dealings; I don't remember.

Cross-Q. 1166. Did you make any of those pumps for other parties than Mr. Stevenson?

[*Same objection.*]

A. I made one for Ahl & Brother.

Cross-Q. 1167. When was that?

[*Same objection.*]

A. As near as I can remember, two years ago, perhaps.

Cross-Q. 1168. When did you get up the model for the boiler feeder, to which you have referred?

[*Same objection.*]

A. That is so long that I couldn't tell within five or six years, maybe more; it was a number of years before the starting of the Rebellion—before the war.

Cross-Q. 1169. You invented, I believe, a second faucet, which was the subject of the interference between you and Mr. Hauck; were you working on that invention after the first Faucet Company was formed, down to the time when Mr. Chellis first took hold of it?

[*Same objection.*]

A. Not working on it all the time. I had made a machine, that I termed a pressure blower; and, some time after that, I don't remember the length of time, I made a wooden machine on nearly the same principle as the faucet, that Mr. Chellis has an interest in.

Cross-Q. 1170. Who was occupying the shop, when you made the blower, and when you made the wooden machines, to which you refer?

[*Same objection.*]

A. The old Faucet Company.

Cross-Q. 1171. Were you working on this second faucet in 1877?

[*Same objection.*]

A. I don't remember the periods exactly; I worked at it at different times.

Cross-Q. 1172. Do you recollect testifying in the interference case, relating to that invention, that you made your first model in the year 1870?

[*Same objection.*]

A. I don't remember the period—it was at an early period that I made the blower, and not a great while after that, I made this wooden model of the faucet; I am aware that I testified in regard to the making of these models.

Cross-Q. 1173. I read from your testimony in the interference record, page 8, the 27th question and answer. "*According to the best of your recollection, in what year did you make that model? Answer. In the year* 1870, *to the best of my knowledge.*" Was that statement correct and did it relate to the first model?

[*Same objection.*]

A. I suppose it did; as I said now, I might have then reflected on it, and knowed the time by circumstances; I can't now name the year.

Cross-Q. 1174. I read your two questions, and the answers, on page

10, of the interference record, from your deposition. "*Question* 45. *Subsequent to* 1870, *did you make any further experiments upon the faucet, with a view to perfect it? Answer. Yes, sir; I made another model; the construction was about similar to this one of* 1870; *the difference being, that there were no semi-circular guides for the dividing plate; the dividing plate merely passed through the wall of the case, into a small chamber, something similar to the one in the model now before me, marked 'C. D. C. M.'*

Question 46. *When did you make that second model? Answer. About two years, or a little more, after I made the first one.*"

Were those answers correct?

[*Same objection.*]

A. Yes, sir; I am satisfied they were; they were then, to the best of my recollection; I am certain of that.

Cross-Q. 1175. I read from page 11, of your deposition in that case, the 50th interrogatory and answer. "*Returning to the third model spoken of, when was it made? Ans. I cannot give the exact date; I made it, to the best of my knowledge, about* 1877—*in that year.*"

Is that correct?

[*Same objection.*]

A. Yes, sir; that is one that my brother had intended to take an interest in, and I think, a gentleman that is residing in Harrisburg. I forget his name now.

Cross-Q. 1176. What more did you do, on that faucet, before you made your arrangements with Dr. Moffitt and Mr. Chellis to take an interest in the invention?

[*Same objection.*]

A. I made another model.

Cross-Q. 1177. When was that?

[*Same objection.*]

A. I don't remember now; I must reflect a little, and then I can get at it pretty near; I guess it was some time in 1878, as near as I can remember.

Cross-Q. 1178. Was it while the Clock Company was carrying on the business?

[*Same objection.*]

A. Yes, I think it was. William C. Diven was the man who thought of taking an interest in the faucet—the one that I think I made in 1877, as near as I can remember.

Cross-Q. 1179. What was the character of your arrangements with Chellis and Moffitt, about that invention?

[*Same objection.*]

A. They were to pay all expenses, and each one was to have one third interest. They paid me, at the time that we closed the bargain, two hundred or two hundred and fifty dollars; I don't remember the amount; though, providing the faucet was not patented, they held me for the two hundred and fifty dollars, or the amount that they paid me.

Cross-Q. 1180. In your answer to the 170th direct interrogatory, on page 809 [777] of the printed record, referring to the wagon you painted for Jacob Sadler, you said it had a hydraulic ram on the sides of the wagon; what was the reason for that?

[*Same objection.*]

A. It was an ornament, or a portion of the painting of the wagon; the wagon was designed for hauling out the rams and pipe.

Cross-Q. 1181. What rams and pipe?

[*Same objection.*]

A. The ram that I had made there in the shop.

Cross-Q. 1182. Was that a ram of your own invention, or containing any invention of yours?

[*Same objection.*]

A. Partly.

Cross-Q. 1183. What was it?

[*Same objection.*]

A. The difference between the ordinary ram and this was, that, at the upper portion, where the puppet valve worked, above its surface, and at the side of the seat, is a raised projection in the body that carries the valve, for holding air, which facilitates the movement of the valve; that is, when the momentum of the water ceases, it produces a reaction, which forms a partial vacuum The air that is contained in there has a tendency to bring the valve back from its seat. When that goes back it receives a new supply of air. A portion of that air passes into the air-chamber, on the next impulse of the water, for the purpose of keeping the air-chamber supplied with air, which is necessary for a hydraulic ram to work satisfactorily.

Cross-Q. 1184. Were you, at that time, engaged in the manufacture and sale of those rams, and in putting them up for people about the country?

[*Same objection.*]

A. Yes, sir; to some extent.

Cross-Q. 1185. Did you employ Mr. Sadler to carry them out to customers?

[*Same objection.*]

A. I didn't employ him, no, sir; he took an interest and furnished the money to run the business. He furnished a team and wagon and bought a lot of pipe and fittings.

Recess for dinner until 2 o'clock, P. M.

Jan. 26, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 1186. What was the arrangement you had with Mr. Sadler; what interest did he have in the business?

[*Same objection.*]

A. I don't remember what arrangement any more. I was to be paid for what time I put in, and he would be allowed for what portion he would put in, and the balance would be equally divided, and the profits were to be equally divided, to the best of my recollection. I don't remember exactly.

Cross-Q. 1187. How long did this arrangement continue, or how long was he interested in the business?

[*Same objection.*]

A. I don't remember how long. It wasn't very long. I don't think it continued one summer. I think not; not more than one season.

Cross-Q. 1188. Did any other party at any time have an interest in this business? If so, who was it, when, and how long did it continue?

[*Same objection.*]

A. A. H. Gardner had an interest for a short time. I don't remember the length of time. I think it was before the arrangement with Sadler.

Cross-Q. 1189. What was your arrangement with him in reference to the business?

[*Same objection.*]

A. As near as I can remember it was about the same. I don't remember the particulars about the arrangement.

Cross-Q. 1190. You built the rams at the shop I suppose; did you help to set them up?

[*Same objection.*]

A. I helped to set them up, yes, sir.

Cross-Q. 1191. What did Gardner and Sadler do?

[*Same objection.*]

A. They helped to set them up. Gardner, when he was in, seen the parties and made contracts,—that is, for two or three.

Cross-Q. 1192. What price was charged for the pumps separate from the pipe that was required?

[*Same objection.*]

A. There were three prices; that is, for three sizes. The largest, I think, was twenty dollars. The next was fifteen, and the next, smaller than that, was eleven dollars.

Cross-Q. 1193. Did you charge for setting up the pumps in addition to their price and the price of the pipe?

[*Same objection.*]

A. Yes, in some cases we did. I don't know whether we did in all.

Cross-Q. 1194. How much did you charge for the pipe above what it cost you; what percentage?

[*Same objection.*]

A. That would be different. Parties who would sell the pipe would send the retail price list, and the percentage, allowed on the pipe, would be different, at different times.

Sometimes it would be 35, 40, 45; sometimes as high as 50 per cent. off.

Cross-Q. 1195. That is, you bought pipe at a discount from the retail price of the parties selling it, and you sold it to your customers at the retail price of the manufacturers?

[*Same objection.*]

A. Yes, sir; of the manufacturers.

Cross-Q. 1196. Of whom did you buy the pipe?

[*Same objection.*]

A. I don't remember all the different parties. I remember one or two. I could ascertain in the morning from bills that I have. One is Morris, Tasker & Co., of Philadelphia, I think.

Cross-Q. 1197. Can you give me the names of the parties to whom you sold rams and pipe?

[*Same objection.*]

A. Henry Herr was one. That was sold to him by Gardner and myself, when we had it. Another man was Trimmer. I don't remember his first name. He lived in Adams county. I think those were all that Gardner and I put in, while we were together. Another one I put in for William Stephen, at a very early date. Then it was replaced with another ram, at or near the time when Mr. Sadler went in. I put one in for Mr. John T. Smith. Another one I think of now, that Mr. Gardner and I put in, for a gentleman named Brand. His first name I don't remember. That is all that I can remember now. There may be some others that I don't think of.

Cross-Q. 1198. Have you any means of ascertaining the names of all the parties to whom you sold rams and the price which they paid?

[*Same objection.*]

A. I don't know; some of the bills and accounts of them have been lost; but, if I was to reflect over it awhile, I might.

Cross-Q. 1199. Do you remember the price you got for Trimmer's rams?

[*Same objection.*]

A. I don't remember the price.

Cross-Q. 1200. Have you ascertained the amount which you received from Mr. Eberly and Mr. Croll and Gardner, of which I enquired at an early period in the cross-examination, page 916, [881,] answer 718; if so, will you state what it is?

[*Same objection.*]

A. I did from Mr. Eberly, from the account in his books; I will just read them off.

(*Further answer objected to by Mr. Hill as secondary and hearsay*)

Mr. Jacobs and I called on Mr. Eberly and he showed his books, and referred to the charges; the first charge of C. Eberly against me is February 5, 1849.

July 12, 1864, a balance against me	$271.12
From this time to the close of the year 1864 I fell further in his debt,	112.48
In the year 1865 I got from him flour, feed, etc.,	96.82
In the year 1866 flour, feed, meat, etc.,	86.06
1867 to March 28 he charges,	21.73
That is as far as Mr. Eberly's bill runs.	
In addition to the above there are charges for meat in 1863 and 1864,	43.46
Meat bill of 1865,	1.43
On the 26th of December there appears a charge against me of	398.71

In January, 1861, he started a new book, and he does not seem to have carried it over.

That is all; I did not see Mr. Gardner or Mr. Croll; I did not have time.

Cross-Q. 1201. Was Mr. Jacobs with you when you obtained this information from Mr. Eberly?

A. Yes, sir.

Cross-Q. 1202. And were those the charges which were squared between you and Mr. Eberly as stated in your answer to the cross-interrogatory 716?

A. There appears to be no settlement; we spoke of a settlement, and he showed me what I owed him, and I said I had no money—I don't remember the language; he said he knew I had no money, and that we would call it square, but it never was squared in his books; I was under the impression that we had settled it.

Cross-Q. 1203. Has he ever called on you to pay the balance, which appeared then to be due from you?

A. I guess he has, yes, sir, at a later time; I don't remember the time exactly; it was during the time the Axle Company was running the shop. Mr. Eberly had become in middling straitened circumstances; he was partly broken up; and I had been using his turning lathe for a number of years, and I paid him for it, and not on the old account. I think the money was paid by the Axle Company, or was paid out of money I got from the Axle Company.

Cross-Q. 1204. In the answer, to the 716th cross-interrogatory, which I have read to you, you say that Mr. Eberly said, "We will square accounts;" "I owed him several hundred dollars, to the best of my recollection." Now, what I want to know, is, whether Mr. Eberly ever called upon you to pay the balance, which was due at that time, and which he said he would square?

A. That I don't remember; very likely he did call on me; I don't doubt but that he did; I don't positively remember if he did; I would certainly say so, if I would remember of him calling on me.

Cross-Q. 1205. Did Mr. Eberly's book which you examined contain credits to you for all the work you had done for him during the period covered by these accounts?

A. No, I don't think they do; there was some credits in; I didn't take any account of the credits; them were charges, that I had reference to.

Cross-Q. 1206. In your answer to the 717th cross-interrogatory, you say, that when Mr. Eberly said you would square accounts, may have been in 1865, 1866 or 1867, and in your next answer, you said, you would try to ascertain when that settlement actually was; have you done so?

A. I was under the impression that we had a settlement; his book don't show any settlement; I knowed he spoke of a settlement, and my impression was, there was a settlement; I told him I didn't have any money; he said he would square accounts, or something to that amount; I can't remember the language.

Cross-Q. 1207. Do you remember a suit that was brought by Lee & Bayler against you and Fettrow to enforce a lien for lumber which you purchased of them and sold to Fettrow?

A. It was a suit brought against me, I remember.

Cross-Q. 1208. Do you remember another suit that was brought against you by Mr. Mosser, attorney-in-fact for Lee & Bayler, in 1879, before H. M. Rupley, Justice of the Peace, to collect a balance of account?

A. My impression is that it was only one suit. I don't remember of two suits.

Cross-Q. 1209. Do you remember judgment being obtained before Mr. Rupley in that suit, and that you appealed it?

A. Yes, sir; I put in a bill, or offset, against their account, and Mr. Lee plead the limitation on my bill. That was on the day we appeared at Mr. Rupley's—the day of hearing.

Cross-Q. 1210. What was the account which you set up in offset?

A. The account extended a good while. I had been doing their repairs at the mill for a number of years. The first was Eberly, and Frank Lee; then the firm changed to Eberly and John Lee. At one time it was John Lee alone, then Lee and Bayler. It always had been arranged that when one party went out, the other party agreed to pay the outstanding bills. They had told me that was the arrangement.

Cross-Q. 1211. You claimed, if I understand you, that taking the accounts between you and the successive parties you have mentioned, for the whole period, there was no balance against you at the time the suit was brought, or a very small balance, if any.

[*Same objection.*]

A. I won't say that. I didn't know. I thought there would be a balance, but I wasn't sure.

Cross-Q. 1212. Will you look at the affidavit, a copy of which I find in the records which have been produced by the Defendants, ("Exhibit Drawbaugh Judgments,") and which I will read as follows:

"Copy of affidavit of defense.

John F. Lee & Henry Bayler, trading as Lee & Bayler, vs. Daniel Fettrow, owner or reputed owner, & Daniel Drawbaugh, contractor.	In the Court of Common Pleas of Cumberland County, No. 201, Nov. T. 1878.

Before me, M. F. Thompson, Dep'y Proth'y of the Court of Common Pleas of Cumberland County, personally appeared Daniel Drawbaugh, one of the Defendants above named, who, being duly sworn according to law, doth depose and say, that he has a just and legal defense to the whole of the Plaintiff's demand in the above suit, the nature and character of which is, that for a period of years, he, the said Daniel Drawbaugh, had been doing skilled labor for Plaintiffs in above, to the amount of in the neighborhood of two hundred & sixty dollars, that the lumber was bought on the faith & credit of the indebtedness of Plaintiffs to Defendant; that he is prepared to settle with Plaintiffs and, if he owes them anything, is prepared to pay the same & further saith not.

Affirmed & subscribed before me this 31 day of October, 1878. M. F. THOMPSON, Depy. Prothy.	DANIEL DRAWBAUGH."

Does that affidavit state what you understood to be the true situation of accounts between you and the parties at that time?

A. Yes sir; as far as that I knowed I had this bill against them, and I knowed they had a bill against me, but I thought my bill was more than theirs, and I did this for the purpose of getting my money.

Cross-Q. 1213. You mean that you bought the lumber which you let Fettrow have for the sake of getting the balance which you thought was due you?

A. Yes; because I had heard that Mr. Lee didn't intend to pay the bills contracted by the former firms; that is, it was reported.

Cross-Q. 1214. Do you remember the amount which you got from Mr. Fettrow that you thought would square the balance?

A. I don't remember now. I could ascertain the amount if it is necessary.

Cross-Q. 1215. Did Mr. Fettrow pay you for the lumber?

A. Yes, sir; that is, we settled it through some settlements that we had.

Cross-Q. 1216. Will you examine the affidavit which I now read to you as follows:

"H. R. Mosser, att'y in fact for
Lee & Bayler
vs.
Daniel Drawbaugh.
} Appeal from judg't of H. M. Rupley, Esq., J. P.

State of Pennsylvania,
County of Cumberland.
} ss.

Personally appeared before me, R. M. Graham, Proth'y for the County aforesaid, Dan'l Drawbaugh, who, being duly sworn, says that he has a just and legal defense to nearly all of the plaintiff's demand in above stated appeal, the nature and character of which is as follows, to wit:

1st. A mechanic's lien has been filed against Dan'l Fettrow, owner or reputed owner, and Dan'l Drawbaugh, contractor, to No. 201 November Term, 1878, and a Sci. Fa. issued thereon for the same claim, on which the above judgment was rendered and a non-suit offered thereon in open Court.

2d. Daniel Drawbaugh, the above-named Def't, is a machinist by trade, and as such was employed to do work for Eberly & Lee, the predecessors of Lee & Bayler, by repairing machinery and engine in the saw-mill of Plffs., said skilled labor commencing the 17th day of February, 1866, and ending on the 25th day of May, 1876, during which period he did work which aggregated five hundred and ninety dollars, on which said amount he claims interest from six months after last work ordered for Eberly & Lee, John Lee, and Lee & Bayler.

That there was a running account with the various firms above named, from Feb. 7th, 1866, to the 25th day of May, 1876, with a distinct understanding between Deft. above named and the Plff's above named, that they, the Plff's, would pay him, the Deft., for work done for the firms of Lee & Eberly and John F. Lee. That the Deft. was apprised of the contemplated dissolution of the co-partnership between Lee & Bayler, and went to them and bought lumber to save his claim for work done. Plff's did not hesitate to furnish said lumber on the faith and credit of their firms and the firms Lee & Eberly and John F. Lee's indebtedness, with the further understanding that a settlement of all claims between them should be made in the spring following. That Plff. believes, upon a just and equitable settlement of all matters in dispute between them, he, the Deft., would be indebted to the Plff's in the sum of from $16.00 to $20 00, which amount he is now prepared to pay. That he does not file this appeal for the purpose of delay, but that he verily believes that injustice would be done him if the judgment of the justice should be permitted to stand; and further said not.

Daniel Drawbaugh.

Sworn and subscribed be-
fore me the first day of March,
A. D. 1880.
R. M. Graham, Proth'y."

and state whether you remember making it upon the appeal of that suit?

A. I do remember making it, but I had forgotten it. It was prepared by an attorney whom I had employed to defend the case.

Cross-Q. 1217. That affidavit, I suppose, correctly expresses what you understood to be the relations between the parties and your reasons for making the final purchase of lumber which Fettrow had?

A. Yes, sir; that is, I made a statement to the attorney of the nature of the case, and he drawed that up. Legal papers I don't understand as I should, perhaps.

[*Plaintiff's counsel now offers in evidence a certified copy of the account which was the cause of action, and upon which judgment was rendered Feb. 7th,* 1880, *in the suit Mosser, att'y-in-fact of Lee & Bayler, against Daniel Drawbaugh, before H. M. Rupley, Esq., Justice, to be marked "Exhibit Mosser Claim."*

The charges in said account extend from April 25, 1873, to Feb. 28, 1877, and amount to	$132.65
1876, August 25, Cr. by bills to date,	71.92
	$60.73
Interest,	10.67
	$71.40]

Cross-Q. 1218. Will you look at the accounts which I now hand you, and state whether they are accounts which you rendered from time to time to Eberly & Lee, John F. Lee, and Lee & Bayler?

A. Yes, sir; them are bills that I presented to them. At what time I don't remember.

[*Counsel for Plaintiffs offer the above-mentioned bills in evidence, to be marked "Drawbaugh's Bills for Repairs done for Eberly & Lee, John F. Lee, and Lee & Bayler." The bills are five in number.*

The amount and dates are as follows:

Eberly and Lee, Fed., 1866, to June, 1870,		$46.47
John F. Lee, Sept. 1870 to Sept. 1872,		52.42
" " Jan. 1873 " April, 1873,		21.25
Lee and Bayler, April, 1873 to March, 1875,	$56.97	
" " April, 1875 to May, 1876,	14.95	
		71 92
		$192.06)

[*By consent, copies of said bills are put in evidence, the originats to be produced when called for, said copies to be subject to all legal objections which could be made to the original.*]

Cross-Q. 1219. Will you look at the two accounts which I now hand you and say whether they are the accounts which John F. Lee, and Lee & Eberly rendered you?

A. I suppose they would be correct bills. I don't remember the amounts of the bills.

[*By consent, the following copies of said bills are put in evidence, the original to be produced when called for. Said copies to be subject to all legal objections which could be made to the originals.*]

[Defendants' counsel objects to the introduction by Complainants of the papers purporting to be accounts, and statements of accounts, between Daniel Drawbaugh and Lee & Eberly, John F. Lee and Lee & Bayler, and to the affidavits and other papers, introduced by Complainants, relating to the suits above mentioned; and to the cross-examintion of the witness thereupon, for any purpose except to show the amonnt of money received by Daniel Drawbaugh at different times, or the amount of his indebtedness, at different times, or as bearing on said qnestions of the receipt of money, or indebtedness, or his financial condition, said evidence being, for all other purposes, immateral, irrelevant and incompetent, and improper on cross-examination. This objection is made to all the cross-examination, which has been going on, up to this point, on those subjects, and to all that may follow.]

Cross-Q. 1220. Will you look at Lee & Eberly's account and state whether the lumber, which is charged you in 1868, was the lumber which you used in repairing your house after you purchased it?

A. It is very likely this is the bill. I guess that is the bill. I would suppose it to be.

[Counsel for complainants calls attention to the fact that in "Exhibit Drawbaugh Judgment," the copy from the record in Mechanics' Lien 1006, *Lee & Bayler* vs. *Fettrow and Drawbaugh, the claim refers to "bill annexed," but no bill is annexed.]*

[By consent a copy of said bill annexed is put in from another transcript, and marked "Lee & Bayler's Bill Annexed."]

Cross-Q. 1221. Do you remember, while the Axle Company occupied the shop that you now occupy, that there was an interference between Frederick W. Wild and Jacob Kline on the axles which they manufactured, in which you testified as a witness on behalf of Mr. Kline?

A. Yes, sir; I remember of Kline having an interference with some person. I had forgotten the other parties name—I remember that I testified.

Cross-Q. 1222. Do you remember that Mr. Theophilus Weaver was Mr. Kline's counsel in that proceeding?

A. Yes, sir.

Cross-Q. 1223. Had you known him before that?

A. Yes, sir.

Cross-Q. 1224. It appears by the caption of the deposition in that interference, in the printed record which I have, that they were taken at the office of D. C. Maurer, in Harrisburg, No. 200 Walnut street, on the 26th day of October, 1875. Do you remember whether that was the time and place?

A. I don't remember the time; I remember the place.

Cross-Q. 1225. Will you look at what purports to be your deposition, on the forty-first and forty-second pages of that printed record, and state whether you remember testifying as there stated?

[*Objected to by Mr. Hill, as new matter not referred to in the direct examination, and as irrelevant and immaterial.*]

A. Yes, sir; I remember by reading over it now. I couldn't remember just everything I said then.

Cross-Q. 1226. Do you remember making the model and doing the other work mentioned in that deposition?

A. I remember it from charges in an account that I had. I remember, too, of making work for him of that nature.

[*Counsel for Complainants offer said deposition in evidence, to be marked "D. Drawbaugh deposition in axle case."*]

[*Counsel for Defendants inquires for what purpose this last-mentioned exhibit is offered in evidence on cross-examination.*]

[*Counsel for the Complainant replies that he introduces it to show, among other things, the witness' occupation as a model maker.*]

[*Defendants' counsel says that that has been abundantly proved and never denied, and he objects to the introduction of the exhibit as new matter not referred to in the direct examination, and as immaterial, irrelevant, and incompetent.*]

DANIEL DRAWBAUGH.

Adjourned until Jan. 27, 1882, at ten, A. M.

Jan. 27, 1882, at ten, A. M.

Examination adjourned by consent until February 13, 1882, at 2, P. M.

February 13, 1882, 3, P. M.

Examination resumed pursuant to adjournment.

Present, Mr. Smith and Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 1227. In your answer to the 87th interrogatory, you produced a sketch representing instrument "B," as you first made it, as I understand, where the armature of the electro-magnet is connected to a diaphragm on the tin tube by a string, and, in your answers to the 110th, 111th, and 112th interrogatories, you say that the board of exhibit "B" is not the same as that which you used when the instrument was in the form shown in "Drawbaugh sketch, No. 2," and I understood you to say the magrets are not the same, and that the tin tube may or may not be the same. Am I correct in my understanding of what you said about the electro-magnets?

A. I had a number of magnets. I ain't positive that they are the same. I had a number of magnets, and I am pretty positive that the magnet that is on now, isn't the same that was on when I used the string.

Cross-Q. 1228. Then, no part of the instrument represented by sketch No. 2 is to be found in exhibit "B" as produced, unless it may possibly be the tin tube?

A. I don't suppose there is any, and I ain't too positive that that is the same tube. The construction was the same, only. the string, and the armature suspended on a bracket.

Cross-Q. 1229. Did you dispense with the string; did you make an entirely new instrument, with the exception, possibly, of the tin tube, or did you simply alter the instrument, which you had previously had with the string?

A. That I don't remember; I made changes, as I said, in the magnets, and it would be likely that I took away the string and put the armature to the centre of the diaphragm, and moved the magnet up to the armature.

Cross-Q. 1230. After you dispensed with this string, did you ever go back to that form of instrument again?

A. I think not; I don't remember, but I think not.

Cross-Q. 1231. How many times did you change the electro-magnets on the instrument, after you dispensed with this string?

A. I don't remember how many times; I know I had different other magnets; the number I don't remember.

Cross-Q. 1232. Did you dispense with this string and put the instrument into the form shown by exhibit "B," before you constructed instrument "C?"

A. Yes, sir; I think so, but I don't remember exactly when it was; I think it was before.

Cross-Q. 1233. Have you any doubt about its being before?

A. I don't know that I have any doubts, but it would appear to me that I had omitted the string because when I constructed instrument "C," I didn't have any string connected with that one; I am positive that I had no string connected with instrument "C."

Cross-Q. 1234. Did you make any changes in the electro magnets on instrument "B," after you constructed instrument "C," and if so, how many times did you change it?

A. I don't think I did; I don't remember now of making changes after that.

Cross-Q. 1235. Did you continue to use instrument "B," after you had constructed instrument "C," and if so, how much and how long?

A. I don't remember that I used it; I may have used it some; I often showed it to parties, after I had those other instruments; how much I used it I don't remember.

Cross-Q. 1236. Will you mention the latest time when you remember using instrument "B?"

A. That would be a little hard for me to do; I don't remember; I may have used it in the way of showing it to parties, after I had better ones; I don't remember the last time; I may have used it—spoke through it—after I had other ones, to show the manner of the ones I had at an earlier period.

Cross-Q. 1237. In your answer to the 188th direct interrogatory, you say that you got better results with the instrument "C," when you used it with the tumbler instrument as the transmitter, than you had with any former receiver; (the former receivers being, as I understand it, exhibit "B" and the instrument which was used with a string); will you give me some idea how much better instrument "C" was than instrument "B," as a receiver?

A. I got louder results; that is, it was louder, because that was currents produced by the battery, and sometimes I had used magneto transmitters. When using magneto transmitters, they were not as loud.

Cross-Q. 1238. The 188th interrogatory inquired only what results you got with the tumbler instrument, which I understand is "F," and the instrument "C" as a receiver; now give me some idea how much louder or better, in any way, the results were, which you got with instrument "C," when used in connection with instrument "F," than you got when you used instrument "B" in connection with instrument "F?"

A. I couldn't tell you how much louder, but the results were better with "C;" I couldn't give any idea how much the difference was.

Cross-Q. 1239. Can you state whether the results with "C" were very much, or decidedly better than you got with "B?"

A. They were better, but, as I said before, I can't tell how much better; as near as I can remember now,—it has been a good while ago,—they may have been considerably better.

Cross-Q. 1240. Did you consider instrument "C" to be an improvement upon instrument "B," as a receiver?

A. I think so; it was made for that intention; I know it was better.

Cross-Q. 1241. What kind of a battery did you use, when using "F" and "B" together, and "F" and "C" together?

A. At some times I have used a small Daniell battery—a casing of copper with a porous cell; but the first batteries that I used were the old sulphate of copper batteries. Then I had used another battery, the Callaud battery, with a copper plate in the bottom of the vessel, and some inches above that, a zinc ring. It was one of those batteries. In using "C" I may have used the Callaud battery, but in the first experiments that I had, I know I used none but the sulphate of copper battery.

Cross-Q. 1242. When you used "F" and "B" together, I wish to know whether you used the so-called sulphate of copper battery, or a Daniell's battery?

A. I don't remember. I may have used both. When I first made my experiments, I had none but a sulphate of copper battery. Some years after that, I made a Daniell battery. I don't know what time exactly I made that.

Cross-Q. 1243. What were the dimensions of the sulphate of copper battery, and also of the Daniell battery, which you made?

A. The sulphate of copper battery--I will get at as near as I can the size of the vessel—was perhaps six inches long, and perhaps three or four inches in diameter. The zinc cylinder was, perhaps, two inches on the outside. That was connected at the top to a wooden support that insulated the zinc from the copper, and did not allow the lower end to come in contact with the bottom of the copper vessel. The Daniell battery had a copper vessel about four inches high and about three inches in diameter, with a flaring top. The vessel at the top was perforated with holes, above the flange; within that was a porous cell about four inches long, an inch and a half, perhaps, in diameter, in which was a zinc rod about six inches long. In the outer cell was a solution of sulphate of copper, kept up by crystals at the top of the cell, within the flaring mouth. Within the porous cell was a solution of sulphuric acid and water. A screw cup was attached to the copper vessel for the reception of a conducting wire, and a conducting wire to the zinc rod.

Cross-Q. 1244. Will you state now, to the best of your recollection, whether you used the Daniell's cell when using "F" and "B"?

A. I may have, but I don't remember just at what time.

Cross-Q. 1245. You say you may have. Do you mean by that to express a doubt as to having used a Daniell's cell in connection with "F" and "B"?

A. I may have; that is, at the latter portion, but I did not at the earlier experiments. I don't remember exactly when I got the Daniell's battery. I know I had used it in connection with some experiments, but just at what time I don't remember. I used other batteries. I may have used a Callaud battery.

Cross-Q. 1246. I wish you now to reflect, and not answer any question till you have reflected, and then tell me whether, or not, according to your best recollection, you did use the Daniell's battery, which you have described, in connection with "F" and "B"?

A. What is the use for me to reflect? I know if I reflected a month I couldn't get it any closer; I may have; it is very likely I did; what I meant by that is, I couldn't say positively and wouldn't like to state it.

Cross-Q. 1247. Do you recollect using "F" and "B" in connection with the sulphate of copper battery, which you have described?

A. Yes, sir; because that was the first battery I ever used. For that reason I am positive of that.

Cross-Q. 1248. Did you use it before you moved into the shop which you now occupy?

A. Yes, sir; for there is where I made the first battery that I remember of making; that is, in the shop in the lower part of the house I now live in.

Cross-Q. 1249. Do you remember using that sulphate of copper battery after you moved into the shop where you now are?

A. Yes, sir.

Cross-Q. 1250. How long, after you moved into that shop, did you continue to use that battery?

A. That I can't say. I couldn't give it. I might say one or two years, or perhaps three years.

Cross-Q. 1251. Do you think you used the sulphate of copper battery in connection with "F" and "B"?

A. Yes; I am sure I did.

Cross-Q. 1252. Did you use it in connection with "F" and "C"?

A. I don't remember, because that was made at a later time. I would rather think that I had used then a Daniell's battery, or I might have used a Callaud battery. I do not know how long I used these batteries, only I am positive of using, at my first experiments, a sulphate of copper battery.

Cross-Q. 1253. Will you give the dimensions of the Callaud battery?

A. It was made generally out of a part of a glass fruit jar—that is, I cut off the upper end of a glass fruit jar—about four inches in diameter and six or seven inches high, with a copper plate a little less than the inside diameter of the jar, placed in the bottom. To that was connected a conducting wire at the centre of the copper plate, and it passed out at the top of the jar. At the top I generally used three metallic brackets that hooped over the top of the jar. On the inside of the projecting parts of the brackets rested a zinc ring with a conducting wire running from the zinc ring out of the top of the jar. I had crystals of sulphate of copper placed on the copper plate, and water sufficient to cover the top of the zinc ring.

Cross-Q. 1254. Did you use any other batteries except the three which you have described?

A. I may have made some other modifications, but that is more later. I at one time made a small Grove battery.

Cross-Q. 1255. Did you commence using the Callaud battery after you had used the Daniell's battery?

A. Yes, sir.

Cross-Q. 1256. How long do you think you used the Daniell's battery before you used the Callaud battery?

A. That I can't say—how long I used either of the batteries. I may have used both kinds at the same time; because, in experimenting, sometimes, you think one battery is better than another. I know sometimes I thought the Daniell battery was better than the Callaud, and at other time I thought the Callaud was better.

Cross-Q. 1257. Do you remember using "F" and "B" with the Callaud battery?

ELEPHONE COMPANY,-2

A. I don't remember. I may have. If I would remember I would say. I am sure of that.

Cross-Q. 1258. Do you remember using it with "F" and "C?"

A. I don't remember that. It would be more likely that I would have, because that was later, and that was a later battery.

Cross-Q. 1259. When using either of these three batteries, with either "F" and "B," or "F" and "C," did you use more than one cell at a time?

A. I don't remember of using more than one cell. I think, only one cell.

Cross-Q. 1260. How long is it since "F" and "B" have been in their present condition?

A. It has been a good while—quite a while—a number of years.

Cross-Q. 1261. Jacob Hawn, one of the witnesses produced by the defendants, speaks of seeing "F" and "B" (page 279 [267]) before May 27, 1872, and on page 282, [270] in answer to interrogatory 40, he says he thinks the instruments were then in about the same condition that they are now. What is your recollection as to their being, prior to May, 1872, in the same condition that they are now?

A. My idea has been that they might have been in a condition that they could be worked. I ain't sure. The instruments, at one time, I know, after I had quit using them, had been carried to the garret, or loft, of the shop. We then brought them down again, afterwards. They had been in a condition to work, until the mice had eaten the membrane out of the tin can "B." I don't know exactly what time that was.

Cross-Q. 1262. About what time was it, to the best of your recollection, when the instruments "F" and "B" were carried to the garret or loft?

A. That was about the time that I had made "C," or after that. I should suppose, about 1872, 3, or 4. Somewheres about that time. They were brought down again afterwards, for I know, even later than that, I showed them in connection with other apparatus.

Cross-Q. 1263. When were they brought down?

A. That was some time after they were taken up. I don't remember what years.

Cross-Q. 1264. To the best of your recollection, how long after they were carried up, was it, before they were brought down?

A. They might have been up six months, perhaps less, or perhaps more. I don't know.

Cross-Q. 1265. What was the occasion of their being brought down?

A. It might have been that I wanted to show them to some parties, as I know I did show them. That I wanted to show them how the first construction of the instrument was. That instrument may have been with some other ones—may have been taken on the garret several times. I think so. I think it was taken back and forward several times.

Cross-Q. 1266. You said that they were carried into the garret after you had quit using them, and you spoke of the membrane as being destroyed by the mice. Did you ever fit them up again for use, after you first quit using them?

A. I don't remember that I did. I remember of making changes of different membranes on that instrument, and on other instruments.

Cross-Q. 1267. Were those changes made while you were using them, or after you had quit using them?

A. The changes were made while I was using them—trying different kinds of membrane.

Cross-Q. 1268. Mr. Rufus K. Shireman, a witness called by the defendants, on page 271, [259–60] speaks of seeing instruments "B" and "F" in the fall of the year, not less than eight years ago, and on pages 275 and 276, [264,] he says, that all the difference he saw between the present condition of those instruments, and their condition when he first saw them was, that they were coated considerably better on the inside than they now are. Is it your recollection, that at that time, not less than eight years ago last summer, the condition of the instruments was such as he has described?

A. My idea was, that they had been used some since, but then I know the coating was better. The coating has been destroyed quite lately, or rather, within a year or two. I would suppose that in 1872 they had been used some. I will tell you what makes me think that, too. Because when I made "C," I used the tumbler on "C," and there was a time—it may have been a year or two—that I used "C" with it occasionally, perhaps not all the time. "C" was made before the wagon was painted, but still I cannot tell when it got into that condition.

Cross-Q. 1269. You have spoken of using bladders for membranes on "F" and "B," and some other materials. What material did you find the best for membranes on "B," and what material did you use most?

A. Bladder I had used the most, for it was most convenient for me to get. I didn't think there was much difference between the different materials. I don't remember that there was any particular difference.

Cross-Q. 1270. Was there any difference between "F" and "B," with reference to the material you used for membranes?

A. No, I didn't think there was. At one time I had used, on the tumbler, a metal plate—of tin.

Cross-Q. 1271. How long would a bladder membrane last on either "B" or "F," provided the mice did not eat it?

A. If the mice wouldn't eat it, it might last twenty years. I have no definite time how long it would last, but I would suppose it would last twenty years.

Cross-Q. 1272. George W. Drawbaugh, one of the witnesses for the Defendants, on page 628, [601,] was asked this question in respect to instrument "B": "Do you recollect what it was closed with?" And he answers: "I was under the impression that it was bladder. He was gathering up all the bladders around the country, at the time, from all the butchers. It was bladder though, I remember of asking him, and he told me that was what it was." Do you remember buying up all the bladders of the butchers, around the country?

A. I have got bladders from different parties, and from the butchers.

Cross-Q. 1273. Did you at any time make an attempt to gather up all the bladders around the country, from all the butchers?

A. Not all about the country, no. I don't know what extent it means, all about the country. There was only one butcher at our place. That is, at one given time. There was a number there at different years, though.

Cross-Q. 1274. How many times did you have to get new membranes for either "F" or "B?"

A. That I can't remember—how often. I had put on different membranes at different times, but the number of times I couldn't tell.

Cross-Q. 1275. You spoke of using, at one time, a tin plate instead of membranes, on instrument "F." When was that?

A. I couldn't tell the period, either, but that was some of the later experiments. That is, it might have been about the time that I made "C," or earlier. My recollection is not very good. Anything that I can remember distinctly, I will state.

Cross-Q. 1276. Which did you find the best on "F," the membrane, or the tin plate?

A. The tin plate, because that would not require so much adjusting —so frequent adjusting.

Cross-Q. 1277. After you had tried the tin plate and found it better did you use membrane on "F"?

A. I don't remember that I did, after that. I would suppose I did not.

Cross-Q. 1278. Did you use a tin plate on "F," when you were using "B" with it?

A. I don't know. I don't remember that I did. I might have, but I ain't positive.

Cross-Q. 1279. Did you use a tin plate on "F," when you were using "C" in connection with it?

A. Yes, sir; I think so. I know I used it in connection with "C."

Adjourned until Feb. 14, 1882, at ten, A. M..

February 14, 1882, *ten,* A. M.

Examination resumed pursuant to adjournment.

Present Mr. Smith and Mr. Storrow for Complainants, and Mr. Hill for Respondents.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross Q. 1280. In answering interrogatory 50, you made a sketch of your original cup instrument, which I understand was a tea-cup, and which appears to be represented in the drawing as about the actual size. Do the drawings correctly represent the size of the plates, E and F, at the bottom of the cup, and the distance between them, as you used it?

A. About as near as I remember it. I just made it by guess, or by memory.

Cross-Q. 1281. In answer to interrogatory 61, you mentioned several materials which you used for a low conductor, in this cup instrument, such as clean fine earth, and earth used in combination with plumbago, plumbago alone, and pulverized charcoal. Which of these substances did you find the best?

A. I don't remember exactly. I think the carbon was the best; that is, the charcoal.

Cross-Q. 1282. When you used plumbago, did you use commercial plumbago—pulverized plumbago, such as is bought?

A. It was plumbago—I got it in lumps, rather, and pulverized it.

Cross-Q. 1283. You spoke, in answer to interrogatory 62, of using also in that instrument, finely divided metals. Did you refer to bronze?

A. Yes, sir; I had used it in combination with the other low conductors, too.

Cross-Q. 1284. Can you give me an idea how finely you pulverized the charcoal, bronze, and plumbago, as compared with that commercial bronze?

A. I can't just remember how finely. I pulverized it in a mortar, and made it as fine as I thought would be practical.

Cross-Q. 1285. Do you think you made those substances as fine as bronze?

A. I don't know. They might have been as fine as bronze. Though there is different degrees of fineness of bronze.

Cross-Q. 1286. Did your experiments lead you to give a preference to one of those substances over the other, in your future use of the instruments?

A. I did, yes; that is, in charcoal.

Cross-Q. 1287. How much better did you find charcoal to be than either plumbago or bronze?

A. I don't remember, because I had them in combination, different ways; but I think charcoal was the best, as near as I can remember. That is, I am speaking of the cup instrument. I will state that I may have used coke in that instrument. I don't remember. In making them statements there, I spoke to the best of my recollection.

Cross-Q. 1288. When you came to use the instrument "F" you had, as I understand you, two forms; one where the lower plate was connected, to a single rod, as in the instrument which is now produced, and another where it was used with a stirrup, as shown in reproduced "F." Which of those two forms did you use first?

A. The form with the one rod. I could not say how long. I don't remember.

Cross-Q. After you adopted the second form, did you use the first form again?

A. I don't remember that I did. It may be that I did. There was a number of tops or mouth-pieces. I may have left them attached, I don't remember.

Cross-Q. 1290. I judged, by your answer to the 131st interrogatory, that after you were using instrument "F," you continued your experiments with various materials for a low conductor. You mentioned plumbago alone, plumbago mixed with other materials; that is, with carbon, pulverized charcoal and plumbago—"sometimes I used charcoal alone, at other times, finely divided coke and charcoal mixed; also, pulverized coke alone. I had used bronze; that is, finely divided metals mixed with carbon or coke, and various other materials that I cannot think of." What was the result of your trials with the instrument "F" and the various materials named, as to what was the best one, and what was the best condition in which to use it?

A. As near as I can remember, the coke, and the carbon out of gas retorts—hard carbon. I think them were the best in the tumbler instrument, but I had some good results from the combinations of the different ones. I mean the different combinations of coke and charcoal. I never used it solid in that instrument—finely divided.

Cross-Q. 1291. Did you find any difference between the coke and the carbon out of gas retorts? If so, which was the best?

A. I don't remember, but I judge that the gas retort carbon was the best.

Cross-Q. 1292. Do you think it was decidedly the best, or was there little difference between them?

A. I don't remember. I just think it would be the best. The time is so long that I don't just remember every particular experiment.

Cross-Q. 1293. Did you find that those materials were better the more finely they were pulverized?

A. Yes, sir.

Cross-Q. 1294. In what condition did you get the best results from them as to being moist or dry?

A. After my later experiments, I found that the dry carbons were the best. In the former—in using earth and some of them combinations—a certain degree of moisture was the best.

Cross-Q. 1295. What results did you get with bronze as compared with gas retort carbon or coke?

A. With bronze alone the results were not so good. I don't know that I could get any perceptible results at all with bronze.

Cross-Q. 1296. You had instrument "F" reproduced made under your own direction, did you not?

A. Yes, sir.

Cross-Q. 1297. And it was intended, I understand you, to show the condition in which you used "F" itself when it had the stirrups?

A. Yes, sir.

ELEPHONE COMPANY,-2

Cross-Q. 1298. I see that the cup at the lower end of the stirrup is provided with a powdered substance, which I suppose is intended for the low conductor. Will you tell me what the substance is and who prepared it?

A. It has been spilt a number of times. This may be a latter preparation. I can hardly tell. It may be carbon. There may be plumbago in it, by appearance. I prepared it. I suppose so.

Cross-Q. 1299. Did you prepare it specially for this reproduced instrument, or was it some which you had left over from your former use of "F?"

A. I think it was prepared for this instrument. I think so, to the best of my recollection.

Cross-Q. 1300. Does the reproduced drawing "F" show the depth of the low conductor, about as you used it when you were using "F" with the stirrup?

A. As near as I can remember, about the same.

Cross-Q. 1301. And that is about the same as it is in reproduced "F," is it not?

A. Yes, sir.

Cross-Q. 1302. Did you ever construct a duplicate of instrument "F;" that is, did you make more than one instrument of that kind before your reproduced "F" instrument?

A. I don't remember. I had a number of different mouth-pieces. I don't remember of making more than one, though I made different mouth-pieces. The number I don't remember.

Cross-Q. 1303. After you had ascertained what low conductor gave the best results, could you always get good results in using the instrument, either when you used it in connection with "B" or with "C?"

A. Yes, sir; by properly adjusting it. By letting the instrument stand, sometimes, I had to change the adjustment.

Cross-Q. 1304. Do you mean that you had to adjust the pressure between the plates upon the low conductor?

A. I had to change it, perhaps—sometimes I have more pressure and sometimes less pressure. By handling it roughly, the jar would compress portions and would settle the particles closer, and, perhaps, they would have to be brought down closer. The right pressure I would get by trial; that is, the plates would have to be brought down closer.

Cross-Q. 1305. Did you have to change the low conductors from time to time? I mean the carbon and coke powders.

A. I would change it frequently—very frequently.

Cross-Q. 1306. State your reason.

A. By experimenting—trying different combinations, and also different degrees of fineness of the conductors.

Cross-Q. 1307. I understood you to say that you got the best results from powdered coke and gas carbon, and that the finer you made them the better they were. After you had ascertained these facts, did you use either one or the other of them continuously, and did you find it necessary to change either of them for a fresh supply of the same material?

A. I don't remember that it was necessary to make any changes for a fresh supply. The changes, as near as I can remember, were experiments for different degrees of fineness and different combinations. I didn't find that I needed to change them for a fresh supply. I will tell you what I did do, sometimes. I would lift the plate up and loosen the particles of the conductor and then adjust it again.

Cross-Q. 1308. Did you find the coke and carbon powders give the best results, when they were in a loose condition, in using instrument "F?"

A. That is, when it was necessary to have it at a certain pressure I don't know what that pressure would be, but that I would find out by experimenting or trial.

Cross-Q. 1309. What I wish to know is whether, when you loosened up the powders when they had been pressed for a time, you got better results by thus loosening them?

A. Yes, sir.

Cross-Q. 1310 When you were using "B" and "F" with the membrane diaphragm, in what way did you secure the tension of the diaphragms? How much did you stretch them?

A. In placing on, I would dampen them and stretch them down—let them partly dry and press them down. I got a good tension always—pretty good. Then, the tension on "B" I would modify by a tension spring; that is, the tension was sufficient to be practical, I know.

Cross-Q. 1311. When you had once stretched a membrane on "B," could you then at any time secure the necessary tension by means of the spring you have spoken of, until the membrane was destroyed by the mice?

A. Yes, sir; for the tension spring or bracket, or whatever you may call it—I would loosen the screw and press it up towards the center of the diaphragm, and then tighten the screw again

Cross-Q. 1312. You have spoken of using in instrument "F," for compressing the low conductor, copper plates—silvered Daguereotype plates. Did you find that these were better than the tin plates, such as you used in the cup instrument?

A. Yes, sir; I thought so, because they wouldn't be so likely to corrode, but I had results in either way—from either plan.

Cross-Q. 1313. When the plates were fresh and uncorroded, was there any difference in the results which you got?

A. No, sir.

Cross-Q. 1314. What is the material of the plates now in instrument "F?"

A. Tin plate.

Cross-Q. 1315. In you answers to the 638, 639, 640, and 641 interrogatories, on pages 902 [868] and 903 [869], you described and represented a paper funnel, which you applied to instrument "B" at the same time. Why did you apply that funnel to it, and when was it that you did it?

A. That was at an early time. I tried that, thinking I would get better results by reducing the size of the opening at the can to a smaller compass.

Cross-Q. 1316. What do you mean by an early time? How early was it, and how long did you use the paper funnel?

A. I suppose I had that applied shortly after I first made the can. It was placed on, and taken off, at different times.

Cross-Q. 1317. What did you find the results to be, of using it?

A. As near as I can remember now, I don't think there was much difference.

Cross-Q. 1318. Is the electro-magnet, which is now on instrument "B," one which was on it before you quit using the instrument, and carried it into the attic?

A. I don't remember. I had a number of different magnets on. Most of them, that I had on, were larger than that. I don't remember which one I had on when I carried it to the attic. I don't remember whether it was on before I carried it to the attic. It is very likely there was an electro-magnet on, but which one I don't remember.

Cross-Q. 1319. Do you remember whether or not you used the electro-magnet, which is now on it, before you quit using instrument "B ?"

A. It is very likely that is the electro-magnet.

Cross-Q. 1320. Do you know, whether or not you actually used it, before you quit using the instrument ?

A. It is very likely I did, but I don't remember distinctly.

Cross-Q. 1321. I understand that you used other electro-magnets before you quit using this instrument, which were larger. How many electro magnets did you use before you quit using the instrument, and what were their sizes. How much larger were they than the one now on the instrument, and with what sized electro-magnet did you get the best results ?

A. The number I don't remember; there may have been two, three, or four. I don't remember. They were something larger than that. I could hardly say. Perhaps an inch and a half or an inch and three quarters long—the coils—and perhaps an inch or an inch and a quarter in diameter, as near as I can recollect. I got the best results with the larger ones, and those with the finer quality of wire.

Cross-Q. 1322. Did the larger and better electro-magnets, which you used on " B," have more wire around them than the present electro-magnets have, and was it finer, or coarser ?

A. In some of them it was finer, and I think there was more wire, because they were larger.

Cross-Q. 1323. How came the larger and better electro-magnets to to be taken off from instrument " B, " and the inferior one now on it to be put on ?

A. I can't tell you why. I suppose that one was there for trial, as near as I can remember. The one that is on now would give results. I am confident of that.

Cross-Q. 1324. When was the change made from the larger and better one to the one that is now on the instrument ?

A. During the time that I was experimenting with them. I don't know any particular period. I don't remember.

Cross-Q. 1325. Do you remember making any change in the electro-magnets of instrument " B," after you first carried it into the attic ?

A. I don't remember. I may have. It was carried to the attic more than one time. I don't remember when it was first carried to the attic more than one time. I don't remember when it was first carried to the attic.

Cross-Q. 1326. You had the reproduced instrument "B" made under your direction, did you not?

A. Yes, sir.

Cross-Q. 1327. Did you put on to it such electro-magnets as you had obtained the best results with, when you were using "B?"

A. I think I did, yes. I made a magnet, which I thought was such as I used.

Cross-Q. 1328. Do you mean such an one as gave you the best results?

A. I was instructed to make a reproduced instrument of the original. I made that, and put on an electro-magnet as near the size of the one that is now on the original as I could, because I was instructed that it should be made exactly like that one. Then I cut away the membrane to represent the same eaten off by the mice. Then another one to show it as it was when originally made and used. This one had an electro-magnet which was a little larger than the one now on "B."

[*Counsel for Defendant states, that the instrument last mentioned by the witness is the one which has been put in evidence as exhibit reproduced "B;" the other reproduction mentioned being merely a duplicate of "B," in its present condition, and not put in evidence, but retained for the purpose of use in case of any accidental loss or destruction of the original instrument "B."*]

Cross-Q. 1329. Is the metal diaphragm, which is now on instrument "C," the one which was on it at the time you were painting Sadler's wagon?

A. I think so. I wouldn't be positive.

Cross-Q. 1330. Have you any recollection of making a change in the diaphragm after that time?

A. No, I have no recollection of making a change.

Cross-Q. 1331. Is this diaphragm now in the same condition, as it was when you were experimenting with it, at the time when you painted Sadler's wagon?

A. I don't know. I don't exactly understand the question. It had been in condition to use.

Cross-Q. 1332. It is now somewhat crumpled, and rather loosely attached to the case. Was it in the same condition when you were experimenting with it, and attached to the case in the same way?

A. No, sir; it was secured to the case tighter. I don't remember whether it was crumpled then, or not?

Cross-Q. 1333. In what way was it then secured to the case?

A. By a ring, or that ring. I suppose the same ring.

Cross-Q. 1334. What change has been made in the way in which it is attached to the case, since you experimented with it, at the time of painting Sadler's wagon?

A. I don't know of any changes that were made, in the way of attaching it. It was attached by a ring. I couldn't state it any other way.

Cross-Q. 1335. Am I then to understand that it is attached to the case in the same way now that it was at the time you were painting Sadler's wagon?

A. Yes, sir; only it was more secure. The case may have dried in, or, by moving it pretty often, it might have become somewhat looser.

Cross-Q 1336. Have any changes of any kind been made in this instrument "C," since you painted Sadler's wagon?

A. Not that I can remember of. It may be—that small pin, on the centre of the armature, was placed there since. I thought it was understood that you couldn't use it without having an electro-magnet.

Cross-Q. 1337. How long since were the electro-magnet and the permanent magnet removed from it?

A. I don't know how long.

Cross-Q. 1338. Do the electro-magnets, which are in the reproduced instrument "C," correctly represent the electro-magnet which was on the original instrument, at the time you painted Sadler's wagon?

A. I think they represent them, only I think the other ones were a little larger. That is, longer in the coil.

Cross-Q. 1339. Was this instrument, at any time, carried into the attic, like "B" and "F?"

[*Objected to by Mr. Hill, as assuming that "F" was carried into the attic.*]

A. Not that I remember of.

Cross-Q. 1340. Was "F" carried into the attack at any time?

A I don't remember that "F" was. It may have been.

Cross-Q. 1341. Where was instrument "C" kept, and instrument "F," after "C" was made and used with a transmitter?

A. Different places, that I had tried them in. It was generally in a small room on bench under the desk, and sometimes in the desk—different places; and it may have been placed on shelves, that were in that room—two or three shelves that were fastened to the staircase, that went up to the attic.

Cross-Q. 1342. Do you mean the small room that has been spoken of as the private office?

A. Yes, sir; the small room at the northeast corner of the shop; but it may have been kept at other places in the shop. I don't remember. It was moved to different places in the shop.

Cross-Q. 1343. My previous question also inquired where "F" was kept after "C" was used as a transmitter?

A. I wonld have to make about the same answer. It was kept about the same places—different places.

Cross-Q. 1344. Do you mean that these two instruments "F" and "C" were kept in the place you have described, down to the time you first showed these instruments to Mr. Chellis and Mr Hill?

A. To the best of my recollection. Though, as I said in the other answer that I made, the instrument "C" might have been taken to the garret. I can' remember all the different places.

Cross-Q. 1345. What makes you think it may have been carried to the attic. Have you any recollection of its being carried there?

A. No, I don't have. But I have been in the habit of carrying some of my apparatus there, when not using them.

Cross-Q. 1346. Did you use "C" as a receiver, with any other instrument than "F?"

A. Yes, sir. I used it with "I," and I may have used it with others. I don't remember all the instruments.

Cross-Q. 1347. Will you name all the instruments that you used it with as a transmitter?

A. I used it as transmitter and received through that instrument "I"; also "A;" and I think, with "D" and "E." I ain't positive, though; and maybe others. I don't like to confine myself to any particular one. I don't remember what particular machines or instruments.

Cross-Q. 1348. When using it is a transmitter or when using it as a receiver with "I," or with any other magneto transmitter, did you use a battery with it?

A. No, sir; not with "C," but when using it with "F." I had used a battery, but not when using it with a magneto instrument?

Cross-Q. 1349. When you used "I" as a transmitter with any receiver, did you use a battery with it?

A. No, not with "I."

Recess for dinner until 2 o'clock, P. M.

Feb. 14, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel:

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 1350. You were asked in interrogatory 216, on page 819 [786]: "Are the electro-magnets now in exhibit "I" the same that were formerly used there in the instrument when you were operating it?

A. I think so; that is, in making search for the magnets—there were a number, etc." When was that search made that you refer to?

A. It may be about a year ago, perhaps.

Cross-Q. 1351. What was the occasion of its being made?

A. To hunt for the magnet—to look for the magnet. It had been laying about there. I concluded it was the magnet, then I tried it, and found it fit the instrument. The occasion was to hunt for the missing magnet that had been on the instrument. I had showed it to some parties, maybe Mr. Jacobs, and he asked where the magnet was. I don't remember that. I suppose so. I am confident that that is the magnet that was originally on the instrument.

Cross-Q. 1352. How long had the magnet been out of the instrument at the time you made that search?

A. I don't know. It had been out some time. It may have been a year, perhaps.

Cross-Q. 1353. Why was it taken out?

A. I don't know why. Perhaps it was taken out to use for some other purpose. I don't remember that. I frequently did take out magnets to use for some other purpose—in other instruments.

Cross-Q. 1354. How long was that instrument used before you made a better one to take its place?

A. I don't remember how long. It might have been used a year or two. I don't remember.

Cross-Q. 1355. Where was the instrument kept after you had discontinued its use?

A. It was kept in the shop—different places in the shop; I don't remember the different places. The top part had been found in the garret by Mr. Heiges, who is working at the shop now. He found a mouth-piece. I don't remember what it was. He found one that belonged to that instrument.

(The examiner certifies that there are two mouth-pieces that fit instrument "I.")

The flat one was the last one used. I think the larger one is the one that Mr. Heiges found.

Cross-Q. 1356. When did he find this one in the garret, and how came he to be making search?

A. It may have been—I think it was this winter a year ago, if I am not mistaken. I asked him to make search for different other parts of telephones while I was from home. I was away when the search was made.

Cross-Q. 1357 Did he find other instruments, or parts of instruments? If so, what ones and where did he find them?

A. I don't know. I don't remember of him finding any more than that part.

Cross-Q. 1358. How long after the instrument was first made was it that the flat top piece was made?

A. I don't remember how long. In making those parts, I didn't keep no account of time. I forget the length of time.

Cross-Q. 1359. Did you continue to use this instrument "I" after you made "D" and "E," or "L" and "M?"

A. I don't remember. I may have, and I may not. I may have used it in the way of showing persons coming to the shop.

Cross-Q. 1360. Was this instrument kept in your private office after you constructed the instruments "D" and "E," and "L" and "M?"

A. It may have some part of the time. The instrument, when I first got it to show to Mr. Jacobs, or some parties interested in this suit, was on top of a cupboard that had been put there by the Axle Company.

Cross-Q. 1361. Can you tell any other place in the shop where it was kept after you had experimented, with it and ascertained what it would do, and before it was placed on the cupboard where you found it when Mr. Jacobs inquired about it?

A. When experimenting, I had it in different places in the shop. It may have been in that private room, but I don't remember distinctly. I don't remember, because it had been in different parts of the shop. Those are questions I cannot answer.

Cross-Q. 1362. Did you see this instrument "I" in connection with any other instrument than "C?" If so, with what one?

A. I believe I stated that before. I suppose that I had used it with the glass tumbler "F." After making the modifications, I used it with several others. I am pretty sure—I am confident I did.

Cross-Q. 1363. What others?

A. I couldn't say exactly. I suppose with the small magnetos "D" and "E," and I may have, perhaps, with "C." After making the modification, I could use it as a magneto instrument. I could use it with "C," or I could use it with the small magneto instruments, or any other magneto instruments that I had.

Cross-Q. 1364. What modifications do you refer to in your last answer?

A. In placing to the bottom of the electro-magnet two permanent magnets.

Cross-Q. 1365. In your answer to the 231st interrogatory, page 821 [788-9], referring to exhibit "A," you say: "I thought then it was a pretty good instrument, though it was not as good as that instrument there (including "I" in its modified form, with the permanent magnets;) was not as loud. Will you state how much the difference was in loudness between those two instruments "I" and "A?"

A. I don't know. There was a difference. With the permanent magnets attached to the poles, after the modification, would be considerably better.

Cross-Q. 1366. How much did you use "A" after you ascertained it was not as good as "I," and with what instrument did you use it?

A. I don't know. I used it pretty often in showing,—how much, I can't state. I used that with the tumbler, and with "C," and, I suppose, with "I;" but "A" was not as good an instrument to use with a magneto instrument as it was to use with a battery and a carbon transmitter.

Cross-Q. 1367. What was the difficulty with "A," and why was it inferior to other instruments?

[*Objected to by Mr. Hill, so far as the question assumes that it was inferior, when used in connection with a battery and carbon transmitter.*]

A. Used with a magneto instrument it was not so good. If it had been provided with a permanent magnet at the heel of the electro-magnets, I suppose it would have been as good as any instrument. I thought it was a pretty good instrument when used with a battery and carbon transmitter.

Cross-Q. 1368. Where was this instrument kept during the year after it was completed, down to the time when you made your arrangements with Mr. Chellis and others?

A. In different places in the shop. In the small private room, and in different other parts of the shop. I know it had been in the drawer of a desk that I had in the private room. It had been kept in there sometimes.

Cross-Q. 1369. When was it kept in that drawer?

A. At different times. Sometime I would, likely, put it in there after trying it—showing it. I mean, showing it to parties that come to the shop.

Cross-Q. 1370. Was it kept in that drawer, or in that private room, when the Axle Company were there?

A. Yes, sir; I think so.

Cross-Q. 1371. Where was it kept while the Clock Company was in operation?

A. In the shop, in different places. I had it, perhaps, in that drawer of the desk. I don't remember what places, now.

Cross-Q. 1372. Do you remember of its being kept in any other place than the drawer, or the small private room, when you were not actually using it?

A. It may have been, if I could just think. I had other drawers in the shop. I had drawers in the wood working benches, in the wood shop. It is likely it may have been put in there, just after being used on a bench, but I can't state positively that it was.

Cross-Q. 1373. Did you ever take it away from the shop, to show it to any persons? If so, when and to whom?

A. I have taken different instruments away. I don't just remember particularly what instruments. I had some of the instruments at my house, at different times

Cross Q. 1374. Did you ever bring this instrument "A" into Harrisburg to show it to any parties, before you made your arrangements with Chellis and others? If so, to whom?

A. I don't remember of bringing it over to show to any one. I brought an instrument over to show to Mr. Stees, at one time. I was under the impression that it was one of the magneto instruments, "D" and "E."

Cross-Q. 1375. Did you even take this instrument "A," or any of your other instruments, to the office of the Western Union Telegraph Company, in this city, to show any person there?

A. I don't remember distinctly. I may have, when I brought the instrument to show to Stees. If it was, it was one of those small ones.

Cross-Q. 1376. What is your best recollection as to whether you did or did not take an instrument to the office of the Western Union Telegraph Company?

A. I remember distinctly of showing one to Stees, but I don't remember that I ever brought one and showed it to parties at the Western Union Telegraph Office. Mr. Stees had one of those transmitting boxes—not this one (indicating "H,") but the one marked "J," and the receiver marked "N." He may have shown it to some parties. It was at his place, perhaps, two or three months.

Cross-Q. 1377. Which were the best instruments for receivers, "A," or "D" and "E?"

A. "D" and "E" were the best. They were not the loudest. When used with a battery, "A" was louder; but "D" and "E" were plainer—more distinct.

Cross-Q. 1378. Where were "D" and "E" kept, after they were constructed?

A. Like some of the other machines, in different portions of the shop.

Cross-Q. 1379. Were they kept in the small private room?

A. Yes, sir; part of the time.

Cross-Q. 1380. Was the same true of "L" and "M," and "G" and "O?"

A. All the machines were kept in different portions of the shop; sometimes in the small room, and sometimes in other portions of the shop.

Cross-Q. 1381. In your answer to interrogatory 391, page 858 [825] of the record, you said, that before you went to the Centennial you had heard that somebody else, besides yourself, had invented a speaking telephone, or a telephone. How did you hear that, and how long was it before you went to the Centennial?

A. I don't remember, now, how long it was before. It wasn't long. In the summer of 1876, some person told me, or I may have read it; but I think that some person told me.

Cross-Q. 1382. What did you hear or read about it?

A. That some other party had gotten up a telephone, and had it on exhibition at the Centennial.

Cross-Q. 1383. Have you no idea who the party was, or where you read it, if you read it?

A. I suppose that when I was told I heard it, but I don't remember. I don't remember names very well.

Cross-Q. 1384. My inquiry was, who the party was who told you about it, if it was a party that told you, or where you read it, if you read it? Have you any idea where you obtained that information?

A. Indeed I have not. I had read different papers—I often do—but what paper, I don't remember.

Cross-Q. 1385. What papers were you accustomed to read?

A. I was a subscriber of a county paper—a paper published in Carlisle—the *American Volunteer*—for six or seven years.

Cross-Q. 1386. Was that the only paper you were accustomed to read at that time?

A. That was the only paper I was a subscriber to. I would pick up other papers when I would be where I had access to them.

Cross-Q. 1387. When and how did you next learn anything about any telephones made by other parties?

A. I can't remember exactly—that is, when they were putting up telephones through the country. I suppose, here in Harrisburg.

Cross-Q. 1388. Did you learn anything about them before they commenced putting them up in Harrisburg, or read any description of them?

A. I don't remember that I did. I may have, but I don't remember.

Cross-Q. 1389. Do you remember reading anything about them in Harrisburg papers about the time or before they were put into use here?

A. No, sir. I don't remember. I may have, but I don't often read a Harrisburg paper.

Cross-Q. 1390. When did you first see speaking telephones in use in Harrisburg, or in any other place?

A. I can't hardly state that. I suppose, a short time after they were introduced. I saw them first at Harrisburg.

Cross-Q. 1391. Where in Harrisburg did you see them and what kind of instruments were they?

A. I don't remember the name. I think it was the "Phelps"—an oval shaped magneto instrument with the mouth-piece at the end. I saw it at Stees' office.

Cross-Q. 1392. Where else did you see telephones in Harrisburg after that, within the following year?

A. At a good many different places; in a good many different business houses.

AMERICAN BELL TELE

Cross-Q. 1393. At what time was it that you first saw Phelps' instrument at Stees'?

A. I don't distinctly remember the year, but I think it was in 1878, I think so—1878 or 1879. I wouldn't be positive about the date.

Cross-Q. 1394. Did you see any other kinds of instruments besides the other Phelps' instrument in use in Harrisburg?

A. Yes, sir. A number of them.

Cross-Q. 1395. What kinds did you see and where did you see them?

A. I guess the Bell instrument—a small box and a receiver—called the Bell telephone. I see them in different places. I see it nearly every evening, when I go to the train, in the Cumberland Valley depot, and there is one at Kelker's hardware store, and a number of places. I understood the question as coming down to the present time. But the year after I saw it at Stees' there was a good many in town. I saw some more oval shaped machines than others. I don't just remember. I seen at the Western Union Telegraph Office, I think, the Blake receiver. I am not sure about the name, but it had a number of permanent magnets attached to the end opposite to the diaphragm; I might say, some four permanent magnets.

Cross-Q. 1396. Was the small box which you spoke of as being a part of the Bell telephone, a trasmitting instrument?

A. Yes, sir.

Cross-Q. 1397. Did you ever see any of the telephones which were in use in the office of the Western Union Telegraph Company?

A. Yes, sir.

Cross-Q. 1398. When did you first see them there and what kind of instruments were they?

A. The first was the instrument I had reference to. I believe they term it the Crown instrument. I thought it was the Blake instrument. I also, at the same time, seen the oval instrument. Mr. Clute was showing them to me. I suppose that was in 1878 or 1879. I don't remember the year exactly.

[*By the words "they term it the Crown instrument," witness refers to conversation here in the room, in which it had been referred to as the Crown instrument.*]

Cross-Q. 1399. When did you first hear of Mr. Bell in connection with the invention of the telephone?

A. I don't know. It was not a great while ago—about 1879 or

LEPHONE COMPANY,-2

1880. That is, that I now remember the name; I may have heard it before, but didn't remember the name.

Cross-Q. 1400. Did you ever hear Mr. Edison spoken of in connection with the telephone as an inventor? If so, when did you first hear of that, and what did you hear?

A. Yes, sir; I heard that about 1878. I heard that he was the inventor of the phonograph before I knowed of him being the inventor of the telephone.

Cross-Q. 1401. When did you first hear about him as the inventor the telephone, and what did you hear?

A. I don't remember. It may have been in 1878 or 1879. I don't remember. I was told that he invented the telephone.

Cross-Q. 1402. Did you ever see any telephone which was said to be his invention?

A. Yes, sir; at the First National Bank, at Harrisburg.

Cross-Q. 1403. What kind of an instrument was that?

A. There was a projection, or a box with an inclined lid—in desk form—and a curved arm. On the end of that was the transmitter, with a small mouth piece attached to the curved arm.

Cross-Q. 1404. Was the oval Phelps instrument which you first saw marked "Patented," do you remember?

A. I don't remember.

Cross-Q. 1405. Did you make any inquiry to ascertain whether it was a patented instrument or not?

A. I don't remember. I may have.

Cross-Q. 1406. Did you feel any interest whether some one had obtained a patent on the telephone?

A. Yes, sir; I did.

Cross-Q. 1407. Did you make any inquiries of any one to learn whether it was patented or not?

A. I may have. I don't remember.

Cross-Q. 1408. You have spoken of a line, about 100 yards long, which you had extended from your shop down the Yellow Breeches creek. Where did you get the wire for that line?

A. It was wire that I got from parties that had iron fence. Part of it I got from one William Heck. I got wire at another time from William R. Gorgas. I only remember getting it once from Mr. Gorgas.

Cross-Q. 1409. Did you get that wire from Mr. Gorgas personally, or from the man in charge of his farm?

A. I don't remember now. It came from that farm. I think I had spoken to Mr. Gorgas.

Cross-Q. 1410. In your answer to the 164th interrogatory, on page 808 [775], you spoke of another circuit, which extended back of that blacksmith's shop. Did you use your talking machines on any other circuits outside of the shop, except this one down the Yellow Breeches creek, and this one which extended back of the blacksmith's shop?

A. No, sir; only at my own house; that is, the house that I lived in.

Cross-Q. 1411. How long did you keep up the line down the Yellow Breeches creek?

A. Not very long. I had it put up several times. The wire was just temporarily put up.

Cross-Q. 1412. Mr. William Eppley, a witness called for Defendants, testifies to visiting your place during 1873 to 1875, and your showing instruments which you called talking-machines, and, on page 294 [281], he was asked, in interrogatory 10, "What did he tell you about his machine?" and he answered, "He told me that he had tried it on wires that he had strung for several miles on fences or trees, I forget which, to see how far he could carry the sound distinctly, that he was operating on them." Did you tell him that?

A. Yes, sir; I had forgotten that. I had it on a wire fence. I had insulated a number of wires on the fence, back and forward—on a long fence. It was a wire fence, and I arranged those wires. They were fastened to the posts, and midway between some of the posts there were iron wires wrapped to keep them from swinging. Them thin wires I took off and made a continuous line out of the strands, which would make—I do not know whether it would be several miles. It was over a mile, and I suppose it might have been a mile and a half. The wires were suspended between posts, and were stapled to the posts, and midway between each pair of posts there were small thin wires wrapped around the fence wires, and running from top to bottom of the fence to keep them from swinging.

Cross-Q. 1413. Whose fence was that?

A. William Heck's.

Cross-Q. 1414. The next question put to Mr. Eppley was, "Did he say from whom he had procured that wire, or what description it was?" and he answered, "He told me that he had got—still I am not positive—from Mr. Gorgas common fencing wire that he used to use, some years ago. Mr. Gorgas had used it for fencing wire." Did you tell him that you procured wire of Mr. Gorgas?

A. I didn't tell him that. I wouldn't have told him that.

Cross-Q. 1415. Did you tell him anything about procuring wire of Mr. Gorgas?

A. I may have. I don't know what the conversation was. I bought wire from Mr. Gorgas, and I had bought wire from Mr. William Heck.

Cross-Q. 1416. What instruments did you use in connection with that wire fence?

A. I think it was the tumbler instrument and "A." I ain't too positive, though, but I think them was the instruments.

Cross-Q. 1417. Do you remember what results you got?

A. Them results were--I had put the transmitter in the neighborhood of a clock, and passed over this line. I run a wire from the fence to the shop (it was right above the shop, where this fence was, on the hill north of the shop) and returned one. That experiment was in an evening. It was rather dark—dusk, you might say. I conld hear the of ticking the clock over the line.

Adjourned until February 15, 1882, at 10, A. M.

Feb. 15, 1882, ten, A. M.

Examination resumed pursuant to adjournment.

Present Mr. Smith and Mr. Storrow for Complainants, and Mr. Hill for Respondents.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued.

Cross-Q. 1418. In answer to the 66th and 67th interrogatories you speak of testing the action of the low conductor in instrument "F" by a galvanometer, which showed the different degrees of compression by the vibration of the diaphragm, produced by the sound immediately in front of the diaphragm. Will you describe particularly the way in which you made those experiments or tests, and specify the galvanometer which you used in making the tests?

A. Yes, sir. The instrument would be connected to the galvanometer with a battery in the circuit. Then I would make a sound, musical tone, or mention some words. I noticed that if the galvanometer moved it would indicate a feebler current when producing a sound. In making those experiments I would adjust the transmitter that the circuit would indicate on the galvanometer, about half the strength of the battery current. Then I would produce sounds in front of the diaphragm of the transmitter, and noticed that the needle would indicate a less current—a feebler current. I also made different sounds of different strength. Then I took a hammer and struck a board a foot and a half to two feet away from the transmitter, or about that distance, and I discovered that it produced the same kind of results, only perhaps not so strong. Then I tried the same thing on a magneto-transmitter and sometimes did not see any result at all. I might state here the reason why there would not be any result. In producing the sound on a magneto-transmitter, the current produced by the sounds would not be in the same direction. Every alternate vibration to the right, and to the left would give first a positive, and then a negative current; and then the galvanometer needle would not indicate the current, though sometimes I thought there was feeble results in the galvanometer.

I tried those experiments at difforent times, though I know in my earlier experiments the galvanometer was a very crude affair. The needle was just suspended on a string without a dial.

In the experiments I have described, I did not use an induction coil; By putting an induction coil in the circuit the results were about the same as in the magneto-instruments. When I used the induction coil I put the galvanometer in the secondary circuit.

Cross-Q. 1419. You say in making those experiments, "I would adjust the transmitter that the circuit would indicate on the galvanometer about half the strength of the battery current." Do you mean half the strength which it would have when the transmitter and receiver were moved from the circuit, or half when the transmitter was removed?

A. Half what it was when the transmitter was removed. I did not use a receiver in making those experiments. The galvanometer took the place of the receiver. I had used the galvanometer in the circuit with the transmitter and receiver, but the receiver was not used in these experiments that I have stated here.

Cross-Q. 1420. In making these experiments did you use either of the galvanometers, and if so, which one that you referred to, and was it one of which you made a sketch in the earlier part of your cross-examiuation?

A. I tried experiments at an early time with a crude galvanometer. That is the one I think I made a sketch of. I tried it on other galvanometers, but I can't state the date of these experiments.

Cross-Q. 1421. Can you state how much difference there was in the deflection of the needle when you were making sounds before the diaphragm and when you were not?

A. I can hardly state that. In my first experiments I didn't have a dial—about one-eighth, or one-tenth, of a half revolution; that would be one-sixteenth, or one twentieth of a revolution, as near as I can judge now.

Cross-Q. 1422. What do you mean by a revolution? Do you mean an entire circle?

A. What I mean is one turn of the needle.

Cross-Q. 1423. Do you mean one turn through an entire circle?

A. Yes, sir.

Cross-Q. 1424. In interrogatory 1198 I asked you, "Have you had any means of ascertaining the names of all the parties to whom you sold rams, and the prices which they paid?" You said that some of the bills and accounts of them had been lost, but if you was to reflect over it a while you might. Are you able now to give the names of more parties that you sold rams to and the prices?

A. I have forgotten it. I have not reflected and have forgotten it. If you would read over the parties you have there, I might, maybe, think of others.

Cross-Q. 1425. In your answer to the 197th interrogatory, you mentioned the names of Henry Herr, Mr. Trimmer, William Stephen, John T. Smith and Mr. Brant. Can you now give the names of any other parties?

A. I think I can, of two. Mr. Abraham Fisher, one of the witnesses in this case; George Kissinger. That is all that I can think of. I don't rememember the prices they paid.

Cross-Q. 1426. Have you any means of ascertaining the amount of pipe which you purchased of parties to put in with the rams?

A. I may have. That is, I can get it by looking over some bills. I may get some.

Cross-Q. 1427. Will you look the matter up to-night and ascertain as far as possible?

A. I will. I might state, too, that some of the parties purchased their own pipe. Mr. Stephen purchased his own pipe, or part of it.

AMERICAN BELL TEL

Cross-Q. 1428. Referring again to the subject of the clocks, you stated in your answers to interrogatories 883 to 889, in substance, that before the Grissingers took hold of the business, in 1878, you had built three clocks provided with cases. Two were built with their cases before you went to Mechanicsburg to live; one—in 1877—carried to Mechanicsburg, and another was built after you returned from Mechanicsburg, and before the Grissinger's took hold of the business, this being the one, as I understand it, Johnson Leonard afterwards exhibited. George Drawbaugh, in answer to interrogatory 31, on page 626 [600], says that he was at work for you in 1877, and from the 30th of April to the 22d of June, he built several clock cases, and in answers to interrogatories 83 and 84, he says that before he worked for the Clock Company he built two and altered a third, which you had previously made. Do you think he is correct about the number that he built and altered, or that you may be mistaken about the number of cases that you built before 1877?

A. My impression now is that I built two before I moved to Mechanicsburg. That is, the case of the one I took to Mechanicsburg was built before, or near the time, I moved to Mechanicsburg. That is the one George altered in 1877, or the time he says. I don't remember the time exactly, that he worked for me. It was after I came from Mechanicsburg, he done work on the clocks. I don't remember exactly the number. I don't remember exactly. I know he worked on clock cases, but don't remember the number. I think that the first case I made he helped me on, and that it was made before I moved to Mechanicsburg; and he may have done some work even on the second. When I said that I made them, I did not just think that they were made by me, for I had some one to help me. That is what bothers me—about the number. He helped me to do work. Those two clocks are still at the shop yet.

Cross-Q. 1429. Do you think that George was mistaken in saying that he built, in 1877, two clock cases and altered a third?

A. No, I don't think he was. I think he helped to build two cases; but in 1877—I don't remember the time. It was after I came from Mechanicsburg. I don't remember that it was in 1877, but it is likely that that it was in 1877.

Cross-Q. 1430. If he did build two in 1877, besides altering the one which went to Mechanicsburg, do you think that you built, or had built, two cases before that clock was carried to Mechanicsburg?

A. There were two, including the one I carried to Mechanicsburg.

I think he helped me to make them. I am sure he helped me on one of them.

Cross-Q. 1431. One of the clocks, that he built the case for in 1877, was the Johnson Leonard clock. Now what clock did the other case, of the two that he built in 1877, belong to?

A. I don't remember of any other in 1877. I think the next clock, after the Johnson Leonard clock, was the one that is now in Mr. Jacobs' office. That he helped to build, I know.

Cross-Q. 1432. Mr. Samuel Hertzler, on page 730 [701], gives an account of your coming to him and getting money to enable you and your wife to attend your father's funeral; that he gave you five dollars, as he says, for that purpose. Did your wife attend the funeral with you?

A. No, sir; she intended to, but did not.

Cross-Q. 1433. On page 869 [835], in answer to interrogatory 446, you refer to a settlement with your brother Henry about a distillery. What distillery was that, and what relation or interest had you in it?

A. I had no interest in the distillery. It was a distillery that he had in Perry county.

Cross-Q. 1434. What settlement did you have with him about it, if you had no interest in it?

A. I made drawings or plans that the Government requires on distilleries. That is all I can think of that we had a settlement about.

Cross-Q. 1435. On pages 881 and 882 [847 and 848], you have spoken of circumstances attending the borrowing of some money of David Ditlow. Was he any relative of the Ditlow who has been examined as a witness in this case on behalf of the Defendants?

A. Yes, sir; he is the step-father of David Ditlow.

Cross-Q. 1436. Did you, after the original Faucet Company was formed, do any work for Etter & Shanklin's mill?

A. I did some work, but I don't remember exactly what time it was. It may have been twenty-five or thirty dollars—perhaps more. I don't remember. That amount was all taken out in mill feed, I know, and he told the miller that, after the account was out, he shouldn't give me any more—shouldn't trust me with any.

Cross-Q. 1437. Who was that miller?

A. George Engle, I think.

Cross-Q. 1438. How far is that mill from your shop?

A. Perhaps in the neighborhood of a quarter of a mile, as near as I can judge.

Cross-Q. 1439. After the time referred to in the last interrogatories, did you do any work for Hake's mill? If so, when and how much, or for Ross' mill.

A. I don't remember exactly the time. I did some work for Hake's mill. I don't think I done any work for Ross' mill. The Faucet Company done some work for Ross' mill. I mean Ross' mill at New Cumberland. I don't remember how much work I did at Hake's mill. It wasn't a big amount.

Cross-Q. 1440. Did you, after the period referred to, do any work for any other mills than those mentioned?

A. I may have done some work at the mill at our place there—at the village—I don't remember.

Cross-Q. 1441. Abraham Fisher testifies, on page 718 [689], in answer to interrogatory 13, that he got his ram from you in the latter part of May, 1874. In your testimony, in the interference record between David A. Hauck and Daniel Drawbaugh, I find, on page 65, in answer to cross-interrogatory 140, this statement: "*Here is a sketch of a machine I got up for supplying steam boilers with feed water. I know that is more than four years ago. Here is a memorandum in the same book*, '*A. Fisher, Dr.*, (*dated June* 7, 1873,) $64.90.' *I know the circumstances. I wrote that when I was in a stage coming from York Springs to Mechanicsburg. That is the date.*" Is that "A. Fisher" Abraham Fisher; and if so, what was that $64.90 for, which was due in June, 1873?

A. That was for a ram. That is the Abraham Fisher who testified.

Cross-Q. 1442. He says he got his ram in May, 1874. Did he have another in 1873?

A. No, sir; the ram that he refers to is a ram that I had made the charge, or memorandum, while going in the stage. I don't remember the time, but I went by the date, at that time, that I took down as a memorandum. He may have been mistaken in the date.

Cross-Q. 1443. Mr. Fisher says that he verified the date of May, 1874, by looking at books or memoranda made at the time. If he is correct about that, how is it you happened to charge him in June, 1873, for a ram that he did not have until May, 1874?

A. I don't know. I am confident that I put that in the book while coming down in the stage. I may have made a mistake. I don't know.

Recess for dinner until 2, P. M.

Feb. 15, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued.

Cross-Q. 1444. Did your brother John help to purchase the farm for your father which you have testified about?

A. No, sir; not to the best of my recollection.

Cross-Q. 1445. Did he make an affidavit to be used on the motion for a preliminary injunction in this case?

A. I don't remember.

Cross-Q. 1446. Do you remember talking with him about it?

A. I do not. I may have spoken to him in relation to machines, but I don' remember of speaking to him in relation to an affidavit for that purpose.

Cross-Q. 1447. You say you may have spoken to him about machines. Do you mean that at the time when the affidavits were being prepared you spoke to him about your talking machines?

A. Sometime about the beginning of taking affidavits in this suit. I don't rememner exactly what time though. I was not too sure. It would have been about that time if I had spoke to him.

Cross-Q. 1448. To the best of your recollection did you, or did you not, speak to him on the subject?

A. To the best of my recollection, I don't remember of speaking to him.

Cross-Q. 1449. You understood, I suppose, that my last question related to your talking with him about the talking machines themselves, and does not refer to talking to him about an affidavit?

A. I suppose I talked to him about what he remembered of the machines, but I don't remember when that was.

Cross-Q. 1450. Do you, or do you not, remember that about the time when you were talking with other persons about affidavits, you talked with him about the talking machines and what he knew about them?

A. I may have, but I don't remember. I am positive I don't remember when.

Cross-Q. 1451. Did your brother Henry make an affidavit to be used on that motion?

A. I positively don't know. He may have.

Cross-Q. 1452. Do you know whether he made an affidavit at any time relating to the talking machines?

A. I know that he was a witness in the case, but I don't know whether he made an affidavit before.

Cross-Q. 1453. Do you remember talking with him about that time, either as to making an affidavit or as to what he knew about the talking machines, about the time when you were procuring affidavits from other parties, or shortly before that?

A. I spoke to him in regard to what he knowed about it, but the exact period I don't know. It may have been about the beginning of taking affidavits, or we may have taken his affidavit—I don't remember.

Cross-Q. 1454. You have testified that you made an affidavit in 1880, to be used on a motion for preliminary injunction. Where were you when you made that affidavit, who wrote it, and before whom did you make oath or affirmation to it?

A. I was in Washington—I think so. I would not be too positive. I think Judge Hill wrote it, if I ain't mistaken. I don't remember who it was before—some officer in the same building, I think.

Cross-Q. 1455. Were there any other persons there who made affidavits at that time?

A. Harmon K. Drawbaugh, I think.

Cross-Q. 1456. Can you give me the affidavit to examine which you made at that time?

A. I haven't got them and I can't tell you where they are.

[*Counsel for the Plaintiff asks the counsel for the Defendants to hand the affidavit to the witness for the purpose indicated in the last interrogatory.*]

[*Counsel for Defendant replies that the affidavits are not here in this city, and he does not know whether they are in possession of Defendant or Defendant's counsel, as he, Defendant's counsel, has not seen them for a great many months. But if he had them in possession, he knows of no rule of law or evidence that would entitle the Complainant's counsel to cross-examine upon them.*]

[*Counsel for the Plaintiff requests the counsel for the Defendant, Mr. Hill, who is now present, to ascertain, if possible, in whose possession the affidavit is, and to produce it for the purpose indicated before the close of the examination of the witness*]

[*Counsel for the Defendant, Mr. Hill, replies that so far as he recollects there has never been any affidavit of this witness taken to be used on Complainant's motion for preliminary injunction, nor since the institution of this suit, although there was an affidavit taken prior thereto for another purpose. No affidavit of this witness has ever been filed in this case nor made a part* *of the record thereof, and as the affidavit that was taken is not here and it would involve considerable trouble and delay to get it, and as the Complainant's counsel is not entitled to cross-examine upon it or to require its production, Defendant's counsel declines to take the trouble to procure it.*]

Cross-Q. 1457. In answer to the 373rd interrogatory, you stated that you have made applications for letters patent on your electric speaking telephones, and in answer to the next interrogatory you said that you made your first application for letters patent on the telephone in July, 1880. How many applications have you made on your electric speaking telephones?

A. I don't know how many applications there were. Whether there was more than one in July, or whether they were all combined in one, I ain't prepared to state.

Cross-Q. 1458. My inquiry was not limited to the month of July, 1880, but has reference to all that you have filed, as well as to the one which you first filed in July, 1880. How many applications have you made in all?

A. I don't know how many there were. The drawings and machines were made, and I think I signed the specifications last summer, but I ain't positive if they were filed. I would have to refer to the Company, or Judge Hill to know. Those were after the first applications that were filed. I made two or three improvements since July 1880, in regard to telephones. The drawings of them were made and sent on.

Cross-Q. 1459. Did you make any applications after July, 1880, until last summer?

A. Well, I got up the machine, and the drawings made and the specifications were written in my shop by Mr. Abraham, but don't know whether they were filed or not. If they were, I don't remember. I don't remember. The ones written by Abraham was the ones next to those of July, 1880.

Cross-Q. 1460. Did the ones which are written by Mr. Abraham relate to inventions you have made since July, 1880?

A. Well partly relates to inventions—it relates to an invention called the cone telephone.

Cross-Q. 1461. Did these applications, which were prepared by Mr. Abraham, relate to any of the inventions which are contained in any of the instruments which have been produced in evidence in this case?

A. No, sir.

Cross-Q. 1462. What instruments were described in the application or applications which were made in July, 1880 ?

A. The one that has the bell, "H," I think. I don't remember the different ones. There was different ones there. And, I think, the one that is a little smaller—" J, " I think, with the double carbons, and I think there was some others. I ain't too positive. I don't remember.

Cross-Q. 1463. I ask you now to refer to the drawings representing the instruments which have been produced in evidence, and state in succession whether or not the following instruments were described in that or those applications made in July, 1880: " F " and " B," " C " and " I," " A," " D " and " E," " L " and " M," " G " and " O," " N," " P," and " Q," " H ? "

A. I Don't remember as to " F " and " B." I don't remember whether " C " and " I " were. I don't remember of " A." I don't remember of " D " and " E." (Judge Hill says now that they were.) I don't remember as to " L " and " M." I don't remember as to " G " and " O," though that may have been in connection with the bell instrument "H," or with the one smaller with double carbons "I," I think. I don't remember about " Q" or " P." I remember that " H " and " J " went in, because in writing the specification they asked me a good many questions about them. I remember of other instruments being present at the time the specifications were made.

Cross-Q. 1464. Mr. Peter C. Zimmerman, one of the witnesses called for defendants, on page 437 [418], gives an account of a conversation with you at one time, as follows: " The remark was this, that he heard Mr. Samuel Hertzler's daughter play on the organ, probably a quarter of a mile from his place of residence. Whilst she was playing the organ, he took notice that there was a sound of a cut-off in that organ, just like a ' tap, tap, tap,'—a cut-off in that sound. Being anxious to know what caused it, he went to Samuel Hertzler's, and found a break in the window glass; being loose, it would jar. From that, he seen what the cause was of that there sound—cutting-off like. Then, he said that that showed him that he was right. That gave him an idea that he was right in his study." Do you remember the circumstances which Mr. Zimmerman refers to.

A. I don't remember.

Cross-Q. 1465. Have you a melodeon or parlor organ in your house ?

A. Yes, sir; an organ.

Cross-Q. 1466. When did you procure it, and of whom?

A. I procured it about three months ago.

Cross-Q. 1467. What did you pay for it, and how?

A. I paid—I most forget the price—I think it was one hundred and eighty dollars. I paid for it partly in cash, and he took another organ that I had. He allowed me thirty or thirty-five dollars. I don't remember the amount—thirty dollars is what he allowed me for the old instrument.

Cross-Q. 1468. When did you purchase the old instrument, and what did you pay for it when it was new?

A. I don't know whether I could give it exactly. It was a short time after I sold an interest to the Faucet Company—the old Company, composed of Gorgas and others. I don't remember the year—1866 or 1867. The price I do not remember.

Cross-Q. 1469. Can't you give me some idea what the price was originally—whether it was a hundred dollars, more or less?

A. It was more, I suppose, more than a hundred dollars, but I don't remember the exact price.

Cross-Q. 1470. Do you think you may have paid $150 for it?

A. I may have, though I think not.

Cross-Q. 1471. Did you buy it before you moved into the house which you purchased about that time?

A. Yes, sir.

Cross-Q. 1472. When you moved to Mechanicsburg, did you purchase any furniture to furnish that house, or did you rely wholly upon what you had previously had?

A. I didn't buy any furniture; no, sir, not to the best of my recollection..

Cross-Q. 1473. When you moved back to Eberly's Mills, did you take all your furniture into the house which you moved into, or did you store some of it elsewhere?

A. I took some of it to the shop—a pair of bedsteads and a secretary in bureau form, which I sold to Mr. Renninger. I took vegetables—potatoes and other things of that kind—in payment for it.

Cross-Q. 1474. When did you move back to Eberly's Mills, and what house did you move into?

A. I moved back in the spring of 1877, to a house immediately in front of the mill, in the village there.

Cross-Q. 1475. How long did you live in that house, and into what house did you move when you left it, if you did leave it?

A. I lived in that house, I think, only one year. I won't be too positive. I may have lived there two years. The next house that I moved into was the house immediately back of the mill, where I now live. That is the same house that I lived in in 1867, before I bought the Eberly's Mills house from Hauck.

Cross-Q. 1476. Have you, during the past few years, had in your possession copies of the Patent Office rules, or of the Patent law, which were issued by the Patent Office?

A. I think so. I have had it already. I don't know whether I have it now.

Cross-Q. 1477. Do you recollect in what year it was published, and whether it embraced both the Patent laws and the rules of the Patent Office?

A. I couldn't state when it was published, but it had the rules and Patent laws. I never read it very particularly.

Cross-Q. 1478. Will you look to-night and ascertain its date of publication, and let me know in the morning?

A. I will if I don't forget it. I sometimes I forget. It is late when I get home. I don't know whether I have it yet.

Cross-Q. 1479. Will you look at the printed copy of the record of the testimony on your behalf in the interference case, between David A. Hauck and Daniel Drawbaugh, which has been heretofore referred to, and which I now hand you, and state whether you were present when the several witnesses testified on your behalf, and whether you procured them to appear as witnesses for you, or any of them?

A. I will make a statement without looking. I was present at the biggest portion of the witnesses, when their evidence was taken. And I was along when we went to see the parties, that were to give in evidence. I will look at, if you wish it. I have no eye glasses with me now. (*Witness is supplied with a pair, after which he looks at the record, and says:*) I was present at part of the evidence of Jacob E. Shettel. I was not present at the evidence of Henry F. Drawbaugh, when he give in his. I wasn't present when Samuel Hertzler give in his. I think I was present when William C. Diven give in his evidence. I wasn't present when William S. Dellinger give in his evidence. I don't think I was present when Jacob Evans gave in his. I may have; I don't know. I think I was present when William Fettrow gave in his evidence. I won't be too positive. I was not present when Henry S. Rupp gave in his evidence. I was present when part of

Abraham Shank's evidence was given in. I ain't positive whether I was present when Daniel Fettrow gave in his evidence. I was present when Ira D. Kahney gave in his evidence. I don't think I was present when J. B. Drawbaugh gave in his evidence. I was present when John C. Smith gave in his evidence. I was present when Dr. John W. Moffit testified. I was present when George Phillips testified. I was present when E. W. Chellis testified. That is the last.

Cross-Q. 1480. Will you look at your own testimony in that record, and say whether or not, according to your best recollection, the statements therein made by you were correct, and whether or not you wish to modify or explain any of them?

[*Objected to by Mr. Hill as incompetent, irrelevant and immaterial, and as new matter not called out by the examination-in-chief, and as matter not between the parties to this suit.*]

A. I think that the answers there made were correct, to the best of my recollection at the time. I don't know that there is anything there that I could wish to modify. I could look over it, but it would take a good while to look over it.

Cross-Q. 1481. I prefer to have you look over it and to take the necessary time for doing so, unless you are perfectly well satisfied to let the matter stand on the answer which you have already given.

[*Same objection.*]

A. I would look over it to-night, after going home, if you will permit me to do so. I have a copy at my shop.

[*Counsel requests him to do so.*]

Cross-Q. 1482. You have spoken of a machine, which you have at your shop, for wrapping or covering wire. Did you make that machine yourself?

A. Yes, sir.

Cross-Q. 1483. State, as nearly as you can, when you made it?

A. It may have been 1869 or 1870, that I made it, and then I made changes—modified it. That was about 1872 to 1874, that I modified it or made changes in it. That is as near as I can remember.

Cross-Q. 1484. Will you give a general description of the machine, as it was after your final changes?

[*Objected to by Mr. Hill as irrelevant and immaterial.*]

A. Yes, sir; as near as I can describe it. It was composed of a wooden frame resting on four feet. The frame or base had two feet, about two feet long and eight or ten inches wide. On the one end of the frame was secured a wooden head projecting up perhaps eight or ten inches, from the bottom or base of the frame. Through said head, near the top, passed an iron tube, about, between a quarter and a half inch in diameter. The tube was perhaps five or six inches long. On that tube was placed a face-wheel of wood, about seven or eight inches in diameter, and about half an inch thick at its edge—somewhat thicker at the hub—the face-wheel: that is, the hub was formed into a hub-pulley for the reception of a cord for driving the face-wheel. On the side of the face-wheel were two metal studs, for reception of two bobbins, which contained the material for covering the wire. On the ends of the studs were placed thumb-screws and tension springs, for giving a proper tension to the bobbins. A little way forward of the face-wheel, immediately in front of the tube, were two wooden feed rollers faced with soft rubber. Those rollers were for the purpose of feeding the wire at a proper speed, when being insulated. Both the face-plate and feed rollers were driven by an iron shaft having pulleys thereon, one for driving the face-plate and another for driving the feed rollers. The pulleys for driving the feed rollers were cone pulleys. The iron shaft above mentioned was driven by a foot treadle. That is about as near as I can describe it.

Cross-Q. 1485. You have described a fire alarm apparatus, which you constructed. What features of that apparatus were your own invention?

[*Same objection.*]

A. The composition that I used was zinc and wood; and in another I used brass and zinc, to produce the vibration or movement, which was caused by the degree of heat. I considered that as my invention. I had never seen or heard of it before.

Cross-Q. 1486. Did you consider your invention to rest in the combination of two different materials, or in the special combination of the particular materials which you used?

[*Same objection.*]

A. It occurred to me that if I used a combination of that kind placed into a room, when the room would come to a certain degree of heat, it would cause this composition to move, and form a circuit with a battery, and an alarm. I got up the apparatus and tried it in the shop. Having not heard of it before, I considered it a new invention.

[*Question re-read to witness.*]

I don't know. I had tried it in two ways. First I tried it in wood and zinc; then in zinc and brass—any two dissimilar metals. That is, any two that would expand and contract different under the same heat, would answer the same purpose.

Adjourned until February 16, 1882, at ten, A. M.

February 16, 1882, ten A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 1487. Have you ascertained, since the adjournment, the date of the issue of the copy of the Patent Office laws and rules which you have?

A. Yes, sir; I brought them over. I had to hunt a good deal for them. Patent laws of August, 1876, and the rules, August, 1876. Here is Munn & Co.'s Patent Law Compendium of 1867.

Cross-Q. 1488. Have you, since the adjournment, ascertained any further facts in regard to the purchase of pipe for rams, and as to the persons for whom you put in rams?

A. I have reflected, but I couldn't think of any others. I couldn't get at the prices, though I hadn't as much time last night as I expected. When I got home the neighbors had gathered at my house and had a prayer meeting. They requested me to be present, and I could not decline. I did make search for bills, of which I had a number. I found a few bills, which I have in my pocket. There were some older bills—quite a number of them—but I didn't have time to search sufficiently.

[*By consent, the following copies of said bills are put in evidence, the originals to be produced when called for:*]

"Philadelphia 5 mo, 14, 1878, Mr. Daniel Drawbaugh, Eberly's Mills, Cumberland County, Penna., bought of Morris, Tasker & Co., Limited, (mkd Harrisburg, Pa.)

144 lbs.	1 Bdle ½ Pipe 172,	.07	12.04"

"Philadelphia, 7, 1, 1878, Mr. Daniel Drawbaugh, Eberly's Mills, Cumb. Co., Pa. Bought of Morris, Tasker & Co., Limited. Mkd Marysville, Pa,

2 Bdles ½	"	Pipe 200,	.07	14.00	
165 lbs.		55 per cent. & 2 per cent.		7.82	6.18"
P. R. R.					

"Philadelphia, 11, 14, 1878, Mr. Daniel Drawbaugh, Eberly's Mills, Cumb. Co., Pa. Bought of Morris, Tasker & Co., Limited. Mkd Harrisburg, Pa.

1 Bdle ½ "	Pipe 172	.07	12.04	
144 lbs.	55 per cent.		6.62	5.42
	2 per cent.			.10
				$5.32

Cross-Q. 1489. Do you remember putting in a ram for a man by the name of Harry Neidig?

A. Yes, sir.

Cross-Q. 1490. Do you remember when it was and the price?

A. I don't remember the time nor the price.

Cross-Q. 1491. Where did he live?

A. He lived on the road to Shiremanstown, at a place called Rupp's Spring.

Cross-Q. 1492. Did you put one in for Harry Peters? If so, when and what was the price?

A. I don't remember putting in one for Harry Peters. I don't know a man by that name.

Cross-Q. 1493. Did you put one in for anybody at Oyster's Point?

A. William Stephen; I think I mentioned that. It was at Sporting Hill, abount a mile and a half further up the pike than Oyster's Point.

Cross-Q. 1494. Do you remember putting in a ram for a man by the name of Rupp, one named Scheibley, and one Craig?

A. No, sir; I don't remember putting in one for Rupp. There was one put in for Scheibley, who was Associate Judge in Perry county at one time. The fall of water was not sufficient, and he would not keep it, but the ram was left there and has never been used. I will reflect more about Rupp, but, as now, I don't remember. I can't remember of putting one in for Craig.

Cross-Q. 1495. When did you put in Scheibley's ram, where did you get the pipe for it, and how much did Mr. Scheibley pay you?

A. I can't state when it was. It was a number of years ago. It might have been as far back as 1874, 1875, or a little longer. I think I got the pipe from Morris, Tasker & Co. I won't be positive. I think he paid on the account twenty dollars, to the best of my recollection.

Craig was one man you mentioned—I ain't positive of the name, but there was one put in in Perry county, at Newport. I think Craig was the name. I ain't too positive. Johnson Leonard was along. He had seen these parties before the rams were put in. He was present when I put in the Scheibley ram, and Craig. The amount of that ram I don't remember. I don't think it was paid immediately after the ram was put in. Leonard afterwards made a collection and paid me some.

Cross-Q. 1496. Have you examined farther your deposition in the Interference case, to which your attention was called yesterday?

A. I did. I read part of it. As I mentioned before, it was late when I got home. I read a portion of it, but didn't finish it.

Cross-Q. 1497. Will you complete the reading of it, and then state whether you find any occasion to modify or explain any part of of?

[*Mr. Hill makes the same objection to this question that he made to a similar questian yesterday.*]

A. Yes, sir; I will read it. (*Witness reads the deposition and then says:*) I do not find anything there to modify. It was given, to the best of my recollection, at that time.

[*Counsel for Plaintiffs now offers in evidence the printed copy of the deposition of D. Drawbaugh, from the printed book of evidence, which the witness has examined, to be marked "Interference Record, D. Drawbaugh Deposition."*]

[*Objected to by Hill, as incompetent, irrelevant, and immaterial—a deposition given in a matter between other parties than the parties to this suit, and the contents of which were not referred to in the examination in chief.*]

Cross-Q. 1498. Will you look at the preliminary statement on the first, second, and third pages of the record, which has just been produced, and which purports to be sworn to by you before George Kunkel, N. P., on the 30th day of April, 1879, and state whether or not, according to your present recollection, the statements therein contained are true, and whether you wish to modify or explain them, or any of them?

[*Same objection to said preliminary statement and cross-examination thereon as to said deposition and cross-examination thereon.*]

A. I believe them to be true, and do not wish to modify any of them.

[*Counsel for Plaintiffs now states that he offers in evidence that part of the record entitled a preliminary statement, which has just been shown to the witness. He also offers in evidence the depositions of the remaining witnesses in the* *exhibit, whose names are as follows: Jacob E. Shettel, Henry F. Drawbaugh, Samuel M. Hertzler, William C. Diven, William S. Dellinger, Jacob Evans, William Fettrow, Henry S. Rupp, Abraham B. Shank, Daniel Fettrow, Ira D. Kahney, John B. Drawbaugh, John C. Smith, John W. Moffitt, George W. Phillips, Edgar W. Chellis.]*

[Defendants counsel objects to the introduction of said preliminary statement and the depositions just offered in evidence upon the same grounds mentioned in the objections to the introduction of the deposition of Danel Drawbaugh; and upon the further ground that said printed copies are not properly verified or proved to be accurate copies of the original depositions on file in the Patent Office. And Defendant's counsel gives notice that he shall decline to put his clients to the expense of re-printing this record of 140 *printed pages, which, so far as he can see, has no possible relevancy to this case.]*

Recess for dinner until 2 o'clock, P. M.

February 16, 1882.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Storrow continued:

Cross-Q. 1499. I notice that the copy of Munn & Co.'s circular, which you have produced, bears date 1867. How long have you had it in your possession?

A. I don't know. I don't remember how long—a number of years. The number I couldn't state.

Cross-Q. 1500. Will you give this copy to the examiner, to be marked as an exhibit in this case?

A. Oh, yes; I have no objections

[Circular now produced, marked "Exhibit Munn & Co.'s Circular."]

[Objected to by Mr. Hill as immaterial and irrelevant, and the same notice is given as to printing, as was before given with reference to the interference depositions.]

Cross-Q. 1501. Have you in your possession copies of the specifications and drawings used in the applications for patents in telephones, that you made in July, 1880? If, so, will you produce them as exhibits in this case?

A. I ain't certain that I have the copies of specifications, I have the drawings; I think—I know I have, and I can bring them in the morning, if necessary.

[*Mr. Smith requests the witness to produce such copies, as he has, to-morrow morning.*]

[*Defendant's counsel objects to the introduction of such applications or copies thereof in this cause, and states that, subject to the orders of the Court, he declines to permit their introduction and use, for the reason that said applications are on file in the Patent Office, and, by the statute, and rules of practice of the Patent Office, are ex parte matters not accessible to the public; and for the further reason that, if produced, they would be immaterial to this cause, and that they cannot properly be called for in cross-examination, because not a subject of the examination-in-chief.*]

[*Counsel for Plaintiffs now requests the counsel for the Defendants to produce copies of the specifications and drawings of the applications for letters patent on the witness' electric speaking telephones, referred to in the* 373*rd and* 374*th direct interrogatories, on pages* 856 *and* 857, [823] *of the record, or to give the counsel for the Plaintiff's certified copies of the same, or an order upon the Commissioner of Patents to furnish them with such copies at the expense of the Plaintiffs.*]

[*Defendant's counsel replies that he has not put in evidence said applications, nor proof of their contents, nor examined the witness, except as to the bare fact that he made applications in July,* 1880*; that, when he asked the witness those two questions, Complainant's counsel objected to both interrogatories as immaterial, which objection the Defendant's counsel then considered, and now considers, good; and Defendant's counsel, subject as before stated, to the order of the Court, declines to allow the cross-examination to take so wide a latitude as to require the production of papers which are in the secret archives of the Patent Office, and which, if produced and published in this cause, would possibly invite the filing of contesting applications and result in interference and additional litigation; besides unnecessarily prolonging the taking of testimony here and increasing the expenses.*]

[*Counsel for the Plaintiffs further requests counsel for the Defendants to procure copies of the specifications and drawings of the applications filed in the Patent Office, for letters patent on the inventions of Daniel* Drawbaugh, *referred to in the* 14*th section of the answer of The People's Telephone Company, in this cause, on page* 9 *of the Defendant's record, or to give them certified copies of the same, or an order on the Commissioner of Patents to furnish them with such copies at the expense of Plaintiffs.*]

[*Defendants' counsel replies that he will take the request into consideration, and give Complainant's counsel an answer to it, in time for the Complainant's connsel, if the request shall be granted, to put said specifications and* *drawings, or copies thereof, in evidence, during the taking of Complainant's rebutting evidence, or prior to the close of the taking of testimony in this cause; but Defendant's counsel declines to produce, or put said papers in evidence, for the pnrposes of this cross-examination, for the reasons above given; and Defendant's counsel further says that he has no copies of said papers, and would would be obliged to apply to the Patent Office for them, except that he may have, possibly, at his office in Chicago, photo-lithographs of the drawings, or some of them.*]

Cross-Q. 1502. Mr. Edgar W. Chellis, a witness who has been produced on behalf of the Defendants, testifies that you showed him various talking machines in the year 1879. At the time when you first showed him any of your machines, did you show him all which you had made before that time?

A. I don't remember. He seen apparatus standing there in the shop, and I suppose I showed him some, but I don't remember which I showed him. He may have seen them all.

Cross-Q. 1503. At the time Mr. Chellis commenced going to your shop, and for a year or two previous to that time, where were the various talking machines kept which you had made before that time?

A. In various parts of the shop. In the small private room some of them were kept. Some were in the wood working room, and some of the machines were in the room we termed the clock-room.

Cross-Q. 1504. Which of the machines were kept in the clock-room before Mr. Chellis commenced going to your shop?

A. I don't know whether I can know them, unless I see the drawings. There were various machines there, and sometimes they weren't there all the time. (*Witness looks over the drawings, and says:*) Instruments "G" and "H" was there, sometimes, and "P" and "J," and different other ones. Likely, nearly all had been there part of the time, or sometimes.

Cross-Q. 1505. Did you have to make any special search for any of these instruments, which have been produced in evidence, or any parts of them, at the time you first showed them to Mr. Chellis, or to the counsel, Mr. Hill and Mr. Jacobs?

A. I don't remember that I did. I think not. But afterwards I made search for different parts. I don't suppose they seen all the different machines; that is, complete.

Cross-Q. 1506. When did you afterwards make the search and when

LEPHONE COMPANY,-2

did they first see all the machines complete as they have been produced in evidence?

A. I couldn't state the time. That is, the dates I can't give. I don't remember that I made a search to show those gentlemen the machines. The search was made for parts of machines, about the time the suit pended.

Cross-Q. 1507. You mentioned previously a machine which the Clock Company procured for winding coils of electro-magnets. Did you make that machine?

A. No, sir.

Cross-Q. 1508. Where was it procured and what kind of a machine was it—give a description.

A. It was procured in Philadelphia. The dealer it was procured from I don't remember the name of. I could ascertain that, too, if it is necessary. It was termed a small engine lathe.

Cross-Q. 1509. Was it used for other purposes than winding coils, and if so, for what purpose?

A. Yes, sir. It was adapted for all manner of small turning—brass or iron and metals of different kinds.

Cross-Q. 1510. Who made the various reproduced instruments, which have been produced in evidence, and when were they made?

A. I made some, and my brother, J. B. Drawbaugh, made some. Some of them were made during this last summer, and some of them were made a year, or a little over a year ago, as near as I can remember.

Cross-Q. 1511. Did George Drawbaugh do any work on them?

A. I think perhaps he did, on some of them.

Cross-Q. 1512. In your answer to the 365th interrogatory, you speak of showing M. W. Jacobs instrument "K" in the spring or summer of 1879. When did you first show him any of the instruments which have been produced in evidence, and how many of them did you show to him in the spring or summer of that year?

A. I showed him instruments at the time that Hauck interference suit was pending, or prior to the time of taking testimony in that suit. I hadn't remembered the time. I had referred to Mr. Jacobs for the time. I had forgotten the time.

Cross-Q. 1513. What work were you doing on talking machines in the winter, spring and summer of 1879. What instruments were you working on, if any?

A. I don't remember just what ones—different ones. One was termed, that I was experimenting on—that is, I termed it—the cone transmitter.

Cross-Q. 1514. That instrument has not been put in evidence, has it?

A. No, sir.

Cross-Q. 1515. Can you mention any other instrument which you were at work on during that time?

A. That one that is a frictional machine, I worked on. I don't remember distinctly the time. That may have been before or after that time. I would often take up those machines, after they were made, at different times, and try them—experiment with them. I was nearly constantly working at some of those different instruments.

Cross-Q. 1516. Do you remember a visit which James P. Matthews made to your shop in April, 1878, the editor of the *Baltimore American?*

A. I hadn't remembered the name. There was an editor visited my shop. I don't remember the time, but it was about that time, as near as I can judge.

Cross-Q. 1517. Did you afterwards receive one or more copies of the *Baltimore American* containg an article which he wrote relative to his visit?

A. I don't remember of receiving a copy of the paper. He sent me a slip of some paper—I don't remember what paper it was—containing an account of the visit—a column or a column and a half. He may have sent me a paper, but if he did I have forgotten it.

Cross-Q. 1518. Will you look at an article purporting to be from the *Baltimore American* of November 28, 1878, on pages 99, 100, 101, and 102, of the printed record of the Plaintiff's evidence, filed on the motion for an injunction in this case, and state whether or not you remember that, as the article that Mr. Matthews sent you?

[*Witness reads the article.*]

A. I think that is the article, as near as I can remember. I remember of reading an article of that kind.

Cross-Q. 1519. Will you say, whether or not, according to the best of your recollection, the statements in that article, relating to the interview, are correct?

A. They are not correct, no. The description, I see there, of the clock isn't according to the plan of the clock. I don't say that he intentionally give a wrong description, but I don't think he understood it properly; and in describing a telephone—I showed him a telephone—he got the idea of a telephone that worked by a musical scale and alphabet. I never had anything of that description. I am confident of that. I think he was confused with some of the different apparatus. I may have shown him an alphabetical telegraph, and that, perhaps, he had confused with some other apparatus. In describing a clock, he speaks of a permanent magnet fastened to the back or wall of the clock, and that the electro-magnet was suspended at right angles to the permanent magnet. That was not the case. The electro-magnet was fastened to the back of the clock, and the poles of the permanent magnet were exactly opposite. They were not at right angles. It would not produce any motion arranged in that way. The permanent magnet was secured to the pendulum—and were not at right angles—that is, the poles of the permanent magnet and electro-magnet were facing or opposite each other.

Cross-Q. 1520. Have you mentioned all the statements which you think are incorrect in the article?

[*Witness reads the article again.*]

A. It is wrong in one particular here again. I will just read:

"The pendulum receives an impulse at each stroke, which keeps up a continuous motion, and this impulse is derived from the alternate attraction and repulsion of two magnets, and the existence of 'a neutral line,' at which the one pole loses its power and the other begins to act."

That is not the case. In that clock the two poles—that is, all the poles—lose their power at a certain portion of the stroke. That is, one pole could not lose its power and not the other. That would not be correct there. I will again read:

"The wires attached to the poles of this magnet are not in sight, but they run down to the ground, each terminating in a copper plate, about two feet below the surface; thus the earth becomes the battery that feeds the electro-magnet."

They do not terminate in two copper plates. It is a copper and a zinc. It would not become a battery, with two copper plates.

There is another mistake here:

"He has patented several useful agricultural and mechanical machines."

I have never patented any agricultural machine.

I will mention, I do not like to criticize too much. I don't think it is quite just. It was a friendly visit, and I think he was ignorant of some of those expressions here.

Cross-Q. 1521. I wish you to mention all the statements, which you think are erroneous, whether you think it just to do so, or not. If there are any other statements, which you think are erroneous, please point them out?

A. Here is, I suppose, a little mistake. I don't suppose it was intentional either.

"He never expected to send articulate sound over a magnetized wire."

That would be erroneous there. That is all.

Cross-Q. 1522. What telephone did you show him while he was at your shop?

A. I don't remember. If I remember rightly, he was more interested in the clock. He didn't stay long, to the best of my recollection. He may have been there in the neighborhood of an hour. I remember of speaking to him about the clock, but I don't remember of speaking to him about any other instrument.

Cross-Q. 1523. Will you now read the affidavit of Mr. Matthews, on pages 97 and 98 of the record I previously referred to, and state whether or not the statements in that, with respect to what you told him, are correct or not, and point out any errors you may think you discover in such statements?

[*Defendant's counsel objects to this evident effort to force upon the record, as a part of the evidence in this case, the ex parte affidavit of a person whom the Defendants have had no opportunity to cross-examine, and objects to the introduction of the affidavit as incompetent and hearsay; and objects to the attempt to establish it, or any part of it, by any evidence except that of Mr. Matthews himself, duly called and examined for the purpose.*]

A. I won't say as to the statements—portions of it may be correct. The affidavit says: "He showed me two hollow hemispheres, which constituted a part of the apparatus."

Now, I am confident I never had any instruments got up in that way. I am perfectly positive. I didn't have instruments constructed in that way. I may have shown telephones. I don't remember of speaking on the subject of telephones. I don't remember.

He further states here:

"There was no telephone on his premises at that time, as far as I could see, and he made no mention of having any such instrument, except the detached pieces above mentioned.

He said that the idea of transmitting sounds in this manner was not new, and that he had, some years before, read of it in a scientific publication translated from the French."

ELEPHONE COMPANY,-2

I had read of an apparatus, that was termed—I didn't know at the time--the "Phonautograph;" that I read of in some publication that was translated from the French. But I don't remember of making the statement. If I did, I have forgotten it. What I mean by translated from the French is, that it was a French invention—invented by some French party.

Cross-Q. 1524. Have you mentioned all the statements referred to in the last question, which you think are incorrect?

A. I don't see why I should have made those statements to him when I knowed at the same time that I had telephone apparatus that numbers of others had seen. I don't see why I would have made that statement. That is what makes me think I didn't make that statement.

Adjourned until February 17, at ten o'clock, A. M.

February 17, 1882, 10, A. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

[*Complainants counsel now offers the examiner the printed sheets, to which the attention of the witness has been called, numbered* 97 *and* 98, *from the printed record of the evidence on the motion for the preliminary injunction in this case, containing the affidavit of James P. Matthews, to be marked "Exhibit Mathews' Affidavit." Also the article from the Baltimore American, to which the attention of the witness has been called, on pages* 99, 100 *and* 101, *of the same record, to be marked "Exhibit Matthews' Article."*]

[*The affidavit and article are severally objected to for the reasons already indicated in the objections of yesterday. And the article is further objected to as entirely secondary in character, it not being an original memorandum of the alleged visit, made at the time thereof, but confessedly written eight months after said visit, and containing the writer's loose impressions remaining after that length of time.*]

Cross-Q. 1525. Do you remember a visit being made to your shop in the spring of 1878 by Dr. John C. Long and Clarence D. Rockafellow?

A. I remember of a visit being made—I didn't remember the time—by Clarence Rockafellow and a gentleman—I didn't remember the name.

Cross-Q. 1526. Will you look at the pages 165 and 166 of the printed record, in the motion for the preliminary injunction already referred to, containing what purports to be an article from the *Independent Journal*, of Mechanicsburg, of the date April 17, 1878, and an affidavit of Mr. Clarence D. Rockafellow, and state whether the article gives a correct account of what you showed to Mr. Rockafellow, and of the information which you gave to him, and whether his statements in his affidavit as to what you said to him are correct or not?

[*Same objection to the affidavit of Rockafellow, and the article referred to therein, as to the affidavit of Matthews, and the article referred to therein. Mr. Hill states that he does not object to the cross-examination of Mr. Drawbaugh as to the matters referred to in said articles and affidavits, so far as they come within the range of the examination-in-chief, but objects to the articles and* EX PARTE *affidavits, or any of them being received as evidence of the alleged facts therein stated.*]

A. I remember of him being there, and that I showed him instruments, but what instruments I don't remember. I know he listened at an instrument while I spoke in a transmitter. I don't remember the nature of the conversation, but that after he had listened he made some remarks and appeared to be perfectly satisfied that the machine was good. I don't doubt I said to him that I was making experiments for the improvement of the apparatus, because I had been, I know, at all the different periods.

[*Mr. Hill reads the following extract from the affidavit and calls the attention of the witness to it:*]

"At that time Mr. Drawbaugh exhibited his telephone to me, on which he claimed to be making experiments, and said that he thought that he had discovered the principles of the telephone prior to Edison, but that he had not as yet made it a mechanical success—and was yet to make improvements on it to make it practicable—a result which he had not yet attained."

Well, I may have said that, because I was working to get louder results. I know I made that remark often, and he appeared to be satisfied with the result—the tenor of his conversation. I don't remember the words.

The remark above referred to as one that I often made was, that I was improving it to get better results.

Cross-Q. 1527. Do you remember whether or not you saw the article which I have shown you on page 165, about the time of its publication, or at any time before the present time?

A. I don't remember at what time. I don't remember of seeing it. There were numerous publications, and I didn't pay much attention to different ones. It is very likely that I did, but the time I don't remember. I mean it is very likely that I seen that publication.

[*Counsel for Plaintiff now offers in evidence the pages* 165 *and* 166, *from the record above referred to, and shown to the witness to be marked "Exhibit Rockafellow Article" and "Exhibit Rockafellow Affidavit."*]

[*Same objection as above indicated.*]

Cross-Q. 1528. Will you look at the affidavit of Theodore Grissinger, on pages 168 and 169, from the printed record of the evidence on the motion for the injunction in this cause, and state whether or not it gives a correct account of the interviews between you, to which it refers, and of what was said?

[*Same objection as to the affidavits of Matthews avd Rockafellow.*]

A. I don't remember any particular conversation. We had a good many on mechanical subjects—about the business and the clock. I know that I felt very reluctant in talking about any other apparatus or machine, except the clock. They were very anxious about the clock business; that is, running that successfully, and I know that I sometimes done work on telephones secretly, that they did not know of, because I judged that they would have complained if they had knowed I had worked on them. We may have had conversations on the telephone, though I never let them out much in that direction. If he had made an inducement that he had been anxious to go into the telephone, I would certainly have shown him and given him satisfaction, I am perfectly sure of that.

[*Counsel for Plaintiff now offers pages* 168 *and* 169, *from the record referred to, containing the affidavit of Theodore Grissinger, to be marked "Exhibit Theodore Grissinger's Affidavit."*]

[*Same objection as to affidavits of Matthews and Rockafellow.*]

Cross-Q. 1529. I now hand you a printed copy of the affidavit of Jacob H. Grissinger, on pages 170 and 171, from the printed record above referred to, and ask you whether or not the account it gives of interviews between you and Mr. Grissinger, and of what you had in operation in your shop while you were connected with him, is correct?

[*Same objection as to the three affidavits already referred to.*]

A. He had visited my shop at a pretty early time, in company with another gentleman, but when they came there they were strangers—I had not knowed them. I had shown him apparatus—clock and different other apparatus, but any particular one I don't remember. Some time last fall, perhaps a year ago—I don't remember the time exactly, but think upon reflection that it was more than a year ago, it might have been last fall a year ago—I met him on the road. He had a ladder. I think he said he was picking apples. I was in a carriage in company with Mr. Jacobs and 'Squire Bowman. We went to get an affidavit from him. He said he had made an affidavit for the opposite party, which he had afterwards seen printed, and it was not according to his statements. The affidavit was not the way he had gave it. He is now dead. He died a month or two, perhaps three, ago. I don't remember that he said he had seen it after it was printed, but he said he had seen it "afterwards."

Cross-Q. 1530. Did he state in what respect the affidavit, which he had subsequently seen, was different from what he had made?

A. I don't remember that he made that statement. I just remember now, that he said it was not as he had given it. Mr. Jacobs and him had the conversation, and he may have stated the difference, but I don't remember that.

Cross-Q. 1531. Who was the gentleman who came with Mr. Grissinger at his first visit?

A. When they come there, they were strangers. They introduced themselves. The one gentleman's name I don't remember. I met the man, after that, several times. I now remember the name. It was Mr. Watts.

[*Counsel for the Plaintiffs' now offer pages* 170 *and* 171, *from the printed record above referred to, which have been shown to the witness, as an exhibit to be marked "Exhibit John H. Grissinger's affidavit."*]

[*Same objection as to the three affidavits above referred to.*]

Cross-Q. 1532. Do you remember a visit being made to your shop, early in 1878, by Mr. Frederick W. Worley and Isaac Lloyd in company?

A. I remember a visit being made to me by Mr. Lloyd, a number of times that he had gentlemen with him, but the names of the gentleman I don't remember, and the time I don't remember. Mr. Lloyd visited me occasionally for quite a while back—a number of years.

Cross-Q. 1533. Will you look at the affidavit of Mr. Worley, printed on pages 172 and 173 of the record above referred to, and state whether you remember the visit of Mr. Worley, which he speaks of, and whether or not his account of what passed between you, and the conversation you had, is correct?

[*Same objection as to the four affidavits above referred to.*]

A. As I stated before, Mr. Lloyd was there frequently and had gentlemen with him, but I don't remember a gentleman by the name of Worley. He may have had that gentleman there, and we may have had conversations on the telephone, but I don't remember that particular conversation. He makes a statement of a kind of a telephone, but I don't remember of having it: "Mr. Drawbaugh stated he was about to render that effect by using a box, or something to which the ear could be applied." I don't understand what he means by that.

[*Counsel for the Plaintiff offers in evidence the affidavit of Mr. Worley, from pages* 172 *and* 173 *of the printed record referred to, which has been shown to the witness, as an exhibit, to be marked "Exhibit Worley Affidavit."*]

[*Same objection as to the four affidavits above referred to.*]

Cross-Q. 1534. Will you look at the affidavit, which I now hand you, of Mr. Isaac Lloyd, on pages 173 and 174 of the printed record above referred to, and state whether you remember the visit, which Mr. Lloyd speaks of in his affidavit, and whether or not his account of what you said to him on that visit is correct?

[*Same objection as to the affidavits above referred to.*]

A. Mr. Lloyd visited my shop frequently, as I said before, in company with different parties, though I couldn't refer to any particular conversation. I don't remember of any particular conversation about the telephone, though I remember of showing him different apparatus, of different kinds, and among them may have been telephones.

[*Plaintiff's counsel now offers in evidence as an exhibit the affidavit of Mr. Lloyd, which has been shown to the witness, on pages* 173 *and* 174 *of the printed record above referred to, to be marked "Exhibit Lloyd Affidavit."*]

[*Same objection as to the affidavits above referred to.*]

Cross-Q. 1535. Mr. Worley and Mr. Lloyd refer, in their affidavits, to an article written by Mr. Worley and published in the *Harrisburg*

Telegraph, Feb. 13, 1878, entitled "The Great Magnetic Clock," and signed "Observers." Do you remember of seeing that article at any time subsequent to its publication? I now hand you a copy of the article, on pages 181 and 182.

[*Same objection.*]

A. I could answer that—there were so many. I don't remember any particular one. (*Witness reads copy*) I may have read it. There were so many different articles published, that I don't remember every article.

Cross-Q. 1536. Will you look at the additional extracts purporting to be from the Harrisburg papers, on pages 181, 182, 183, 184, of the printed record above referred to, which I now hand you, to wit:

One purporting to be from the *Harrisburg Telegraph* of April 18, 1878.

One purporting to be from the *Harrisburg Patriot* of May 7 1878.

One purporting to be from the *Harrisburg Independent* of May 19, 1878.

One purporting to be from the *Harrisburg Patriot* of May 14, 1878.

One purporting to be from the *Harrisburg Independent* of May 15, 1878.

One purporting to be from the *Harrisburg Independent* of May 17, 1878.

State whether or not you remember of reading those articles, or any of them, at the time of their publication, or subsequently?

[*Same objection as to the preceding articles.*]

A. I may have seen the articles. I don't remember.

[*Plaintiff's counsel now offers as an exhibit the extracts from the Harrisburg papers, which have been shown to the witness, on pages* 181, 182, 183 *and* 184, *of the printed record above referred to, to be marked "Exhibits Extracts from Harrisburg Papers."*]

[*Same objection.*]

Cross-Q. 1537. You have spoken of a Mr. Watts, who visited your shop in company with Mr. Jacob H. Grissinger. Did that visit take place about October, 1876, and was that Mr. Watts Mr. William M. Watts, of Shepherdstown?

A. I don't remember when the visit was. I remember the visit

They came there strangers, and introduced themselves. His first name I don't remember.

Cross-Q. 1538. Have you and Mr. Jacobs, or either of you, since visited him, for the purpose of obtaining an affidavit from him to be used in this case, or to get him to testify in the case?

[*Objected to as immaterial, and, so far as any visit of Mr. Jacobs alone is concerned, as calling for hearsay.*]

A. Yes, sir. I called on him, in company with Mr. Jacobs, for an affidavit. He declined giving an affidavit.

Cross-Q. 1539. Did Mr. Watts, at the time of his visit to your shop, say anything to you about having seen an article, or articles, in the *Scientific American*, in regard to transmitting sounds?

A. I don't remember. He may have.

Cross-Q. 1540. Do you remember saying anything to him, or intimating to him, that you had seen such article or articles, and that you had been experimenting?

A. I may have said it. I don't remember. I wasn't a subscriber to the *Scientific American.* I very seldom seen a copy. Them conversations were so very varied and I spoke on so many different subjects that I don't remember any one particular subject.

Cross-Q. 1541. Do you remember whether or not you showed him a tumbler with the bottom broken off, and explained to him that it had a diaphragm of bladder tied on to it, and producing a clock spring, or piece of steel, and trying to explain to him the action of the apparatus by means of the piece of steel?

A. I wouldn't now—in using a clock spring or piece of steel, I couldn't form any connection, why I would use that in explanation. I may have shown the tumbler with the bottom out, and I may have shown him other instruments. I don't remember what instruments I showed him. I never used a clock spring in connection with any telephone instruments that I can remember of.

Cross-Q. 1542. If you showed him a broken tumbler, was it the one which has been produced here as exhibit "F?"

A. It may have been—yes.

Cross-Q. 1543. Do you remember whether you ever met Mr. Watts at any time in Mechanicsburg, and having any talk with him upon the subject of sound?

A. It occurs to me that I met him when I lived in Mechanicsburg.

I think he was going to the Centennial. That was what makes me think that that visit to my shop was at an earlier day than given in the previous question, because; when he came to the shop, that was the first time I knew him. He introduced himself and Grissinger. He made mention that he would like if I would go along with him to the Centennial. That meeting I remember, because I was anxious to go to the Centennial, and I hadn't been there yet, at that time. I don't remember the subject of conversation, except that portion of it. He asked me to go to the Centennial. That portion of it I remember. He may have spoke on the subject of sounds.

Cross-Q. 1544. Do you remember whether you said anything to him about some observations that you made at one time on the vibrations of sounds, while your daughter was playing on some musical instrument?

A. I don't remember of making that, but I remember of making that observation to a number of persons, that a sound would be reproduced on a window pane.

Recess for dinner until 2, P. M.

Feb. 17, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Daniel Drawbaugh by Mr. Smith continued:

Cross-Q. 1545. You have referred to there being numerous publications in the newspapers. Do you know of any other articles published in the newspapers relating to a clock or other inventions, except those to which I have called your attention. If so, in what papers were the articles published, and when?

A. There may have been others, likely there was. I can't just refer you to any. I don't remember.

Cross-Q. 1546. Have you now any recollection of seeing any other articles except those to which I have called your attention?

A. I have no recollection of seeing any other.

Cross-Q. 1547. In looking into the bottom of exhibit "M" I notice some holes or depressions cut into the wood between the permanent magnets. What were they for?

A. These magnets at one time stood apart—were wider. There was a tube inserted between them, operated by a screw—to compress, or to

LEPHONE COMPANY,-2

raise that tube. In the tube were carbons in combination with the electro-magnets—in their place. And I think that the magnets were just turned opposite. And them holes were impressions allowing the heads of the screws to clear themselves, that the permanent magnet would rest close to the bottom. I think that was the arrangement. I don't know what else they were for.

Cross-Q. 1548. When the electro-magnets were turned opposite, and separated in the manner you have described, were the permanent magnets now in the instrument, then in it?

A. My experiments were so varied that I sometimes used permanent magnets that were not turned up. And in some of the same cases I put other magnets. They may not be the same permanent magnets.

Cross-Q. 1549. Did you use the same electro-magnets now in the instrument, in the manner you have stated, in the first situations you have described?

A. I think so. To the best of my recollection I did. What makes me think that is, that there is a part of the spool cut away at the inner edges—for the tube between did not have room.

Cross-Q. 1550. I notice that a portion of one of the bills you produced yesterday, of Morris, Tasker & Co., dated 14th day of the 5th month, seems to have been cut away, so as not to show the discount as on the other bills. When and why was that done?

A. I can't tell you. I didn't know it was cut away. That is the first time I knowed it was cut away. I don't know why it was cut away, nor when it was cut away.

Cross-Q. 1551. Will you look at the pages of the printed record, of the evidence on the motion for an injunction in this case, from 103 to 117 inclusive, which I now hand you, purporting to be certified copies of the file-wrappers of various patents granted to Daniel Drawbaugh, and state whether the patents mentioned are those which were granted to you?

A. Yes, sir. They are.

[*Complainants' counsel offers as an exhibit the pages from the record referred to in the last interrogatory, to be marked " Exhibit Drawbaugh Patents."*]

Cross-Q. 1552. Mr. Edgar W. Chellis, a witness called for the Defendants in this case, testifies that, on or about the 6th day of May, 1880, Mr. Hill, Mr. Jacobs, and himself became interested in your telephone inventions to the extent of about one quarter each. What did you then receive, or what were you thereafter to receive, as the consideration for those interests in your invention which you gave to those parties?

[*Objected to as immaterial.*]

A. I think I have a right to decline answering that. It is a private business, which I don't wish to have known.

Cross-Q. 1553. In an assignment, which has been put on record in the Patent Office, from you to Frank A. Klemm, Ernest Marx, Simon Wolf, and Moritz Loth, executed on the 21st day of July, 1880, and which Mr. Chellis says, in answer to the 83d interrogatory, was, he supposes, in effect, to carry out the sale or bargain made by himself and three associates, there is a recital that in consideration of the sum of twenty thousand dollars, paid to you in hand, "the receipt of which is hereby acknowledged," you sold, assigned, and transferred the interests to the parties I have named. Did you, at that time, receive and keep for your own use the sum of twenty thousand dollars?

[*Objected to as irrelevant and immaterial, and as the witness' private business.*]

A. No, sir; I did not.

Cross-Q. 1554. How much was paid at that time, and how much did you keep for your own use?

[*Same objection.*]

A. The amount, if I remember right, was twenty thousand dollars. That is taking advantage. I gave an answer and declined giving the amount. Really, I think it is not just to ask me my private business. I decline giving the amount which I received.

Cross-Q. 1555. Did you receive any other consideration than the twenty thousand dollars, or were you thereafter to receive any further consideration, either in money, or in the stock of any Company, or in any other way?

[*Same objection.*]

A. I didn't receive anything else at that time. I was to receive thereafter, but the amount I decline giving, for the same reason, that I think it is private business.

Cross-Q. 1556. In what way were you to receive it, and have you now received what you were to receive?

[*Same objection.*]

A. I was to receive it in stock, and have received stock.

Cross-Q. 1557. Stock in The People's Telephone Company?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1558. Have you received all the stock that you were to receive?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 1559. State what amount of stock in The People's Telephone Company you have received, and how much you now hold.

[*Same objection.*]

A. I decline answering, for the same reason.

Cross-Q. 1560–1. The interest which you have in the result of this suit is a matter which concerns the Plaintiff, and it has a right to know what that interest is. I, therefore, repeat the question: What amount of stock have you received of The People's Telephone Company, and how much do you now hold?

[*Objected to on the ground that the Plaintiffs have only the right to know whether or not the witness is interested to a considerable extent in said stock, but have no right to the details.*]

A. I stated before that I received stock, but I decline answering the amount, as I consider it private—the amount.

[*Counsel for the Plaintiff here give notice that they do not waive their right to an answer to the last question, or to any of the preceding questions that the witness has declined to answer; that they now insist upon an answer, and shall insist that the consequences of this refusal shall be borne by the Defendant.*]

Re-direct examination by Mr. Hill:

Q. Q. 1562. You may state whether or not you are interested in said stock to a considerable amount, if you have no objection to answering that question.

A. I have no objection to answering that. I have stock to a considerable amount.

Q. Q. 1563. You may state further, whether the holding of that stock has or has not, in any way, influenced the testimony which you have given, or may give in this case?

A. I don't properly understand that question.

Q. Q. 1564. What I mean is this, whether or not the interest, which you have in the result of this suit, in any way affects the testimony which you as a witness have given, or may give?

A. There is where I don't know how to answer that. I may be dull in that, but I don't know.

Q. Q. 1565. I will try to make it plain. You are a stockholder in The People's Telephone Company. Is your testimony as a witness just the same as it would have been if you had not been a stockholder, or has your interest caused you to give more favorable testimony for the Defendants, than you would have given if you had not been a stockholder. That is what I mean.

A. As a stockholder my evidence is the same as it would have been if I had not been a stockholder. I tried to give in my testimony as near as I knew, in accordance with justice. And I know that I wasn't influenced to make any wrong statements from the interest that I received from the Company.

Q. Q. 1566. You have testified to having in your possession a copy of the Patent Office rules and regulations of 1876. Do you know when you first received that copy?

A. I do not.

Q. Q. 1567. Do you remember whether or not you received it during the progress of the Drawbaugh and Hauck interference, and in connection therewith?

A. No, sir. I don't remember when I received it.

Q. Q. 1568. Do you remember when you received a circular of Munn & Co.?

A. No, sir. But my impression is, that I had that for a number of years. It was lying among a lot of old papers and trash that hadn't been looked over for a great while, I know.

Q. Q. 1569. In what years were you a subscriber for the *Scientific American?*

A. I could hardly state in what years. I hadn't been a subscriber for twelve or fifteen years, until about three or four weeks ago, when I subscribed with a newsdealer here in Harrisburg.

Q. Q. 1570. Do you remember why you let your old subscription run out without renewing it?

A. Yes, sir; for the want of money. At the time it did run out it was for want of money, thinking I would renew it. But it seems I didn't. It was for that reason, I know.

Q. Q. 1571. When Mr. Matthews visited your shop in April, 1878, did he come there at your invitation or procurement ?

A. No, sir. I didn't, though, remember what year. When he came there, he didn't come by invitation.

Q. Q. 1572. Had you been acquainted with him before that ?

A. No, sir.

Q. Q. 1573. Do you know how he happened to come there ?

A. I do not.

Q. Q. 1574. Did he state what he came to see ?

A. I don't remember that he did. He was interested in the clock. He looked at the clock. I remember that fact.

Q. Q. 1575. What were you doing when he came there ?

A. I don't remember what I was doing at the time.

Q. Q. 1576. Was anybody else present during his interview ?

A. I think there was a boy that brought him to the shop, who was present part of the time, at any rate. I don't know whether he was present all the time or not ; and there may have been some one working in the shop, besides myself.

Q. Q. 1577. Do you remember whether the Magnetic Clock Company was in operation at that time at the shop ?

A. I don't remember that, but it seems to me it was before. It seems quite a while since he was there. But I won't be positive whether it was during the time the Clock Company operated, or not ?

Q. Q. 1578. Were you with him all the time while he was in the shop ?

A. I don't remember that. I may have been with him all the time.

Q. Q. 1579. Did he tell you that he was a newspaper man ?

A. I think he did.

Q. Q. 1580. Did he make any notes or memoranda while he was there ?

A. Yes, I remember that. He did.

Q. Q. 1581. Did he read them to you ?

A. No, sir.

Q. Q. 1582. Did you know on what subject the notes or memoranda were made ?

A. I don't know exactly, but he had a memorandum book when he was in front of the clock. He was examining the clock, and he took down some notes.

Q. Q. 1583. Did you have any conversation with him about the clock or motor of Mr. W. W. Gary, of Boston?

A. I don't remember. He spoke of different subjects, but I don't remember that he mentioned Gary or any motor. He may have, but I don't remember.

Q. Q. 1584. Assuming Mr. Matthews' visit to have been in April, 1878, which ones of the several telephone instruments that have been put in evidence here, had been made and operated by you before that time?

A. I will have to look over the drawings. "B" and "A," "C," "D," and "E"—the magnetos—"F," "G," "H," "I." I wouldn't be positive as to the frictional machine, "K." "J" was complete; "L" and "M;" "N;" I wouldn't say positively as to "Q;" "P," I think.

Q. Q. 1585. On what subject was the most of Mr. Matthews' conversation during that visit?

A. As near as I can remember now, on the clock.

Q. Q. 1586. Do you recollect of showing him any other machines of your invention, besides the clock?

A. I don't particularly remember, but it is likely I did.

Q. Q. 1587. Did you show him your faucets?

A I may have, but I don't remember that I did.

Q. Q. 1588. What time of day was it when he came there?

A. I don't remember that. I rather think it was in the afternoon, but I wouldn't be positive.

Q. Q. 1589. In what part of the shop was the interview?

A. In the part where the clock was. I think it was in the clock-room, though, before there was a partition run lengthways through the shop. I think so, but I won't be positive.

Q. Q. 1590. Did you ever make or experiment upon a machine for transmitting and understanding messages by variations of tone and pitch.

A. No, sir; I never did.

Q. Q. 1591. Did you ever make or experiment upon a machine for transmitting letters of the alphabet by variations of tone and pitch?

A. No, sir; I had made an electric apparatus for transmitting words by letters of the alphabet. That was a magneto-electric machine, but not for transmitting by tones or pitch.

Q. Q. 1592. Do you recollect whether you showed him that magneto-dial telegraph?

A. I don't remember that I did. I may have.

Q. Q. 1593. You testified in your cross-examination, that you had, prior to that time, read somewhere a description of the French machine, called the "Phonautograph." Is it your recollection that the description was clear enough for you to understand the nature and mode of operation of the "Phonautograph"?

A. Yes, sir; there was a cut illustrating it, and a description.

Q. Q. 1594. If you remember, please give me an idea of the construction and mode of operation of that "Phonautograph," as it was there described?

A. I will try, yes, sir. I could give a better idea if I make a sketch.

[*Witness makes a sketch, and then answers:*]

In making the sketch—it has been a great while ago since I seen the original drawings, and it may not be correct in every detail, but the general principles are correct.

AA are supports, or a frame for carrying a cylinder, B; at one end of this cylinder is attached a tube, C; the outer end of the tube, C, is provided with a thin membrane, D; in the centre of said membrane was attached a thin cord, or silk fibre, which run through the tube and into the cylinder B, and was attached to a right-angled lever, F; said lever was secured to a bracket upon a shaft, G; the upper end of said lever—that is, the end that stands parallel with the edge of cylinder B—carried a fine tracer, H. In the interior of the cylinder was placed paper—that I could not draw in there—which was smoked by a lamp, and nicely secured to the inside of the cylinder. The cylinder was revolved by clock movements. These I have not made any sketch of. Any sounds made in the neighborhood of the diaphragm caused the membrane to vibrate, which communicated the vibrations to the right-angled lever, F, which would record the vibrations on the surface of the paper. There was a mode explained of making the traces indelible by soaking the paper, after taking it out of the cylinder, in a tray that contained gum water. I think the cylinder B inside was coated with plaster-of-paris.

Adjourned until Feb. 18, 1882, at ten, A. M..

Feb. 18, 1882, ten, A. M.

Examination resumed.

Present same counsel.

Re-direct examination of Daniel Drawbaugh by Mr. Hill continued:

(Witness continues:) The screw G, to the best of my recollection, was provided with a screw band, and was stationary, for the purpose of moving cylinder B horizontally while it was revolving. I know it was intended to have a horizontal movement, and I think that was the plan.

Q. Q. 1595. What effect did you understand the horizontal movement of the cylinder would have upon the tracings made by the little pointer or tracer?

A. The idea of the horizontal movement was that when the cylinder would make a complete revolution, it would not present the same surface of paper; that is, it would present a new surface of paper.

Q. Q. 1596. Was this "Phonautograph" described as a machine operating by any form of electricity or magnetism?

A. No, sir.

Q. Q. 1597. Was it described as a machine for transmitting sounds to a distant point and enabling them to be heard?

A. No, sir; it was intended to record sounds within the cylinder that were made in the neighborhood of the membrane—the way I recollect it.

Q. Q. 1598. Do you recollect whether you first saw that description of this "Phonautograph" before or after you made your phonograph experiments?

A. I think, before—I am positive, before.

Q. Q. 1599. Do you remember whether your phonograph experiments were before the Axle Company began operations or not?

A. I don't think they were before the operations began.

Q. Q. 1600. Do you remember whether they were before you moved to Mechanicsburg or not?

A. I think so.

Q. Q. 1601. Do you remember whether you saw the description of the "Phonautograph" before the operations of the Axle Company began?

A. Yes, sir; a good while before that—a number of years before that. I couldn't give the number though.

Q. Q. 1602. Had you made and used any of your telephones before you saw the description of the "Phonautograph"?

A. I couldn't be positive as to that. I think I had, but wouldn't like to be positive.

Q. Q. 1603. There was a machine made at Paris, France, as early as 1864, and in Germany before that time, and well known in France and Germany, that is known as the Reiss telephone, from the name of its inventor. Had you ever known of that machine prior to Mr. Matthew's visit to your shop, early in 1878?

A. I think I had. I got a knowledge of that machine from Mr. Shapley, at Mechanicsburg, during the time I lived in Mechanicsburg. He gave me a copy of the *Scientific American* that had an illustration and a description of it in, and told me that was something of the nature of the machine I was working at, then. I think the paper may be in my shop somewheres yet.

Q. Q. 1604. What did you understand to be the character and mode of operation of that Reiss telephone?

A. It was represented as transmitting musical sounds or tones by means of electricity.

Q. Q. 1605. Did you understand it to be an instrument operated by a continuous circuit, or by a make and break circuit?

A. By a make and break.

Q. Q. 1606. Did you examine the description and illustration sufficiently to thoroughly understand the construction and mode of operation of the instrument?

A. Yes, sir; I did.

Q. Q. 1607. Did you, at the time, regard it as an instrument capable of transmitting vocal speech, between distant points, so it could be understood?

A. I did not. It wasn't represented, either, to be that.

Q. Q. 1608. Do you remember whether any other telephone was described in the same article in which you saw a description of that?

A. I don't think there was. The description of that was given in connection with a lecture that was given in New York on the telephone or some portion of science. At any rate, the telephone was a part of the lecture. The gentleman delivering it was proposing some improvements—that it might be used for transmitting spoken works—I don't remember exactly. He didn't have any particular plan, but he thought it might be got at by properly arranging the walls of the instrument and destroying the reflection. If I remember right, I think the instrument had been put up in the Hall, and he exhibited the apparatus.

Q. Q. 1609. When you read the description of that Reiss instrument, as stated, do you remember whether you agreed in opinion with the lecturer, as to the possibility of adapting a make and break instrument to transmitting vocal speech?

A. I didn't think a make and break instrument would be able to transmit spoken words.

Q. Q. 1610. Had you, before you read that description, transmitted vocal words from one place to another, by means of any of your electric or magneto talking machines?

A. Yes, sir. I had. I am positive of that.

Q. Q. 1611. The little magneto machines, "D" and "E," if I understand you and other witnesses, were made about the time when the Axle Company commenced operations. They were not, if I understand you correctly, the first magneto telephones that you had made?

A. They were not the first. "C" was the first magneto-transmitter, and "I" was a receiver. Some time after that, I used "I" as a magneto-transmitter also.

Q. Q. 1612. When you made and used the carbon machine "F," with its receiver "B," that is, the old tumbler and tin can, and transmitted vocal speech through them, so that it could be heard and understood at a distance, did you regard the invention as a mechanical success, so far as the transmission of vocal speech was concerned?

A. I did so far. It wasn't as satisfactory and loud as I wished it to be. I afterwards tried to make it more satisfactory. I did make it a success so far as transmitting speech—for I did do that—but I thought it wasn't loud enough for practical purposes. That idea I may have got from others, for a good many persons remarked that it wasn't sufficiently loud.

Q. Q. 1613. You spoke, in your direct examination, of other persons suggesting that the instrument ought to be made loud enough for a person to stand at a distance from the receiver, and hear and understand what came through it, without going to the table, or place, where the receiver was situated. Is that what you refer to in your last answer as the idea of some others?

A. Yes, sir; and some said it wasn't loud enough, without making the remark about going close to the table, or to where the instrument was.

Q. Q. 1614. Were the instruments "C" and "I" an improvement in respect to loudness?

A. Yes, sir. Loudness and plainness too.

Q. Q. 1615. Were they an improvement, or not, in respect to adjustment?

A. Yes, sir.

Q. Q 1616. I understand you that, as early as 1870 or 1871, you would have taken a patent on your telephone, if you had had the means. Am I correct?

A. Yes, sir.

Q. Q. 1617. You regarded the invention then as a mechanical success, and as practicable, for the transmission of vocal speech to distant points. Did you not?

A. Yes, sir; and before that, perhaps.

Q. Q. 1618. State whether you ever afterwards changed your mind about it?

A. No, sir. I never did, but I was still working on it, and trying to improve it more.

Q. Q. 1619. And you are still endeavoring to improve it, if I understand you?

A. Yes, sir.

Q. Q. 1620. Do you know whether, or not, a great many other inventors are still endeavoring to improve the telephone?

A. Yes, sir. I think so, by what I can hear and read on the subject.

Q. Q. 1621. Have you ever talked, or heard anybody talk through the telephones that are in use here in this city of Harrisburg, connected with the Telephone Exchange?

A. Yes, sir.

Q. Q. 1622. When, first?

A. I don't know. I could hardly give the year. It was about 1878 or 1879. It may be before.

Q. Q. 1623. Where?

A. At Mr. Stees' lumber office, at the lower end of the city, and, I think, at the Western Union Telegraph Office, at the time they had a small office outside—a temporary building in the yard—Mr. Clute gave me the instrument, and some person at a distance spoke. I could not understand, and he took the instrument. The instrument then used was the oval instrument. I think it was the Phelps instrument.

Q. Q. 1624. How did that instrument compare in loudness and clearness with your old tumbler and tin can instruments, and with your magneto instruments, "C" "I?"

A. I didn't think it was as loud as my magneto instruments, "C" and "I," and it wasn't as loud as the old tumbler and tin can instruments, when properly adjusted—and other instruments also. The clearness—I think the tumbler instrument wasn't as clear perhaps. I think that all magneto instruments are more clear, but not as loud as the carbon instruments. I mean all the magneto-instruments that I have examined or tried. I think the Phelps instrument was clear, and didn't notice anything in its clearness. It was a magneto-instrument. It wasn't used as a carbon instrument.

Q. Q. 1625. I understand you that you could not hear through the Phelps instrument. Why was that? For want of loudness or clearness? I refer to the time when you tried it at the Western Union office.

A. For want of loudness. I heard some words but not whole sentences. I didn't understand the subject the man was speaking upon.

Q. Q. 1626. Could you hear and understand, through the instrument at Mr. Stees' office, when you tried it?

A. I did, some, yes.

Q. Q. 1627. How did that instrument compare in loudness with your old tumbler and tin can instruments, and with your instruments "C" and "I?"

A. I don't remember that I formed any idea at the time.

Q. Q. 1628. How did it compare in clearness, with your old instrument, referred to in my last question?

A. That I don't remember. As I remember now, I think it was clear. I understood the instrument.

Q. Q. 1629. Did you, yourself, ever procure the publication of any articles about your electric or magnetic clocks?

A. Never; no sir.

Q. Q. 1630. You moved back from Mechanicsburg about the first of April, 1877, and the electric Clock Company commenced business in the spring of 1878. During that year, from the time when you moved back from Mechanicsburg till the time when the electric Clock Company commenced business, to what extent were you working on your telephones?

A. As near as I remember, I was working on them. The extent I can't exactly say, but I was working on them, I know. I think that, during that time, I was experimenting on different kinds of diaphragms. That is, on the cone. I had a temporary cone put up against the wall of the shop, or against the cupboard of the shop. I am pretty positive that was one of the experiments, that I had during that time. There may be others that I don't remember. Very likely there were. I might state here, that, while I was experimenting on that, I made quite a number of cones of different shapes, and tried them; but some of these experiments may have been after 1878, too. But I got up a complete cone instrument between 1878 and 1880, or between 1879 and 1880. It is sufficient to say, it was the cone instrument.

Q. Q. 1631. Did your experiments on telephones run through the year 1877, or were they confined to any particular part of that year?

A. I don't remember. Whenever I had time, I would work on them. I know I worked very often at night on them, and late at night, particularly if I had any work to do in the daytime.

Q. Q. 1632. During the year 1877, where were the telephone instruments that you had made prior to that time?

A. They were in the shop.

Q. Q. 1633. Were they capable of being practically operated, during that year?

Yes, sir.

Q. Q. 1634. And were they practically operated during that year?

A. Yes, sir; on lines in my shop; and a great many persons heard them operated, at different times.

Q. Q. 1635. You have spoken, in cross-examination, of quite a number of different machines, for other purposes than the transmission of sound, which you have, at different times, invented. Referring to those machines, were your old faucets and pumps, which you invented as early as 1866, mechanically successful?

A. Yes, sir; they were.

Q. Q. 1636. Is your water motor a mechanical success?

A. Yes, sir; I think so. There was quite a number of them put up, and they are running machinery.

Q. Q. 1637. Was your magnetic clock a mechanical success?

A. I think so. It has been running a number of years.

Q. Q. 1638. Was your grape stemming machine, that you invented and made for Mr. Hertzler, a mechanical success?

A. Yes, sir.

Q. Q. 1639. Was your tack machine a mechanical success?

A. Yes, sir.

Q. Q. 1640. Was your stave-jointer a mechanical success?

A. Yes, sir; there were over a hundred sold in Cumberland county.

Q. Q. 1641. Was your stave-cutter a mechanical success?

A. Yes, sir.

Q. Q. 1642. Was your nail-plate feeder a mechanical success?

A. Yes, sir; I think it was. I don't see why it wasn't.

Q. Q. 1643. Was your ryne and red-staff a mechanical success?

A. Yes, sir.

Q. Q. 1644. You testified to getting up machines to do the Faucet Company's work. Were they mechanically successful?

A. Yes, sir; they had been used in the shop a number of years, and were used in Hauck brothers' shop, at Mechanicsburg, several years.

Q. Q. 1645. You testified to getting up machines to do the Axle Company's work. Were they mechanically successful?

A. Yes, sir.

Q. Q. 1646. Was your stethoscope a mechanical success?

A. Yes, sir; I think it was. I could use it as such, and did use it.

Q. Q. 1647. Did it work well?

A. Yes, sir. I might explain it. I had a tube connection with it, perhaps four or five feet long, for trial. I put a watch at one end of it, and could hear very distinctly the ticking of the watch. I put one end of the instrument to my heart and the other end to my ear, and could hear the beating of my heart.

Q. Q. 1648. Was your machine for wrapping wire a mechanical success?

A. Yes, sir; I used it for that purpose, and it answered the purpose very well.

Q. Q. 1649. How did your fire apparatus work?

A. That worked very well. I had it temporarily put up, and a number of persons seen it and tried it. I considered it an apparatus that would work.

Q. Q. 1650. How did your dial telegraph work?

A. It worked very well. I never had it on a very long line, but suppose it would work on a pretty long line.

*Q. Q.*6 151. You testified to having at one time a cider mill, which you sold in the summer or fall of 1875. Do you remember what you got for it?

A. I don't remember the exact amount. I think it was somewheres between thirty-five and forty dollars.

Q. Q. 1652. To whom did you sell it?

A. Elias Hake.

Q. Q. 1653. How did he pay for it, and when?

A. I took a portion of it out in flour and mill feed. He paid me some money, but I don't remember the amount. He paid me some money when he bought it, and the mill feed—I suppose I had got some before that and some after. I don't remember distinctly.

Recess for dinner until 2, P. M.

Feb. 18, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present, same counsel.

Re-direct examination of Daniel Drawbaugh by Mr. Hill continued:

Q. Q. 1654. Do you know the full name of Mr. Clute?

A. I do not. I meet him very frequently, but I never knew his full name. I may have heard it, but have forgotten.

Q. Q. 1655. What is his occupation now?

A. He is connected with the telephone business in some way. I do not know what—an agent, as I understand it.

Q. Q. 1656. Do you understand him to be an agent of the Bell Telephone Company, one of the Complainants?

A. Yes, sir. That was what I had reference to. I heard it stated that he was. I understood it to be such. He told me had a number of counties that he was attending to. I got the impression that he was an agent.

Q. Q. 1657. What was his occupation at the time when you tried the telephone instrument, that you think was the Phelps, at his office?

A. I thought he was proprietor of the Western Union Telegraph Office, then, and of the telephone in connection with that. I just formed the impression. I don't think he told me that.

Q. Q. 1658. You spoke something about a building in the yard. What was that and what was it used for?

A. It was used for the telephone. I seen nothing in there but a couple of Phelps' telephones; and a call I seen there too; that is, a Morse sounder, which, I supposed, was used for a call.

Q. Q. 1659. When Mr. Shapley showed you the copy of the *Scientific American*, with the illustration and description of the Reiss telephone, do you remember how long it was after the article was published or after the date of the newspaper?

A. I don't remember how long, but my impression was that it was was not very long, though it might have been six months. I ain't positive as to the length of time.

Q. Q. 1660. Have you and Mr. Shapley been on friendly terms since the Clock Company was started?

A. When we meet we speak, but I don't think he thinks as much of me as he did at one time. By his manner when we meet I would think he didn't think very much of me.

Q. Q. 1661. When you purchased your old parlor organ, for the use of what member of your family did you purchase it?

A. For my daughter Emma.

Q. Q. 1662. When you saw the Edison, Phelps, Bell, or other telephones here in Harrisburg, did you open them to see what the internal construction was?

A. No, sir. I did not.

Q. 1663. Did you ever see Alexander Graham Bell's telephone patents, or copies of them, prior to the institution of this suit?

A. No, sir.

Q. Q. 1664. In cross-examination you spoke of making certain tests of the telephone currents by means of a galvanometer. How often and in what years did you make such tests?

A. I couldn't tell how often—at different times—frequently, at a pretty early time.

Q. Q. 1665. You testified to adjusting the carbon instrument to a certain amount of resistance, and then testing the current by a galvanometer, and that the galvanometer appeared to show a less amount of current passing over the line, while you were speaking through the telephone, than when you were not speaking. Did you, at the time, form any theory or opinion as to the cause of this phenomenon?

A. I think I did. Yes, sir.

Q. Q. 1666. What was your theory regarding it?

A. The amplitude of vibration would be less when it was in contact with the carbons. That is, the movements from the carbon would be greater than the amplitude towards the carbon, or low conductor, which would diminish the general pressure of the carbons, which would denote less current—more resistance.

Q. Q. 1667. You have several times in cross-examination mentioned using tin in connection with your instruments. Did you mean tinned sheet iron—commercial tin ?

A. Yes, sir. Tinned sheet iron. Tinned plate, it is called.

Q. Q. 1668. You have testified that you had a sheet metal diaphragm on the instrument "C" at an early period. Was that the first sheet metal diaphragm that you used on any instrument ?

A. No, sir. I think not. On the tumbler instrument I had used one.

Q. Q. 1669. You have testified, in answer to cross-question 1271, that a bladder membrane would last a long time, if the mice didn't eat it. Were the tumbler and tin box instruments, which contained bladder membranes, kept where they were accessible to mice ?

A. Yes, sir. There was mice in all portions of the shop.

Q. Q. 1670. Did it ever happen that they got on the diaphragms and ate them, to your knowledge ?

A. Yes, sir. Several times they had destroyed or ate part of one of those reproduced instruments—middling recently.

Q. Q. 1671. Were you accustomed to keep yourself provided with bladders for such an emergency ?

A. I had, sometimes, bladders about the shop.

Q. Q. 1672. You have several times referred to the time of painting Sadler's wagon as the time at which, or before which, you could fix the date of instrument "C," and the time of painting Sadler's wagon has been pretty definitely fixed by the testimony of George W. Drawbaugh. By your own unaided memory, without the assistance of George W. Drawbaugh, how near could you have fixed the time of painting that wagon ?

A. I don't know—within a year or two, I guess.

Q. Q. 1673. By your own unaided memory could you, or could you not, have fixed it as being prior to the time when Haucks purchased the faucet business?

A. Yes, sir; I could have. I know it was before that.

Q. Q. 1674. You have testified that the electro-magnet now on instrument "B" is somewhat smaller than some of the electro-magnets which were formerly upon that instrument. Do you know when the electro-magnet, that is now on "B," was put there?

A. I do not. I don't know when.

Q. Q. 1675. State whether it was put there for any purpose connected with this suit?

A. I don't know that it was. I can't remember that it was.

Q. Q. 1676. Do you know whether there has been any change in the electro-magnet of that instrument, by taking one off and putting another on, since the time when instrument "A" was made, prior to the beginning of the Axle Company?

A. I don't remember. I think not. There has no change been made, to the best of my recollection.

Q. Q. 1677. In cross-answer 906, referring to your offering Shapley one-half interest in the clock, you say, "I suppose I offered him one-half, as I was in the habit of doing—a half interest in nearly all my other inventions." Do you mean that you offered Shapley a half interest in nearly all your other inventions, or that you were in the habit of offering other parties that you thought would invest?

A. I was in the habit of offering other parties a half interest in my other inventions. I had reference to that one invention—the clock.

Adjourned until Feb. 20, 1882, at 9.30, A. M.

Feb. 20, 1882, 9.30, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Re-direct examination of Daniel Drawbaugh by Mr. Hill continued.

Q. Q. 1678. You have referred in your re-direct examination to seeing a description of a Reiss telephone, in the *Scientific American*, in a copy of said paper, given you by Mr. Shapley. After giving that testimony you were requested, orally, by Mr. Storrow, to make a search for the paper. Have you complied with his request?

A. Yes, sir.

Q. Q. 1679. Did you find the paper?

A. Yes, sir; I made search for it yesterday. I suppose I was at it four or five hours—making search for it.

Q. Q. 1680. Have you the copy of the paper here?

A. Yes, sir.

Q. Q. 1681. Will you please produce it, that I may put the article referred to in evidence?

A. Yes, sir; Here it is.

[*Mr. Hill puts the said article in evidence, to be marked "Exhibit Reis Telephone Publication," the same being an article entitled "The Invention of the Telephone," by P. H. Van Der Weyde, M. D., contained on page* 145, *of the Scientific American, of March 4th,* 1876, *the number of the newspaper being, Vol.* 34, *number* 10, *new series.*]

[*The name of the inventor referred to in said article is spelled "Reuss," but it is agreed between counsel for Complainants and Respondents that he is the same individual whose name is usually spelled "Reis."*]

Q. Q. 1682. While making your search for this article about the Reis Telephone, did you anywhere discover the articles describing and illustrating the phonautograph, as testified by you?

A. No, sir; I don't remember what publication I seen it in. I wasn't sure that I seen it in the *Scientific American;* but I didn't find it.

Q. Q. 1683. While making your search, did you discover any article relating to the recording or transmitting of sound?

A. Yes, sir.

Q. Q. 1684. If you have the article, or articles, here, please produce them that I may put them in evidence?

A. Yes, sir; the article is here and is entitled "Improved Acoustic Telegraph."

[*Mr. Hill offers said article in evidence, to be marked "Exhibit Everitt Acoustic Telegraph," the same being an article entitled "Improved Acoustic Telegraph," contained on page* 369, *of the Scientific American, of December* 12*th,* 1863, *volume* 9, *number* 24, *new series. Mr. Hill also offers in evidence, as "Exhibit Scott Article," an article entitled "Fixing Sounds," contained on page* 371 *of the same number of the Scientific American, to wit, the number of Dec.* 12*th,* 1863.]

Q. Q. 1685. Were you a subscriber of the *Scientific American* at the time of the issue of the number of December 12th, 1863?

A. Yes, sir. I was.

Q. Q. 1686. Is this number, which you have produced in evidence, one of the papers which you received as a subscriber at that time?

A. Yes, sir. I got it out of the volume. I generally filed the numbers regularly as I got them. I mean after reading them.

Q. Q. 1687. In the article entitled "Improved Acoustic Telegraph," at the upper right-hand corner of the cut thereon, I observe a cross, in pencil marks; and at the upper end of the article entitled "Fixing Sounds," I observe two pencil marks. Explain when and why those pencil marks were placed there?

A. The time is so long that I don't remember when the marks were placed there. But they may have been placed there shortly after I received the papers. I marked them for some purpose,—perhaps referring to some article of the same nature. I could not positively say for certain what they were placed there for.

Q. Q. 1688. In cross-examination, you referred to the fact that you at one time connected your telephones to a wire fence, and placing the transmitter near the clock, with the receiver at the other end of the line, transmitted sound over the line for a distance of over a mile and a half. Was that experiment a successful one, or not?

A. Yes, sir. I could hear the tick of the clock at the receiving end.

Q. Q. 1689. Do you remember what transmitter and receiver you used in that experiment?

A. I used the transmitter—the glass tumbler—set it up on a bracket close to the face of one of those old English clocks, that was then in the office, in the small private room; and the other end—I think it was the tin can—I won't be too positive—was at the receiving end; and I heard the ticking of the clock. I will explain a little about the bracket I mentioned. I don't know whether it was properly a bracket—I had removed the casing that covers the face of the clock—that slid on that. After removing, that formed a shelf at the side of the face of the clock, and on that projection was where I had set the transmitter.

Q. Q. 1690. Did you measure the length of the line, or only estimate its length according to your best judgment?

A. I didn't measure it. I just estimated it. I take it from this; that it is a pretty long fence row, and it had a number of wires—three or four—that I had insulated, and caused the current to travel back and forth over them.

Q. Q. 1691. Why did you not use that line for transmitting vocal speech?

A. I hardly know why. I did that in the evening. I know there was no one present but myself. The experiment was, to know whether I could hear a delicate sound made through a considerable length of time.

Q. Q. 1692. Had you, before that time, successfully transmitted speech over wires by means of your electric telephone?

A. Yes, sir.

Q. Q. 1693. Had you, before that time, experimented in listening to the ticking of a clock, and the transmission of its sound by your electric telephone?

A. Yes, sir; over the shorter lines in the shop.

Q. Q. 1694. How did you find the results over the long line, compared with the results that you had before obtained over the short lines?

A. I don't remember the difference that there was. I heard the ticking of the clock in both cases. I know I distinctly heard the tick of the clock in the long line.

Q. Q. 1695. Did the experiment satisfy you that telephones would work successfully on lines of a mile or more in length, or not?

A. Yes, sir. I believed that before, though. I believed they would.

Q. Q. 1696. You testified, on cross-examination, that when, during the cross-examination, you went to Mr. Christian Eberly's house, to refer to his account books, Mr. Jacobs went with you. State whether or not it was understood by counsel for Complaintants here at the time, when you were requested to go, that Mr. Jacobs should take his carriage and convey you there, for the reason that you had no conveyance of your own?

A. Yes, sir; Mr. Jacobs, after they made the request, stated himself, that he would take me. The roads were bad, and I think that we adjourned at an earlier hour that evening for that purpose, that we generally did.

Q. Q. 1697. Complaintant's counsel also requested you to visit Mr. Gardner, and abtain certain information from him on his books, which it appears you did not do. Why did you not?

A. I had asked Mr. Jacobs, and told him we would go down to Mr. Gardner's—I had no other way—he generally took me to these places—and he refused or declined to go, on account of the Eberly matter being placed on the record.

Q. Q. 1698. In cross-question 1201, referring to your visit to Mr. Eberly's to examine his books, Mr. Smith asked you, "Was Mr. Jacobs with you, when you obtained this information from Mr. Eberly?" Was that the matter, which, being placed on the record after the understanding of counsel that Mr. Jacobs should go with you to Mr. Eberly's, caused Mr. Jacobs afterwards to decline going with you to Mr. Gardner's?

A. Yes, sir; he told me so—that for that reason he declined taking me.

Q. Q. 1699. You have testified in cross-examination, that you made a number of changes of magnets in some of your telephones, state whether or not you ever changed the electro-magnets on instrument "A," after its construction.

A. No, sir. To the best of my recollection, I did not.

Q. Q. 1700. State whether or not you ever changed the magnets or electro-magnets on the small magneto instruments "D" and "E," after their construction?

A. No, sir. I did not. I know I did not on them. I am positive I did not. I had made some little changes in diaphragms—sometimes thicker, and sometimes thinner diaphragms; and I had made the interior larger—turned out a recess in one of the instruments. That is all the change I can remember of.

Q. Q. 1701. State whether or not you ever made any change in instrument "A" after the formation of the Axle Company?

A. I think not. To the best of my recollection, I did not.

Q. Q. 1702. Is it your recollection that you had the instruments "C" and "I" in operation up to the time when the instruments "A," "D" and "E" were made?

A. I think so. To the best of my memory or recollection, I had.

Q. Q. 1703. A great many different witnesses have testified to the fact of their being at your shop prior to the year 1876, and seeing and using your different telephone instruments, or some of them; were those witnesses all the persons who visited your shop and saw and used your telephones prior to 1876, or not?

A. No, sir. They were not. I couldn't remember all the parties. I don't suppose we have near all the parties that visited me. But have learned of other parties, that I know were there and seen the instruments, and that I explained them to them.

Q. Q. 1704. Referring to the paper tub or funnel, that you have testified was applied at an early day to your receivers, and was placed on or taken off at different times; state whether or not that funnel was so turned up as to make it more convenient to apply them to it than to the end of the tin can receiver?

A. Yes, sir. That was the idea; and that it would be brought down smaller and concentrate the sound more to the ear.

Q. Q. 1705. You were asked a number of questions in cross-examination with reference to changes in instrument "B," before you quit using instrument "B." When did you quit using instrument "B?"

A. I could hardly state when I quit using "B." I had used the tumbler in connection—I had used it in connection with other instruments, after I had used the tin can, but how long I can't say. I could not exactly state when I quit using the tin can. I often, though, showed it to parties at a later period. It may have been up to within a year or so ago, that I showed it, as that was one of the original instruments that I used as a receiver. I mean that I showed it to parties to illustrate that it was one of my original telephones or receivers.

Q. Q. 1706. Did you use the old tumbler instrument to illustrate in the same way?

A. Yes, sir.

Q. Q. 1707. You were asked in cross-examination whether the metal diaphragm which is now on instrument "C" is the one that was on it at the time of your painting Sadler's wagon, to which you answered that you thought so, but would not be positive. Do you remember whether the diaphragm of "C" has been changed since you dispensed with the the two diaphragms and the connecting strings on that instrument?

A. I don't think it was, but I won't be too positive. I don't remember.

Q. Q. 1708. Do you remember whether the diaphragm was corrugated at the time when you were painting Sadler's wagon?

A. I think it was.

Q. Q. 1709. Please think over the experiments that you made with the telephone instruments connected with the wire fence, and state whether you distinctly remember now what instrument it was that you used as a receiver in that experiment, whether it was instrument "A" or "B," or some other instrument?

A. I don't just very distinctly remember now, but I have an idea that it was the tin can. The experiment was at a pretty early day, too, and that makes me think it was "B." I can't state the year when the experiment was. I may have tried on others. I may have tried it on "A."

Q. Q. 1710. In cross-question 1439, you were asked whether, after the work that you did for Etter & Shanklin, you did any work for Hake's mill, to which you answered that you did some work, but did not remember how much. Do you remember whether you got your pay for that in money, or in something else?

A. In flour, feed, and mill-stuff—no money.

Q. Q. 1711. (*de bene.*) You were asked in cross-examination, with reference to an alleged statement of Mr. Clarence D. Rockafellow, to the effect that you told him, in April, 1878, that you had not as yet made your telephone a mechanical success and were yet to make improvements on it to make it practical—a result which you had not yet attained, to which you replied, "Well, I may have said that, because I was working to get louder results. I know I made that remark often, and he appeared to be satisfied with the result—the tenor of his conversation. I don't remember the words. The remark above referred to, as one that I often made, was that I kept improving it to get louder results." Please explain more fully your meaning in said answer?

A. I don't remember, you know, the particulars of that conversation, but I often made the remark to others that I was still working on it, as improving it. There was parties often said that they was satisfied they could hear the words, but it should have been made louder. They could hear it at some distance—and from that fact of my trying to get it to produce as loud results as possible. And I may have stated to him that I was trying to get it more successful. I don't see why I would say it wasn't a mechanical success, because I had it in use, and even he heard through it and appeared to be perfectly satisfied.

Q. Q. 1712. (*de bene.*) It is alleged that Mr. Rockafellow says, in effect, that you were, at the time of his visit, constructing a new telephone. Do you remember what particular instrument it was that you were then at work upon?

A. I do not remember what instrument.

Q. Q. 1713. (*de bene.*) Did you at that time, or did you not, regard your telephone invention as having reached the condition of a practicable machine for the transmission of vocal speech, between distant points, by electricity?

A. Yes, sir; but there was no period but what I was still improveing on them.

Q. Q. 1714. (*de bene.*) It is alleged that Mr. Rockafellow says that you told him you had not yet attained the result of a practicable instrument. What have you to say about that statement?

A. I don't know what to say about it. He might have inferred from my manner of speaking, as I stated generally, that I was improving on it. He might have inferred by that that it was not a practical and mechanical success. I did not know whether he had that idea, but I say he may have inferred it. I think that it was a success, because I transmitted spoken words through it, and a great many other people had heard through it and spoke trough it.

Q. Q. 1715. (*de bene.*) Do you remember the words or expressions that you actually used in that conversation with Mr. Rockafellow?

A. No, sir; I don't remember the words that I used.

Q. Q. 1716. (*de bene.*) How long was the conversation?

A. As near as I can remember, between half an hour and an hour It may have been a little more. I don't remember the length of time.

Q. Q. 1716. (*de bene*) What did Mr. Rockafellow go to your shop, on that occasion, for?

A. I don't remember. I don't know. He came in and I showed him the instruments. I showed him the clock also, and a number of other instruments.

Q. Q. 1717. (*de bene*) Do you remember whether he came to see the clocks?

A. I don't remember. I don't know what he came for.

Q. Q. 1718. (*de bene*) Was anyone with him?

A. I think there was a gentleman, but I don't remember that very distinctly.

Q Q. 1719. (*de bene*) Do you remember whether the other gentleman talked through the telephones or listened to them, or not?

A. I don't remember that. He may have.

Q. Q. 1720. (*de bene*) Do you remember whether the other gentleman took much part in the conversation about mechanical matters?

A. I don't think he did. Rockafellow and I had most, or I may say, all of the entire conversation.

Q. Q. 1721. (*de benc*) Do you remember what particular telephone instruments were used, when Rockafellow tried them?

A. I do not.

Q. Q. 1722. (*de bene*) Where were the transmitter and receiver when Rockafellow tried them?

AMERICAN BELL TELEPHO

A. I don't remember that exactly, but it occurs to me that he was in the small room when he listened. But I won't be too positive.

Q. Q. 1723. (*de bene*) Who talked through them when he listened?

A. I did. I think so.

Q. Q. 1724. (*de bene*) Were you in the same room with him when you talked through them and he listened, or in different rooms?

A. That occurred so often—of people coming there and I would exhibit—but as a general thing I would not be in the same room. I would always be in a different part of the shop. I don't remember whether I was down stairs or not, but it was likely I was down stairs, providing I had the instrument really up. Sometimes I wouldn't have them attached, and had to carry them and attach them to the wires. I don't remember exactly how it was. It occurred so often of people coming there, that I couldn't remember particularly the occurrence of each one.

Q. Q. 1725. (*de bene*) When Rockafellow had listened at the receiver, did he say whether he heard through it what was said at the transmitter?

A. I think so, for I know that was the general conversation after we met. He appeared to be satisfied with the results.

Recess for dinner until 2, P. M.

Feb. 20, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Re-direct examination of Daniel Dawbaugh by M. Hill continued:

Q. Q. 1726. (*de bene*) Do you recollect whether he expressed himself as satisfied with the results?

A. I don't recollect that, but my impression was that he was satisfied. I think he said it worked well, or something of that kind. I don't remember the conversation, but I inferred that he was perfectly satisfied.

Q. Q. 1727. In cross-question 1294 you were asked, in substance, in what condition did you get the best results from the carbons, as to being moist or dry. To which you answered as follows: "After my later experiments, I found the dry carbons were the best. In the former—in using earth and some of them combinations—a certain degree of moisture was the best." What time do you refer to as the time of your later experiments mentioned in that answer?

A. At the time I used carbon alone—charcoal and coke and gas retort carbons—I had no particular times. I mean by the later experiments, when I used these carbons. I had reference to fine carbons—pulverized.

Q. Q. 1728. At how early a time do you think you used carbons dry?

A. I couldn't positively give you any period; as early as 1871, perhaps, and perhaps a little later. I can't just give you the time.

Q. Q. 1729. You were asked in cross-examination—cross-question 1538—whether you and Mr. Jacobs, or either of you, had visited Mr. Watts for the purpose of obtaining an affidavit from him, to which you replied that you had and said he declined giving an affidavit. You were then asked in the next question whether Mr. Watts, at the time of his visit to your shop, said anything to you about having seen an article in the *Scientific American* in regard to transmitting sounds. State all that you remember that Mr. Watts said at the time when you and Mr. Jacobs visited him for the purpose of getting his affidavit which he declined to give.

A. We had asked him for an affidavit, and he declined giving it. He said that if he was regularly summoned, he would attend. There was some other conversation, but I don't remember what it was.

Q. Q. 1730. Do you remember whether he stated that he had seen telephone instruments at your shop at the time of his visit there?

A. I think he did. We had give him two visits. At the first visit, I think he stated that he had seen instruments at my shop.

Q. Q. 1731. At the time of your second visit to Mr. Watts, do you remember whether he said anything about having been called upon by one, Mr. Weeks, for an affidavit in behalf of the Complainants?

A. Yes, sir; I didn't remember any more the name of the party, but he said he had been called on for an affidavit for the opposite side, and I think he said he had declined giving him one.

Q. Q. 1732. You referred, in answer 1544, to making the observation to a number of persons that a sound would be reproduced on a window pane.

A. I meant that on one occasion I was sitting close to the window, and my daughter was playing on the organ, and I discovered the sound of reproduced music close to where I was, at the window, and I examined it, and found that a portion of a window pane was loose at the corner.

Q. Q. 1733. How long ago was that?

A. I don't remember. It appears that was pretty long ago. I couldn't state how long; quite a number of years, though.

Q. Q. 1734. Referring to the machine "H"—the large machine with the inclined front side and the call-bell on top—do you remember whether, since that machine was first constructed, you have ever changed any of the parts of it, substituting other electro magnets, or otherwise changed it?

A. No, sir; I think not. To the best of my recollection, I did not. There were no electro-magnets in that machine, as far as the transmitting was concerned. There was an induction coil. There had been an electro-magnet in for the call-bell. That was removed.

Q. Q. 1735. Then the transmitting instrument therein contained remains the same as when it was first constructed, if I understand you correctly?

A. Yes, sir; to the best of my recollection, with the exception that the carbons may be lost out, and I guess they are now.

Q. Q. 1736. And the instrument "J"—with the double set of carbons—has that been changed in any respect since it was first constructed?

A. No, sir; not to the best of my recollection.

Q. Q. 1737. Referring to the instruments "A," "B," "D," "E," "H," and "J," state whether or not you ever had to make search for any missing parts of any of those instruments, so far as you recollect?

A. Not that I can recollect. Now since considering, I think I made search for the cover of one of the magneto instruments—the one that has the bottom cover off.

Q. Q. 1738. Do you mean that you made search for the missing bottom cover?

A. Yes, sir.

Q. Q. 1739. You have testified, in effect, that after unsuccessful efforts to induce different people to take a half interest in your telephone invention, and furnish the money for procuring patents and introducing it into public use, you expected other parties to go into the manufacture of the magnetic clocks and to go into the manufacture of the improved faucets. What was your object in embarking upon the clock business and the faucet business in 1878 and 1879?

A. My object was this, that I was pretty poor. I was anxious to get some party to take an interest in and run that business, to make some money by it. I was anxious also to make a raise, to have money to secure my telephone improvements. I know that I often desired to have made arrangements—get a job—that I could make some money for that purpose.

Q. Q. 1740. You were asked a good many questions in cross-examination as to different machines that you had invented, other than telephones, but you were not asked whether you ever invented an Electric Induction Balance, or any improvement therein. I now ask you that question?

A. No, sir. I never invented an Induction Balance. I worked on an apparatus that I used. It could not be called exactly an Induction Balance. It was for trying experiments on coils. That is, on electro-magnets—a balance that you might apply on an armature, and suspend a magnet and a pan for holding weights. It was for the purpose of trying what amount of iron would be best for a certain sized coil. I think that instrument I described in the direct examination, or it may have been in the cross-examination. I don't remember which.

Q. Q. 1741. Did you ever experiment with an Electric Induction Balance to determine the position of a leaden bullet in a wounded man?

A. No, sir. I never did.

Q. Q. 1742. Then when Professor Alexander Graham Bell made his famous experiments on the President with his Electric Induction Balance, and succeeded in locating the bullet where the Doctors thought it was, but at a long distance from where it afterwards proved to be; I suppose you were not called upon to take part in those experiments, were you?

A. No, sir.

Re-cross by Mr. Smith.

Re-cross Q. 1743. At the visits which you and Mr. Jacobs made to Mr. Watts, or either of them, did you have with you the instruments or any of them which have been produced in evidence by the Defendant's counsel, and show them to him?

A. We may have had them along. We generally took them along—some of them. But I don't remember whether we showed them to him. I am positive we did not at the last visit.

Re-cross-Q. 1744. In the re-direct interrogatory 1632 you were asked, "During the year 1877 where were the telephone instruments that you had made prior to that time," and you answered, "They were in the shop," and in the next question you were asked, "Were they capable of being practically operated during that year," and you answered, "Yes, sir." Were these instruments severally in the same condition then that they are now, as they have been produced in evidence?

A. I wouldn't be positive that they were all capable—that is, the tin can, perhaps, may have been broken. As near as I can remember, they were. I don't remember that they were in the same condition then that they are now. As I said before, the tin can may have been eaten by the mice. I don't remember distinctly. I know there were instruments in working condition, and particularly the one next before the one I would be improving on. I can't make it any better than that. By speaking of the tin can as broken, I mean eaten by the mice,—I mean the membrane of the tin can.

Re-cross-Q. 1745. With the exception of the tin can instrument, do you think all the instruments you had in 1877 were in the same condition that they are now?

A. They may not be in the same condition that they are now, because the carbons of some of them are missing; and by use, in taking evidence here, they have been roughly handled.

Re-cross-Q. 1746. Was the fence, about which you were asked this morning, in the same condition when you made the experiment over it, that it is now?

A. The fence has been removed and another fence put there—not a wire fence, but a wooden fence.

Re-cross-Q. 1747. When you were using instrument "F," how did you hold it. Did you hold it vertically, so that the plates and diaphragm were horizontal, or did you hold it up to your mouth, so that the plates and diaphragm would be vertical, or more or less inclined?

A. In using that, you generally placed it on a table and you would place your mouth to it that way (*indicating*). Occasionally I did raise it up, but in raising it up I raised it carefully and kept it vertical. I found that when I held it in an inclined position for some time, the carbon had a tendency to settle to one side and destroy the adjustment-ment. When I said carbon, I meant carbon or low conductor.

Re-cross-Q. 1748. How did you fasten or support the wooden box, which you described for holding the low conductor, when you used the plate, which has been produced with the instrument, supported by a single rod, instead of a stirrup?

A. I would make a little sketch of it, if necessary. The rod supporting it passed down along the edge inside of the tumbler, and was bent over and fastened to the bottom of the wooden box, and secured to the bottom by a small rivet, which rivet communicated or fastened to the inner plate, or lower plate, of the wooden box that was to contain the low conductor. Where I said bent over, bent at right-angles would be more proper.

(*Witness makes sketch which is put in evidence, marked "Exhibit F Box Sketch," and continues:*)

A represents a brass rod, B a wooden box, C the inner metal plate at the bottom of the wooden box, secured to the bottom by a small pin or rivet.

Re-cross-Q. 1749. In your answer to the 488th interrogatory, on page 876 [843], you speak of using a portion of the money you had from Hertzler and others in payment of old debts, to the amount of a thousand dollars or more. To whom did you make those payments?

A. I don't remember to whom. I generally had a great many debts of different kinds—store-bills and bills for flour, coal and wood, fuel—I could not just enumerate, and I could not enumerate the parties I paid it to.

Re-crosss-Q. 1750. Can't you name any of the parties to whom you made those payments?

A. I might name some, but I made payments more than once. If I have to go by the time when I got the money—I can't recollect who had the warehouse where I got my coal—Graybill & Zacharias. I know I paid them for coal. There was a party went by the name of Natcher, who run the mill. I know I paid him about that time. As near as I can recollect there were store bills of parties that had stores. I paid them some money.

Re-cross-Q. 1751. You mean stores at Eberly's Mills?

A. Yes, sir. I cannot enumerate the different bills I made.

Re-cross-Q. 1752. Do you still own the house at Mechanicsburg that you purchased in 1876?

A. Yes, sir.

Re-cross-Q. 1753. Was a wooden box ever connected to the lower plate of "Exhibit F," as it is produced in evidence in the manner in which you represented in the sketch you have just made?

A. Yes, sir. I think so, to the best of my recollection.

Re-cross-Q. 1754. Will you look at the plate and show any indication of its being connected to a box in that way?

(*Witness takes up "Exhibit F" in his hand and says:*)

A. There was a box placed around this—around this lower plate—the plate connected to the rod. The loose plate was immediately above that, with the low conductor between them. There were a number—and I don't remember the different plans, but I know there was a box placed around that—something to hold the carbons. What I mean is, that there was modifications of these plans, and that I don't just remember every modification.

Re-cross-Q. 1755. What I want to know is, how a box for holding the low conductor was attached to this particular plate and rod which is now in "Exhibit F?"

A. As I stated before, by being placed around that. I can't just exactly tell—by friction or cement. In the sketch that I made, I know that that plan I had used.

Re-cross-Q. 1756. Will you state how the bill of J. R. Miller, for coal and freight, which has been produced, and referred to in answer 592, page 896 [862], happens to be made on one of your printed bill heads. Was Mr. Wilson Miller at your shop at the time it was made out?

A. I don't remember whether he was or not. I couldn't say. It may be possible that he was at my shop.

Re-cross-Q. 1757. Do you remember whether or not he ever came to the shop to collect the bill?

A. He came to the shop. He was there several times, and I think he did ask me for money different times. But whether that bill was made out at the shop I wouldn't be positive.

Re-re-direct by Mr. Hill.

Q. Q. Q. 1758. You have stated, in effect, in your re-cross examination, that some of your telephone instruments, which you had in the year 1877, may not have been in exactly the same condition then that they are now, because some of the carbons have been lost out and the instruments have been subjected to rough usage during the taking of this testimony. Were the instruments in as good condition in 1877, as they are now?

A. They were in better condition, I would think—better condition than they are now.

Q. Q. Q. 1759. Mr. John K. Taylor, on printed page 662 [633–4] of Defendant's record, testifies that you paid him between two and three hundred dollars, balance of an old debt that you owed him for some years, and that you made the payment in September, 1867. Do you remember whether that was out of the money that you received from the Faucet Company?

A. I don't remember; it may have been; I can't remember the different payments.

Sworn and subscribed to before me, this 20th day of February, A. D. 1882.
FRED. M. OTT,
Examiner.

DANL. DRAWBAUGH.

C. E. UPDEGRAFF *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is thirty-eight; my residence 263 South Third street, Philadelphia; occupation now, dealing in sea-shells. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna., and have known him since about May, 1874.

Q. 1. State the circumstances under which you first became acquainted with him?

A. In May, 1874, I had been to Dillstown. I was then practising medicine. I went to Dillstown to operate on a case of cataract. I had an office at that time in Harrisburg, at the corner of Front and Market streets. As I was very fond of hunting and fishing I took a gun with me, and on my return from Dillsburg I went back by the way of Siddonstown. I think that is in Cumberland county. I stopped at Siddonstown over night to see a patient there—a blind girl. I shot along the road game, etc., as far as Eberly's Mills. That was on the next day. I drove down by the mill, along the creek, inquiring after what the probabilities were of catching some frogs, in case I went over for that purpose. I stopped at the mill to inquire. I went into the mill and found Mr. Drawbaugh there. I inquired about the prospects there of frogs and fishing. I seen some machinery there of different kinds. I was always interested in anything in the way of machinery, and it drew my attention. We got on to the subject then of machinery and inventions—the conversation—and he told me that he was an inventor and was getting up, as he expressed it then, a talking-machine. We had a general discussion on electricity and he showed me some of his things he was getting up there for his talking-machine; I suppose we talked there, probably three-quarters of an hour. I then left and came home,—drove over to the city.

Q. 2. Was any one with you on that visit to Dillsburg, if so, who?

A. Thomas Updegrove, of Harrisburg.

Q. 3. Have you refreshed your memory in any way as to the date of that visit?

A. Only from my book account of my visit over there. And I settled it more particularly to-day from the livery stable book, where I got the horse. It was from Mr. Cummings. I didn't see the book; he told me. I asked him whether he had made an entry of it, and he said he would look, and he afterwards told me that an entry had been made of it; the fifth of May, 1874, he said.

Q. 4. Did you afterwards make another visit to Mr. Drawbaugh's shop. If so, when was your next visit?

A. It was about the 20th of April, 1875—from the 18th to the 20th. I get that from my book, from an account I made of a young man I was treating at the time, which was J. M. Boyle, a printer, here in the city. I remember that particularly, because I advised him to quit work and go into the country, and he went with me over there. That was a day or two after I commenced treatment. It was a case of lead poisoning, and I advised him to get out of the printing office. We went to Zacharias' mill. That, I judge, was about three, four, or may be, five miles above this mill where Drawbaugh was. We camped there the first night. Next day we took our boat, a new thing that I had gotten up, that could be used as a boat or folded up and carried—and we put our boat in the river and went down to Eberly's Mills, and we fished and gunned all the way down the stream—upset once or twice. We pitched our tent on a little island at Eberly's Mills, in the creek, and fished about there until evening. It was pretty cold weather and Mr. Drawbaugh came down and tendered us the mill as a place to sleep in. As the evenings were cold we accepted his invitation. We got on to the subject there of electricity and talking-machines, and we talked pretty near all night on the general subject of talking-machines, electricity, inventions, and one thing and another. He showed me the different apparatus that he had and explained to me the manner of its working, and all he wanted then was some one to go into it with him and put money into it to get it patented and then he could use it instead of telegraphing, without an instrument; that is, instead of using the old mode of telegraphing; he could talk directly through the wire.

I rather doubted his machine. I thought he was, maybe, going too far. I know sometimes men get gone on inventions, and I thought he was, maybe, one of that kind of fellows. He said he could prove it. He fetched us some machinery, and we talked through it, and he explained it to me then, or tried to, and we talked through it. The wire was then run out, as I thought, to the house, but I don't think it was; I think it was only run out to one of the sheds. We then had a general conversation on the internal organization of the ear, and he had an instrument there that more particularly attracted my attention on account of the peculiar shape of the magnet. I had never seen anything like it before. It had a magnet of a peculiar shape. We talked until pretty near on to morning, when I suppose we were both pretty well talked out, and he then went to the house, or went out. I suppose he went to the house. We fished about there the next day and had pretty good luck, and then came home.

As to Zacharias mill, I only know that Zacharias was the man who run the mill or attended to it. I don't know whether it was his mill or not, but think he was only the miller there.

Q. 5. Where was Mr. Boyle during that conversation at night in the mill?

A. He was in the mill with me. After talking an hour or so, he laid down and went to sleep.

Q. 6. Where does Mr. Boyle now reside?

A. At Cincinnati, Ohio.

Q. 7. What peculiarity was there about the shape of the magnet that you referred to which attracted your attention?

A. It resembled the ear—the external part of the ear—in shape.

Q. 8. Was anybody there with you except Mr. Boyle on that occasion?

A. No, sir.

Q. 9. Did you afterwards make a third visit to Mr. Drawbaugh's shop? If so, when and under what circumstances?

A. I went over there with a party about the middle of May of the same year.

Q. 10. Who were the parties?

A. Mr. Smith, Mr. McGaffick, and Mr. Boyle.

Q. 11. Can you give Mr. Smith's name and place of residence?

A. I think it is J. H. Smith, 1027 Buttonwood street, Philadelphia, but at that time he lived here. He kept a hotel here by the depot.

Recess until 7.30, P. M.

Feb. 20, 1882, 7.30, P. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for Complainants, and Mr. Hill and Mr. Jacobs for Respondents.

Examination of C. E. Updegraff by Mr. Hill continued:

Q. 12. Please describe what took place at the time of your visit to Mr. Drawbaugh's shop in May, 1875, in company with Messrs. Smith, Boyle, and McGaffick.

A. We went there on a fishing excursion. We camped on that island near the mill, and fished all that day and that night. In the morning, Mr. Smith and myself went up into the town to lay in a stock of provender. On our way down from the town we stopped into the mill to see Mr. Drawbaugh. We had a conversation with him about his talking-machine. I asked him how his talking-machine was getting along, I believe. I think I drew Mr. Smith's attention to the machine. The general conversation was on the machine and on his getting some person to go in with him to—what he wanted was means, or somebody with means—to procure the patent and put it before the people. I suppose we were in conversation an hour, maybe more, at that time. We left there, I think, during the forenoon. We were only there one night.

Q. 13. Was that your last visit to Mr. Drawbaugh's shop prior to the beginning of this suit?

A. I think it was my last visit there. I may, possibly, have been there within a short time after that, but I don't think I was, for we went fishing up in the other direction after that—up by Dauphin.

Q. 14. What is the lawful fishing season for this region?

A. For trout, is from April until June, I think, is the season. Other kinds of fishing you can fish all the year. There is a season for bass and all game fish, but not for ordinary fish. My fishing was for frogs ordinarily.

In reference to that first visit. I mentioned it was on the fifth of May. It was the fourth according to Cumming's book account.

Q. 15. Are you positive that that first visit was in May 1874, the second visit April 1875, and the third visit a short time after the second?

A. Yes, sir.

Q. 16. Did you see Mr. Drawbaugh's talking machines on each of these three visits?

A. On each of those three visits.

Q. 17. Did you talk or hear anybody talk through the machines on your first visit in May 1874?

A. I won't be positive as to that. My impression is that I did.

Q. 18. Did you on your last visit, a short time after the visit of April 1875?

A. I won't be positive as to that. I can't say.

Q. 19. Are you positive that you talked through it or heard Mr. Drawbaugh talk through it on your visit with Mr. Boyle, in April 1875?

A. Yes, sir.

Q. 20. Do you remember whether you and Mr. Drawbaugh were in the same room when you were talking and listening through the instruments?

A. Yes. We were at several parts of the room. At one time I know that I put my hand to my ear, to be positive that I didn't hear the sound only through the machine.

Q. 21. Did Mr. Drawbaugh, at any time, go into another room, or another part of the shop and talk to you through the machine?

A. He went to another part of the shop. I think that we were at the extreme ends of the shop, he at one end and I at the other, so that I was positive that I couldn't hear him speak, only through the instrument.

Q. 22. Do you remember whether he went down stairs and spoke through the instrument while you remained above?

A. I couldn't say.

Q. 23. I understand you, that you are positive that the sound which you heard came from the instrument.

A. Yes.

Q. 24. How many different talking machines did Mr. Drawbaugh show you at the time of your first visit with Mr. Updegrove.

A. It was—his apparatus then was a rather rough arrangement. It was a tin arrangement fastened through a board with a helix, I think inside of it. There was also another that looked about as much like a cuspidor as anything, only that it hadn't as much flange on top as a cuspidor. Then there was another machine there that had a horse shoe magnet—I don't remember the construction, and at the same time there was a tin box, or something like the lid of a box at the end of that. I think there was a mouth-piece or some kind of an opening at the end of that.

Q. 25. Please examine the instruments, "A," "B," "C," "D," "E," and "I" together with the "instruments B reproduced," "C reproduced," and "F reproduced," and state whether or not you recognize any of them as being the instruments which you saw, at the time of your first visit to Mr. Drawbaugh's shop in May 1874?

A. [*Witness takes up instrument* "*C*" *and says:*] My recollection is, this was the machine, but I think there was a magnet on it like this [*pointing to magnet on* "*C reproduced.*"] I think that is the very instrument. My impression is that the magnet on it was a little smaller than the magnet here [*referring to magnet of* "*C reproduced.*"] [*Witness then takes up instrument* "*B*" *and says:*] This is the instrument that I think I saw. [*Witness takes up instrument* "*I*" *and says:*] The cuspidor arrangement was something similar to that. I could not say whether that was the one. Those are all, I think, that I saw at that visit. There may have been more, but I don't remember. I won't to too positive.

Q. 26. Have you, or not, any recollection at that first visit of seeing instrument "A?"

A. I can't say. I have seen an instrument similar to this [*indicating* "*A,*"] but I could not say whether it was the first visit or the second.

Q. 27. Will you please examine all of said instruments once more, and state whether you identify any of them, and if so, which ones, as among the instruments seen by you at Mr. Drawbaugh's shop, at the time of your second visit there, to wit, the visit with Mr. Boyle, in April 1875?

A. I seen an instrument similar to that [*taking up* "*D*"]; that is with that peculiar shaped magnet. It resembles the external portion of the ear. That is the one I referred to before as resembling the ear. I saw something of this kind [*taking up* "*F*" *and* "*reproduced F*"]. I know that he was working with plaster-of-Paris, and was fixing something of this kind with plaster-of-Paris. I think I seen this instrument [*taking up* "*B*"]; in fact, I think I seen all the instruments here, or similar iastruments to them. That I do not think I saw [*referring to* "*B reproduced.*"]

Q. 28. I understand you that you saw this instrument "A" either at your first or second visit.

A. I think I did.

Q. 29. Do you remember which instrument you listened at when Mr. Drawbaugh was talking to you through the machines?

A. I don't know that I could identify that. We handled them all, and I couldn't say positively which ones—I couldn't say which ones I listened at.

Q. 30. When you listened and Mr. Drawbaugh talked into the other end of the line, could you distinctly hear and understand what he said through the machine?

A. Yes; I could hear so as to understand what he said.

Q. 31. Do you remember what particular machines you saw at the time of you third visit, when the fishing party were with you?

A. I think I seen them all.

Q. 32. Am I to understand you that on each occasion when you were there, Mr. Drawbaugh spoke of his want of funds and of his desire to get somebody to take hold with him and invest money to get the talking-machine patented and introduced.

A. That seemed to be the great trouble—the want of money. I think that each time he talked about his trouble, that he didn't have the money to patent it.

Q. 33. You have said that the subjects of electricity and mechanics generally were talked over at those times between you and Mr. Drawbaugh.

A. Yes; the subject of electricity seemed to be his hobby.

Q. 34. What particular machines or inventions of his did he seem to be most interested in and have most at heart?

A. His talking-machine.

Q. 35. Was there any conversation between you and him on any of those visits as to the distance through which he could talk by means of his talking-machine?

A. He thought he could talk as far as you could use the ordinary telegraph wire.

Q. 36. Was there any discussion as to what particular uses might be made of the invention, and how did that discussion arise, if there was any?

A. I thought it would be a grand thing for hotels. Instead of the electric bells, or the bell ropes, and instead of having anybody run up to the rooms for an order, they could talk it direct to the office.

Q. 37. What did Mr. Drawbaugh say about the particular uses that could be made of the machine, other than telegraping on long tines?

A. In running, for instance, from a house to a shop, or through a large factory, or from house to house. But in large factories, he thought it would be cheaper and to better advantage than the pipes that were run from floor to floor.

Q. 38. When did this part of the conversation take place,—at which visit?

A. The second visit was the general conversation. Everything that could be said about his invention was said, I think, that night; that is, on the second visit--the visit with Mr. Boyle.

Q. 39. Do you recollect whether Mr. Drawbaugh told you how long he had been working with talking-machines?

A. He said he had been working several years on it. I don't know that he mentioned the time, but I inferred that he had been working six or seven years on it, if not longer.

Q. 40. Were the talking-machines, that you saw then at his shop, operated by electricity?

A. Yes, sir.

Q. 41. Do you know how the Defendant's counsal, Mr. Jacobs, came to know that you had any knowledge of the invention of Mr. Drawbaugh?

A. Yes, sir; I think I do.

Q. 42. State how it was, and when.

A. I picked up a paper one day, or rather Mr. Boyle called my attention to an article in a paper, stating that that was the place, and the mill we had been at, and the machine we had talked through. Mr. Boyle was then a partner of mine in business in Philadelphia. That was in the neighborhood of a year ago. I talked frequently of this, and, I think, about six weeks ago I picked up a paper and seen the articles mentioning something of the case being tried here, or of taking testimony here. I talked with several people in the store about it and several of them advised me to write to Mr. Jacobs, or the attorneys, and let them know what I knew about it. I did. I wrote, stating the fact that I was acquainted with Mr. Drawbaugh, and knew of the machines being there, and if my evidence could be of any use they could have it.

Q. 43. Did Mr. Jacobs afterwards go to see you with reference to it?

A. Yes, sir.

Q. 44. Did you know whether Mr. Jacobs went to see Mr. Smith with reference to his visit there with you, and, if so, how Mr. Jacobs came to know about Mr. Smith, and when it was he became acquainted with him, and how?

A. I think he did. I told him that Mr. Smith was with me on one occasion over there fishing, and that he was acquainted with the working of the talking-machine, and that I thought he probably knew a good deal about it and would be an important witness. I can't say when he became acquainted with him, but it has been within the last five or six weeks. I suppose he became acquainted with him by going to see him in consequence of my statement.

Q. 45. When Mr. Jacobs asked you to come here and testify, did he ask you to bring your books and verify the dates?

A. He did.

Q. 46. Did you bring them?

A. I did not. I got them out to bring, but came out and forgot them. I left them lying on the desk in the store.

Q. 47. Did you examine them to verify the year and dates of your visits?

A. Yes, sir; on three or four or a half a dozen times.

Cross-examined by Mr. Storrow:

Cross-Q. 48. Why did you examine them so many times?

A. Mr. Jacobs was down to see me three times at least, that is he was in to see me three or four times when he was in the city; and each time he was there we looked over the books. I think he was in twice on one day.

Cross-Q. 49. What occasion was there for you and Mr. Jacobs to look at the books so many times?

A. He would ask me about the dates and I would look at the books.

Cross-Q. 50. Wasn't he satisfied with the answer you gave him the first time, when you looked at the books?

A. I think he was.

Cross-Q. 51. How long did you live in Harrisburg?

A. I lived in Harrisburg nearly four years.

Cross-Q. 52. When did you move away?

A. I moved my family away on the first day of February, 1877, but I had been away from early in the spring of 1876. All through Centennial year I was at Philadelphia, but my family was living here.

Cross-Q. 53. Where did you live in Philadelphia during the Centennial year, and what was your occupation?

A. At 215 Pine street. I was manufacturing revolving kaleidoscope lamps.

Cross-Q. 54. How long did you live at 215 Pine street, and where did you live next?

A. I lived there until I moved my family down in February, 1877. I boarded there and had my place of business there. I next lived on Fourth street, just above Pine; I can't remember the number.

Cross-Q. 55. How long did you live there, and where did you move to next?

A. I lived there one year, I think; I moved from there to Fourth street, just below Spruce; 337 is the number.

Cross-Q. 56. How long did you live there and where did you move to next?

A. I kept my place of business there until, I think, in—I moved my family, I think, three months before that—I think, in September of 1879—to Tenth and Callowhill.

Cross-Q. 57. How long did you live there and where did you move to next?

A. I lived there till the spring—I guess it was June of 1880, I think.

Cross-Q. 58. How long did you live there and where did you move to next?

A. I moved to Third and German.

Cross-Q. 59. How long did you live there?

A. I think I lived there until the tenth of August, 1880.

Cross-Q. 60. Where did you move to then?

A. 263 and 265 South Third street. It is all one property—a large double property.

Cross-Q. 61. How long did you live there?

A. I am living there now, or was when I left there Sunday morning.

Cross-Q. 62. How long did you carry on the business of manufacturing kaleidoscope lamps?

A. I carried it on up until some time after I moved my family down. I made them until some time in 1878.

Cross-Q. 63. What was the first business you took up after you moved your family down, in addition to those lamps?

A. I went into manufacturing silk and felt hats. I started a party in business there. He run the business.

Cross-Q. 64. What was the next business you took up?

A. The next business I took up was the shell business.

Cross-Q. 65. When was that?

A. That was shortly after I moved to where I now am. I did no business from December, 1879, up until August, 1880, except nurse my family. That was the time they were burned.

Cross-Q. 66. Where did you carry on the hat business?

A. On Fourth street; at both places where I lived. They were only a short distance apart. In the same buildings that I lived in. The stores were underneath and the dwellings were above.

Cross-Q. 67. Where did you live in Harrisburg?

A. I lived at Front and Market, and Fourth above Market, just next to the Express office. The first place I lived was Second, below Locust. 222, I think, was the number. I moved from there to Front and Market, then to Fourth and Market, and from there to Fourth, above Market, and from there to Philadelphia.

Cross-Q. 68. What was your occupation while you were living in Harrisburg?

A. Practicing medicine, or rather surgery. I made a speciality of diseases of the eye and ear.

Cross-Q. 69. What led you to devote your time to frog-fishing?

A. It rather run in the family, I think. I am rather fond of them to eat.

Cross-Q. 70. What was the name of the person you went to visit at Dillsburg, whom you have referred to?

A. I can't remember the name of the Dillsburg patient. It was on the other side of Dillsburg.

Cross-Q. 71. Didn't you find the name when you and Mr. Jacobs examined your books?

A. I did, but the entry was made of the time the operation was performed here at the White Hall Hotel. He stayed here a couple of weeks. The entry in my books is made of my visit to Siddonstown. I stopped there on my return from Dillsburg.

Cross-Q. 72. What was the name of the patient at Siddonstown?

A. Barbara Raffensberger.

Cross-Q. 73. At your second visit, which you say you made to Mr. Drawbaugh's shop, when you stayed there all night, what other things did you see besides the talking machine?

A. There was machinery there of different kinds—lathes, and wood turning machines, and tools that are generally used about a tinker's shop, where they made anything and everything. At that time I think he showed me an axle and told me they were going to start the manufactory and were fixing up for these wagon axles there in that building.

Cross-Q. 74. I wish you would name everything that you saw in the shop that night?

A. I seen some work benches, some files, drills, and an axe, some planes, chisels, rasps, lathes, pulleys, some of his talking-machines, plaster-of-Paris and some scrap iron lying around on the floor, some axles—two or three, I think,—some telegraph wire, some nails. There was an old coat hanging there, too. I took that down and laid on it. There was pieces of machinery lying around there that I didn't examine; some wood work. I could not tell what it was. In a shop of that kind it would puzzle a Philadelphia lawyer to tell what was in it.

Cross-Q. 75. What was the name of the Mr. Boyle who was with you?

A. Joseph M. Boyle.

Cross-Q. 76. When was he in business with you?

A. He was in the shell business with me from the fall of 1880, until the summer of 1881, when I bought him out.

Cross-Q. 77. Do you know what he did after he left you?

A. After leaving me he worked at printing in Philadelphia, at a printing establishment on Seventh street, below Race. I forget the name.

Cross-Q. 78. Do you know where he went after that?

A. He went from there to Cincinnati.

Cross-Q. 79. The first time you say you two stopped at Mr. Drawbaugh's shop, did you talk through any of his talking-machines?

A. I can't say positively that I did. I am rather under the impression that I did.

Cross-Q. 80. Which instruments do you think you used for receiving?

A. I couldn't tell you. I know I looked over the different ones, but I don't think I could tell which one we did use.

Cross-Q. 81. Which do you think you used at the time when you say you spent the night there?

A. We used them all. I think those, or machines similar to every one on the table, were used there. I could not say which ones were used, as it was a general discussion.

Cross-Q. 82. Can't you recollect the one you listened at?

A. I think that curled instrument ("D"), or something similar to that, was one that I listened at.

Cross-Q. 83. Did you listen at others?

A. Yes; I think I did. They were changed around—different ones during his talking—he took them off the wires—detached them and put on others.

Cross-Q. 84. Did you talk into any of the instruments on that occasion?

A. Yes, sir; I think that farthest machine there [*indicating* "C."]

Cross-Q. 85. Which one did he talk into?

A. I think in the same machine. In fact, I—I don't know—I think he had two machines, similar to "C."

Cross-Q. 86. Have you been at Drawbaugh's shop within the last six months?

A. Not until yesterday.

Cross-Q. 87. Who went with you yesterday?

A. Mr. Jacobs and I drove over, or rather I went with Mr. Jacobs. He drove me over.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 20th day of February, A. D. 1882.
FRED. M. OTT,
Examiner.

C. E. UPDEGRAFF.

February 21, 1882, 10, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for Complainants, and Mr. Hill and Mr. Jacobs for Respondents.

JOHN HENRY SMITH, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

I am almost forty-nine years of age; I live in the city of Philadelphia, at 1027 Buttonwood street; I am what you might call a cordwainer by trade, otherwise a shoe finisher. I have seen Daniel Drawbaugh, of

Eberly's Mills, Cumberland county, Pa., in May, 1875. I have not seen him since, except once in Philadelphia, about three or four weeks ago. I had no previous acquaintance with the man.

Q. 1. What business were you engaged in in May, 1875, and where?

A. I was engaged in the hotel busines, keeping the Valley House near the lower end of the depot, in the city of Harrisburg. It was the property of Mr. Kunkel, and I rented from him.

Q. 2. How long have you lived in Philadelphia?

A. The last time I moved from here, in September, 1880, just before the Presidential contest. Previous to that I had lived in Philadelphia—had been almost raised there. I moved from Philadelphia to Harrisburg, about July 3, 1866. I came here to take charge of Forney & Miller's shoe factory.

Q. 3. State the circumstances under which you first became acquainted with Mr. Daniel Drawbaugh, about the middle of May, 1875?

A. In the year 1875, Mr. Updegraff, Mr. Boyle, and I, being all residents here, and I having become acquainted with those gentlemen from their being visitors at my place of business, and I being fond of hunting and fishing, they having been over there three or four weeks previous, we made a party up and went over there and encamped for a night, and came home the next day. We left here in the afternoon and went over to Eberly's Mills, as some of us called it; others called it Milltown. We fished almost all night. I don't think the Doctor and I slept at all that night. On the next morning we built a fire and prepared our breakfast. We went up to a farm-house to get some milk for our coffee, and from there to a grocery store to get some other things that we needed. Doctor and I went—the others remained on the island where we were encamped. After we had provided what was necessary we went down and got our breakfast. The Doctor then proposed, after breakfast, that we should go up and see an old gentleman named Drawbaugh, who was a genius around there, who had something like a talking-machine. Doctor and I started from the island to the mill, leaving the others. None went but us two. Doctor went ahead and opened the door. On the first floor were a lot of shafting and pulleys, some iron lathes and rather heavy machinery. Mr. Drawbaugh was not there. We then went on to the second floor, which is more like a carpenter shop—a wood shop. Dr. Updegraff went in—Mr. Drawbaugh was in there—and introduced me as Mr. Smith, and we shook hands. He asked him, says he: "How are you getting along with your talking-machine?" The words that passed between them

I hardly recollect, but Mr. Updegraff and he went over to a bench, where he got out a number of these machines. I followed after them, out of curiosity, to see what they were. They looked over them and seen what they were. I had one or two of them in my hand. I didn't take the interest in them that Dr. Updegraff did, or Mr. Drawbaugh. I suppose we stopped in there a half an hour, or may be an hour; I am not positive as to the time. They were examining these instruments he was speaking of. After that we came out and wandered about there awhile and fished, and Doctor and I had a conversation about what Drawbaugh intended to accomplish by this machine. It was intended to convey sound from Philadelphia to New York, or Baltimore, or quite a long distance. I am positive I asked him how he knew, and he replied, "I have tried it; I have talked through it." He went on, "If he accomplishes what he expects to do with it, why he will make a fortune," and he, the Doctor, said he didn't think Drawbaugh had the money, and that some parties would probably get hold of it and make a good thing out of it.

Q. 4. Please look at the instruments "A," "B," "C," "D," "E," "F," "I," "F reproduced," "C reproduced," and state whether you recognize any of them as machines which you saw at the time of your said visit, or as being the same in appearance as machines which you saw?

A. There was one machine like "C" with a horse-shoe magnet on it like the one on "C reproduced." This one [*indicating "A"*] was one I had in my hand, and my thorough recollection of it was that it had a concern on it like the mouth-piece of a bugle—probably not this machine, but one just like it. I would not be willing to take my oath that this is the one. I think I have seen one like that [*indicating "D,"*] and something was there resembling a bomb-shell, [*indicating "I."*] I think I saw this machine [*taking the cover off "I" and examining it.*] I saw tumblers there, and asked him what he was doing with those tumblers. He had plaster-of-Paris, or something like that in that tumbler. This [*indicating "B"*] is not like the one that I saw. It had a piece of thin white skin or something of that kind covering this end. [*indicating the end of the tin can of "B" next to the electro-magnet*]. It looked to me like thin white bladder.

Q. 5. Do I understand you that you saw a machine very like "B," if the latterr had a piece of bladder over the end next to this electro-magnet?

A. Yes, sir; the reason for remembering that was that this part [*indicating the tin case of "B"*] seemed to be made out of tin. "B," "C," and "I" are the tumblers I particularly remember; the others I wouldn't be positive about.

Q. 6. I understand you that you remember seeing a machine that looked like "A," although you would not swear that "A" was the same machine?

[*Objected to as leading.*]

A. Yes, sir.

Q. 7. Do you remember that the machine that you saw that had a mouthpiece like a bugle was a flat round machine with a mouth piece on one side of the centre?

[*Same objection.*]

A. It was a round piece like this—[*taking "A" in his hand*]—and had a mouthpiece like this on it.

Q. 8. Is there anything about the machine "D" that calls to your recollection any instrument that you then saw there?

A. There is nothing particularly about this that makes me remember any more than I would remember a machine by picking it up. I almost forget whether there was a piece in it—[*witness looking into the mouthpiece while stating the last clause above.*] It looks to me like a machine of this kind that I had seen over there.

Q. 9. Please look at the permanent magnet on instrument "C reproduced" and state how that compares with the magnet which you say you saw on the machine "C?"

A. This magnet, not having it in my hand, but only looking at it as I do now, looks to me to resemble the one that I saw there.

Q. 10. Please look at the electro magnets on machine "C reproduced" and state whether you have any recollection of anything of that kind being on the machine "C" between the permanent magnet and the tin?

A. I have a distinct recollection of two spools-full of a white substance—I couldn't say whether it was thread. They were in the same position that they are there; but I couldn't say whether they were fastened down by a screw or not. I couldn't say because I did not take them in my hand. I judge they were fastened down. I simply watched their movements as they explained to eachother just as I am standing here now—Mr. Drawbaugh explaining to Mr. Updegraff. I am satisfied they were not loose, for we had them in our hands handling this way [*indicating*] and they would have rolled off if they had been loose. I meant by not having them in my hand that I did not have the spools in my hand, and did not attempt to take them off. I had the machine in my hand.

Q. 11. Do you remember whether the permanent magnet was loose as it is here, on "C reproduced?"

A. I do not, sir.

Q. 12. Have you ever been in that shop since that visit of May, 1875?

A. Never, sir, before or since.

Q. 13. Referring to the conversation which you had with Dr. Updegraff on the same day after you went out of the shop, was there any talk in that conversation about the particular uses which the machine was adapted to?

A. There was this about it, that during the conversation Dr. Updegraff told me that a person could have a concert, or something of that kind, in New York, and you could sit in your own house at Harrisburg and hear as well as if you were there. That is what he conveyed to me was the intention of the talking-machine. It was a machine to carry sound a long distance.

Q. 14. Was there anything said in that conversation about the use of the machine for short lines for any purpose?

A. That I could not say, sir.

Q. 15. Was the machine referred to in your interview with Drawbaugh, and in your conversation with the Doctor on the same day, as a machine which would convey spoken words a long distance or only musical sounds?

[*Objected to as leading.*]

A. I had understood it to do both—as a machine that you could talk through as well as you could hear singing.

Q. 16. In one of your answers referring to the conversation which you had with Dr. Updegraff after you left the shop, and on the same day, you state that the Doctor said, "If he," meaning Drawbaugh, "accomplishes what he expects to do with it, why he will make a fortune." From the conversation at the time, what did you understand the Doctor to mean by Drawbaugh accomplishing what he expected to with the machine?

[*Objected to as hearsay and incompetent.*]

A. My impression was that, should the machine get into general use, the machine would be financially a success. That was the impression I got from the conversation.

Q. 17. Then, what Drawbaugh expected to accomplish was to get the machine into general use, is that your idea?

[*Objected to for the same reasons as above, and as leading.*]

A. That was my idea.

Cross-examined by Mr. Storrow:

Cross-Q. 18. In your 3rd answer, you say that when Mr. Updegraff and Mr. Boyle proposed to you to go with them on the occasion you have described, they had been over there three or four weeks previous. Do you refer to an excursion in which Dr. Updegraff and Mr. Boyle floated down stream in a canvass canoe, and which Dr. Updegraff described in his testimony yesterday?

A. As regards the canvass boat, I was not along; but as regards their excursion for frog-fishing, that is the visit there three or four weeks previous that I refer to. As to the boat, I was not there, and I did not hear his testimony in regard to that at all. At that time I was out.

Cross-Q. 19. You were present during most of last evening while Mr. Updegraff was testifying, were you not?

A. Yes, sir; part of it. I forget the time. I think it was in the neighborhood of 11 o'clock.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 21st day of February, A. D. 1882.
FRED. M. OTT,
Examiner.

J. H. SMITH.

THOMAS UPDEGROVE, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

My age is forty; residence, Harrisburg; occupation, carpenter.

Q. 1. How much acquaintance have you with Mr. Drawbaugh?

A. Nothing but what few words I spoke to him in the mill or shop.

Q. 2. How many times were you over at his shop at Eberly's Mills?

A. Once.

Q. 3. When was that?

A. That was in the spring of 1874.

Q. 4. Are you able to fix the exact day?

A. I would be now, but I would't have, only on account of one circumstance.

Q. 5. What circumstance was that?

A. Asking Mr. Cummings whether he had the day that Mr. Updegraff hired the carriage from him.

Q. 6. State how you happened to visit Mr. Drawbaugh's shop at that time.

A. Dr. Updegraff asked me if I would take a ride with him to see a patient of his, and we would take a gun along. I said I would. We went to Dillstown, and five mills beyond Dillstown. We took dinner there, and he attended to his patient. We started from there after dinner to Siddonstown, and stayed there over night. In the morning, we started for Harrisburg. He had a patient in Siddonstown; I forgot to say, a lady there. We stayed with them over night. On our way back, we got to this mill. Doctor got into conversation with this gentleman, and we got up into the shop and there he was explaining some machinery to the Doctor. We stayed there a while—I couldn't state how long—and started then for home.

Recess for dinner until 2, P. M.

Feb. 21, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present, same counsel.

Examination of Thomas Updegrove by Mr. Hill continued:

Q. 7. Is the town beyond which you went on that trip sometimes called Dillstown and sometimes Dillsburg?

A. Yes, sir; I have heard it called both.

Q. 8. Is the same true of Siddonstown? Is it sometimes called Siddonsburg?

A. Indeed, I don't know. I was never in the town before.

Q. 9. Please look at the instruments now on the table, marked "A," "B," "C," "D," "E," "F," "I," and "reproduced C," and "reproduced F," and you state whether you recognize any of them as being instruments that you saw at Mr. Drawbaugh's shop on that visit, or as being similar in appearance to instruments which you saw there?

A. I saw something like that [*taking up* "*B*"]; I couldn't say whether it was this one; but it was something very much like it. I remember the tin part and this here [*taking up* "*I*"]—I remember this very distinctly. I seen a machine like this also, [*taking up* "*reproduced C,*"] I don't know whether this is the one, but it was something in that order, with a magnet on like that. I don't recollect anything at all about that one [*indicating* "*F.*"] These things here [*indicating* "*A,*" "*D,*" "*C,*" *and* "*reproduced* "*F,*"] I never saw—not to my knowledge.

Q. 10. Please look at "reproduced "C" and state whether the machine which you saw there resembling this one and having a magnet on it had also the spools wound with something arranged between the magnet and the tin, or do you remember that?

A. The spools—I recollect those. I could not state whether they were wrapped or how they were fixed; it was so long ago; but I can say it resembles what I seen.

Q. 11. Do you remember whether the spools you saw there on the machine were between the magnet and the tin?

A. I couldn't say exactly in regard to that; I didn't take very close observation.

Q. 12. How did the magnet compare with that magnet on "reproduced "C."

A. It was about that shape; as to the size, I could not say; it was a "U" magnet.

Q. 13. Did you remain in the room with Dr Updegraff and Mr. Drawbaugh during their entire conversation, or not?

A. No, sir; only part of the time?

Q. 14. Were you there during the first or last part of their conversation?

A. The first part. I went out then and waited until he came. I didn't feel interested in the machinery, as I didn't think it would amount to anything.

Q. 15. Have you any knowledge on the subject of electricity?

A. No, sir.

Q. 16. Do you remember whether Mr. Drawbaugh, at that time, stated that it was operated by electricity or not?

A. I wasn't paying altogether particular pains to their conversation; I was fidgeting to get home; I was in more of a hurry than Doc. was; I do not remember.

TELEPHONE COMPANY,-2

Q. 17. Did anybody talk through the machine while you were in the shop examining them, with Mr. Drawbaugh and the Doctor?

A. They were doing something with them just as I was about going out. They were putting them in some kind of shape, or doing something. I went out to where the horse was, and I don't know whether they talked through them or not.

Q. 18. Where were the machines when you and the Doctor first went into the shop?

A. They were on the work-bench.

Q. 19. After the Doctor came out of the shop I suppose you and he came immediately home, did you?

A. Yes, sir.

Q. 20. Did you have any conversation with the Doctor about the machines, as you were going home?

A. Yes, sir.

Q. 21. What did the Doctor say to you about them?

[*Objected to.*]

A. He said it was a very ingenious kind of a thing. He thought it would answer for some purposes, but didn't think it likely to answer for all the purposes that Mr. Drawbaugh expected it would. He said that talking from one town to another was more than he thought it would do. It might do in hotels, he said.

Q. 22. Did he tell you that he had talked through it or heard Mr. Drawbaugh talk through it while they were in the shop together?

A. I understood from his conversation in the carriage that he had some idea of its working.

Q. 23. He might have gotten some idea of its work from Mr. Drawbaugh's statements. What I asked was whether the Doctor told you in the carriage as you were going home whether he, the Doctor, had talked or listened through it or not?

A. I can't recollect that he did.

Q. 24. Do you remember whether you inferred that he had from his conversation?

A. I can't say, but he appeared to have some idea of it. That is all I can remember now.

Cross-examined by Mr. Storrow:

Cross-Q. 25. Where do you live now?

A. 305 South Second street.

Cross-Q. 26. Where do you work now?

A. I am working for myself now.

Cross-Q. 27. Have you got a workshop of your own?

A. No, sir; I had two years ago.

Cross-Q. 28. How long had you known Dr. Updegraff before you went on this expedition with him?

A. Since about 1868.

Cross-Q. 29. How much had you known him?

A. Very little in 1868. After 1870, I knowed him continually—was with him a great deal. He doctored me.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 21st day of February, A. D. 1882.
FRED. M. OTT,
Examiner.

THOMAS UPDEGROVE.

[*Mr. Hill states that Mr. Storrow yesterday requested that Harmon K. Drawbaugh, a witness heretofore examined for Defendants, and whose deposition was closed, be reproduced for the purpose of allowing Mr. Storrow to ask some ten or twelve additional questions. Mr. Hill now recalls the witness for that purpose, but not for a general cross-examinatian, nor for a cross-examination upon matters upon which he has already been cross-examined in his former deposition.*]

HARMON K. DRAWBAUGH, *recalled.*

Cross-examined by Mr. Storrow:

Cross-Q. 1. Did you testify as a witness in the interference case between David A. Hauck and Daniel Drawbangh?

[*Objected to by Mr. Hill as irrelevant, immaterial, and as matter not referred to in the direct examination.*]

A. Yes, sir.

Cross-Q. 2. I now hand you what purports to be one of the original printed copies of the evidence on behalf of David A. Hauck in said case, and ask you to look at what is printed as your deposition therein, beginning on page 8 and ending on page 24, and to state whether the statements therein contained purporting to be made by you are correct and true, according to the best of your recollection, and if they are not, will you please to make any correction or explanation which you may desire?

[*Objected to as immaterial, irrelevant, and incompetent, and as matter not referred to in the examination-in-chief, and the deposition in the Hauck case is objected to for the same reasons, and because this method of introducing it is entirely irregular.*]

[*Witness reads the deposition and says:*] I don't think there is anything in there that I would wish to correct.

[*Complainant's counsel puts in evidence said printed deposition referred to by the witness, to be marked "Exhibit H. K. Drawbaugh's deposition."*]

[*The introduction of the deposition objected to by Mr. Hill for the same reasons above stated.*]

Examination taken, reduced to writing, and by the witness subscribed to before me, this 21st day of February, A. D. 1882.
FRED. M. OTT,
Examiner.

H. K. DRAWBAUGH.

Adjourned until Feb. 23, 1882, at ten, A. M.

Feb. 22, 1882, at 7:30, P. M.

Examination resumed pursuant to adjournment, by consent.

Present, Mr. Storrow for Complainants and Mr. Hill for Respondents.

WASHINGTON SUTTON *being produced, affirmed and examined, saith:*

Examined by Mr. Hill.

My age is sixty-one. Residence Lewisberry, York county, Pennsylvania. Occupation, blacksmith by trade, but I am not doing anything now. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania. I never seen the man to know him till 1873. I went there to his place in 1873.

Q. 1. Were you ever at his shop at Eberly's Mills before or since that visit?

A. I was not.

Q. 2. What time in 1873 was it when you were there at his shop?

A. I can't get at the time, but some time in August. That is the nearest I can get at it.

Q. 3. How do you fix the year as 1873.

A. I had a sale—I know it to be the exact time for I have a note in my pocket that was given at my sale, and I moved to York the fifth day of April; and it was that same summer.

Q. 4. Please hand the note to the examiner that he may make a record of it?

(*Witness hands note to the examiner; copy of the note is as follows:*

"$7.00. LEWISBERRY, YORK COUNTY, PA., *March* 24, 1873.

Twelve months after date, we, or either of us, promise to pay Washington Sutton or order, the sum of seven dollars, without defalcation, for value received, hereby waiving our right to all laws exempting property from levy and sale.

(Signed) HENRY T. WISE.
D. N. BAYLER.")

A. The body of the note is in the handwriting of Thomas Groome, of Carlisle.

Q. 5. Was that note given for things that you sold at your sale?

A. Yes, sir.

Q. 6. Has the note been paid?

A. No, sir.

Q. 7. What did you go to Mr. Drawbaugh's shop for on that occasion?

A. To buy a turning lathe that he had.

Q. 8. Did you buy the lathe. If not, why not?

A. I didn't buy it. He told me that he had sold the lathe, or bargained to sell it to a man at Mechanicsburg, named Hauck.

Q. 9. While you were at Mr. Drawbaugh's shop on that occasion, did you have any conversation with him about talking machines, or see any talking machines?

A. Yes, sir; and I saw talking machines.

Q. 10. Did you talk through the talking machines at that time, or hear anybody talk through them?

A. I didn't talk through them, but he did, and told me what he could do and all with it; that he could do and all with it, that he could talk to his house, and they could tell him to come to dinner, and he could understand it.

Q. 11. When he talked through the machine for you, could you hear and understand what he said through it?

A. That is something that I can't exactly answer. I think that I told my folks when I came home that I did. But for me to say now, that I did I could not say. I don't remember. He had so many things that he was showing me there that I could not recollect. I think I told it to my nephew that I had seen a curiosity, and it was too.

Q. 12. Do you remember whether the machine impressed you at the time as being a very excellent invention or not?

[*Objected to.*]

A. I remember it did.

Q. 13. Do you remember whether you and Mr. Drawbaugh were in the same room when he was talking to you through the machine or not?

A. We were not. I cannot tell whether the machine was up stairs or not. But when we talked through it we were on different floors. That I recollect about very particular.

Q. 14. Did Mr. Drawbaugh at any time say anything to you about his financial condition. If so, what?

[*Objected to as hearsay.*]

A. I asked him why he didn't get it patented, and he said he wasn't able. That was about the way I understood him—that he wasn't able to get it done; nothing else that I recollect of.

Q. 15. What did you understand at the time by his saying that he was not able? That he had not sufficient money to do it?

[*Objected to.*]

A. Of course. That is the way I understood it, from the way he spoke.

Q. 16. Please look at the machines "B," "F," "C," and "I," and "B reproduced," and "C reproduced," and say if you can identify any of them as machines which you saw at Mr. Drawbaugh's shop at the time of that visit?

A. I seen this here [*indicating* "*C reproduced*"]. That there [*indicating* "*C*"] looks like it. I recollect particularly the permanent magnet, and that [*pointing to the brass on the top of the electro-magnet*], and that [*pointing to the mouth-piece of* "*C reproduced*"]. I might have seen all them things [*pointing to the various machines on the table*], but I can't recollect anything but this one and something that looked like that [*pointing to the electro-magnet on* "*B*"]. If you went in his shop and seen everything he had, you wouldn't wonder that I don't remember. This here [*taking up* "*reproduced B*"] is like something I seen there. I did expect to see the battery here, but that ain't there. It was a glass battery, with fixtures.

Q. 17. Was the talking-machine connected to the battery or not?

A. Yes, it was. There was a wire that connected it.

Q. 18. Do you remember how many wires?

A. No, sir; I do not.

Q. 19. When Mr. Drawbaugh talked to you through the machine, did you listen at a machine like this [*indicating* " *C reproduced* "]?

A. I can't tell exactly. I can't recollect whether I heard anything through it, but if I did, it was a machine like this here [*indicating the mouth-piece of* " *C*"]. I can't tell. That has slipped my memory, but I know I had to go upstairs and down when he talked through the machine.

Q. 20. Do you remember whether the wires were drawn tight or were hanging loose?

A. I think they were hanging loose. I couldn't be certain about that.

Q. 21. Did Mr. Drawbaugh tell you at the time that the machine was worked by electricity or not?

A. Yes, sir; he did.

Q. 22. Where did you live at the time of your sale, and before you moved to York?

A. I lived in Lewisberry before I moved to York.

Q. 23. Then you moved from Lewisberry to the town of York in April, 1873?

A. Yes, sir.

Q. 24. Where did you first see one of these telephones that are used in the cities?

A. At Baltimore.

Q. 25. When?

A. A little over two years ago, but I heard of them before that.

Q. 26. What remark did you make when you first saw or heard of them?

A. I said that if it ever was patented, Dan. Drawbaugh had a right to have the advantage of it, for I had seen it there several years before that—in 1873, when I was there.

Cross-examined by Mr. Storrow:

Cross-Q. 27. Where did you live now?

A. At Lewisberry, the place I lived before I moved to York.

Cross-Q. 28. Where did you live in York?

A. Chestnut street. I can't tell you the number, but it was right close to the jail.

Cross-Q. 29. Which way from the jail?

A. About a hundred yards south-west.

Cross-Q. 30. How long did you live at York?

A. Two years and two months to the day.

Cross-Q. 31. What was your business there?

A. I worked in a machine shop, and the rolling mill, and blacksmithing.

Cross-Q. 32. What machine shop?

A. The Northern Central Railroad shop.

Cross-Q. 33. What rolling mill?

A. I think they call it the York Steel Rolling Mill.

Cross-Q. 34. What was your business at Lewisberry?

A. I worked all the time I lived there at blacksmithing, and tried to keep store a few years. I am in no business now.

Cross-Q. 35. When did you keep store?

A. I kept store there before I moved to York.

Cross-Q. 36. How long since did you give up blacksmithing?

A. I haven't given it up altogether yet. I work at it at odd times, but not so as to amount to anything. Not since I moved from York.

Cross-Q. 37. Who did you see at Drawbaugh's shop at the time you say you went there?

A. Daniel Drawbaugh.

Cross-Q. 38. Who else?

A. I seen no one else there but myself and him.

Cross-Q. 39. How long did you stay there?

A. I was there about two hours and a half, I guess.

Re-direct by Mr. Hill.

Cross-Q. 40. Whose horse and carriage did you have when you went there?

A. I had my nephew's horse and sulky.

Cross-Q. 41. Your nephew is here at present, is he not?

A. Yes, sir. His name is R. B. Sutton.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 23d day of February, 1882.

FRED. M. OTT,
Examiner.

WASHINGTON SUTTON.

RANKIN B. SUTTON, *being produced, affirmed and examined, saith:*

Examined by Mr. Hill.

My age is 41; residence Lewisberry, York county, Pennsylvania; occupation, carrying on the earthenware manufacture. I have never seen Daniel Drawbaugh to know him but twice or three times, I think.

Q. 1. You have been present while your uncle, Mr. Washington Sutton was giving his deposition here this evening, were you not?

A. Yes, sir.

Q. 2. Do you remember the year in which he moved from Lewisberry to York?

A. Yes, sir.

Q. 3. What year was it according to your recollection?

A. 1873.

Q. 4. Do you remember the circumstance of his visiting Mr. Drawbaugh's shop?

A. Yes, sir.

Q. 5. What time was it, to the best of your recollection?

A. As near as I can tell it was in August. I may probably vary a month—it was in 1873.

Q. 6. He borrowed your horse and wagon to go there, did he not?

A. Horse and sulky. Yes, sir.

Q. 7. When he brought the horse and sulky back, do you remember whether he said anything about what he had seen at Mr. Drawbaugh's shop during his visit?

A. Yes, sir. I can.

Q. 8. Did he mention anything about seeing a talking machine there?

A. Yes, sir. He did.

Q. 9. What did he say about it?

A. He said that Drawbaugh had invented a machine that was a curiosity—something that he had never before seen. He said that he had a machine invented, or partly invented, that he could talk by electricity—by attaching a wire to electricity; that he could understand what he said, or he could talk so that they could understand him—he could talk so that his family could understand him at the house while he was at the shop, himself.

Q. 10. Did he say whether he had heard Mr. Drawbaugh speak through the machine while he was there on his visit to the shop?

A. Yes, sir. He did.

Cross-examined by Mr. Storrow.

Cross-Q. 11. When did you first know Mr. Drawbaugh?

A. The first that I ever did know him,—and that was only by hearsay,—was about a year ago. I know I saw him then, but I was first introduced to him to-day.

Cross-Q. 12. Where did you see him then?

A. I saw him at Lewisberry.

Cross-Q. 13. Whereabouts at Lewisberry?

A. I saw him at Lyman Shettel's house—talking to Lyman Shettel.

Cross-Q. 14. Where were you at the time?

A. Opposite, across the street, at John Grove's store, it is now; it was R. M. Wright's store at the time I saw him.

Cross-Q. 15. What else did your uncle tell you that he had seen or heard at Drawbaugh's shop?

A. He had talked concerning a large clock that he had invented, that run, if I mistake not, by electricity.

Cross-Q. 16. What did he tell you about the clock?

A. I do not remember a great deal more than he claimed that it was very fine work.

Cross-Q. 17. How big did he tell you the clock was?

A. I don't remember that he told any size of the clock.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 22d day of February, A. D. 1882.
FRED. M. OTT,
Examiner.

RANKIN B. SUTTON.

By consent, adjourned to meet in Philadelphia, at the Continental Hotel, on Wednesday, March 1st, 1882, at ten o'clock, A. M.

March 1st, 1882, *ten o'clock*, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

W. H. DECKER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is forty-one years; my residence is 1118 Poplar street, Wilmington, Delaware; occupation, iron-worker; I am called a roller, and am employed in the Combination Iron and Steel Works of Roach, Weed & Co., at South Chester. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna., and have known him since 1873.

Q. 1. Are you the foreman of the works, or any part of it, where you are working?

A. Yes, sir; I have charge of one train of rolls—called the twelve-inch train of rolls.

Q. 2. How long have you lived at Wilmington?

A. Going on three years.

Q. 3. Where did you reside prior to going to Wilmington?

A. At West Fairview, Cumberland county, Pennsylvania.

Q. 4. For whom did you work at West Fairview, and how long?

A. For Col. Henry McCormick. I went in February, 1872, and worked up till December, 1877.

Q. 5. In what mills?

A. In the first place I was hired by my uncle to go there to start the double turn on the nail-plate-mill; to roll the nail-plate for the nailers. That was in February, 1872. That was the first time the double turn was ever started there. They had always run single turn before.

Q. 6. Were you ever at the shop of Daniel Drawbaugh, at Eberly's Mills. If so, when first?

A. In August, 1873.

Q. 7. How do you fix the time?

A. In May the double turn didn't run so very well for the first start off. I goes to Lancaster to start a new mill—a bar-mill, to roll bar-iron. I worked up to July 17th, when, there being a reduction of seven *per cent.*, I concluded I wouldn't work. I could do better at home, as the double turn was going to run again. The double turn didn't start right away, and I knocked around home. My friend, Mr. Hiram Dunbar, frequented the mill every day, as the double turn was supposed to be starting pretty soon—he running eight self-feeding nail-machines. He got talking about the self-feeders. He says: "You ought to go down and see Drawbaugh's self-feeder, that he had there some time ago." I says, "Where is this Drawbaugh?" He said, "Down at Eberly's Mills," giving me the directions how to go. I told him I would go down there some day, so I went down there about the middle of August, as near as I can judge. That was the first time I had known Drawbaugh.

Q. 8. How long were you at his shop at that visit?

A. To the best of my knowledge, about any hour. About twenty-five minutes of that, I think, I spent down the cellar examining the nail-machine. Understand that nail-machine was on blocks at the time. It wasn't running at the time, but was so situated that he could put the power to it and run it any time. I didn't see it running.

Q. 9. What was you doing the rest of the time, while not examining the nail plate-feeder?

A. I came upstairs to the second story. I walked into the second room—there is an ante-room as you came upstairs. I says, "I saw your nail-machine." He said, "What do you think of it?" I told him I didn't know what to think of it till I seen it run. That question dropped there. Then I says to him, "I see you are buisily engaged here." He says, "Yes, I am always making something. He turned around to his work then. He was busy at the bench doing some work.

Q. 10. Did you, or not, at that time, see any talking-machines at his shop?

A I saw the oyster can,—or a tin cup that I called an oyster can,—on a piece of board, and the glass tumbler filled with something white.

Q. 11. Did you have any talk with him about the talking machines at that time?

A. Looking around some little time, I put my hand on this tin can. I says, "What do you call this?" "Oh," he says, "we are going to talk through that some of these days."

Q. 12. Did he at that time make any explanation to you about the machine—how it operated, or not?

A. He went on to explain about the electricity, but of course I didn't understand it. I wasn't posted on that branch of it—on that art.

Q. 13. Were you at Daniel Drawbaugh's shop afterwards? If so, when was your next visit?

A. In 1874.

Q. 14. What time in 1874, and how happened you to go there at that time?

A. I think it was at the commencement of the fall, if my memory serves me right. Mr. Kline being a blacksmith in our town when I first came there—I don't know his first name—was around my father-in-law's hotel. He had a patent spindle for a sewing machine. This was Mr. Kline's own patent. It is to take up the lost motion of the driving-wheel—the wheel where the belt goes round. He said he had got a lot made in Allentown, and they were going to have them finished up at Milltown. My father was living with me at the time. Understand, Mr.

Kline lived over at Camp Hill at that time, or over in that neighborhood some place. I got talking to my father about this spindle of Mr. Kline's. My father says, "You had better go over and see him some day." I told my father I though there was some money in this spindle, and I would go over and see whether I couldn't buy some territory. I thought Allegheny county would be a good territory for him to buy. I went over and seen him. I saw the spindle, and had a talk with Mr. Kline about it. He said he couldn't say much about it—they were going to put in machinery there to manufacture spindles themselves, some of these days.

Q. 15. Were you talking of buying territory for yourself or for your father?

A. For my father. He lived in Hollidaysburg, Blair county, at the time. He was stopping with me. It would be handier for him to go to Pittsburgh, as he lived a little over a hundred miles from there. That was the reason I thought Allegheny county, which includes Pittsburgh, would be a good territory for him to have. As he was an elderly man, I thought it my duty to try to get him something to do so that he would not have to work so hard as he did when he was a rolling-mill man.

Q. 16. Where did you see Mr. Kline on that visit?

A. At Mr. Drawbaugh's shop, at Eberly's mills, outside, at the foot of the steps.

Q. 17. Did you see Mr. Drawbaugh at that visit?

A. Mr. Kline said I must excuse him, as he had to go up to the Soldiers' Orphans' School to see his son-in-law, Captain Moore, and that he would see me at some other time. Mr. Kline left me, and I walked upstairs, and walked right through into the shop, where Mr. Drawbaugh was. I says, "I see you are busy all the time." He says, "Yes, I must work." Then he went on—he had something in a vise—filing there. I looked around a few minutes, and seen several things laying around on the benches. I picked up one of them, and was looking at it. He says to me, "I guess you don't know what that is?" I says, "No, sir." He says, "That is some more of my talking machines." —I still had it in my hand, turning it over and looking at it. He turned and went towards the other end of the building—pretty near the other end. I still had it in my hands, and put it up to my mouth—thought I could talk, or do something of that kind. He says, "Put it to your ear." I put it to my ear, and the sound came. "What is your name?" he says. "W. H. Decker," I says. Another sound came, "Where from?" "West Fairview," I says; another sound came—says, "Do you know Jake May?" I says, "Yes, sir." He took the part that he had somewhere over there and said, "What do you think of that?" I said, "I think that is a queer kind of a thing." He said, "That is the way we are going to talk to the people some of these days." I said, "I don't see how you are going to do that." Then he went on to explain about the electricity and the magnet, and while I had it in my hand—the circle there—I said, "Well, is this where the vibration came from? is this where the sound came from?" "Oh," he said, "that will be all right some of these days."

Q. 18. You spoke of hearing the sound come "What is your name?" "Where from?" and "Do you know Jake May?" How did you hear those sounds, through the instrument, or through the air, directly from him.

A. Through the instrument. I had it up to my ear. I couldn't hear from him directly through the air, as he was too far from me,—at the opposite end of the building,—and he talked low.

Q. 19. When you answered back to him, did you answer through the instrument or through the air?

A. Through the air.

Q. 20. Was the instrument that you held to your ear connected in any way to the instrument that he had? If so, how?

A. There were several wires running along the wall, and there were wires on the one that I had—small wires.

Q. 21. Were those wires connected to the instrument when you first took it up, or did he make the connection afterwards?

A. The wires were connected to it when I first picked it up.

Q. 22. Did you ever visit his shop afterwards. If so, when did you next visit it, after the fall of 1874?

A. In 1875.

Q. 23. Can you state at what time in 1875?

A. About the latter part of August.

Q. 24. How came you to make that visit, about the latter part of August, 1875?

A. My father went home about the holidays—I mean Christmas of 1874—during that year he read a great deal of chemical books, while he was doing nothing. He came to me in March again, and said he thought they had discovered a water-proof grease. In May I gave him part of the stable, and gave him money to buy the materials, that he wanted to make the grease. I got Mr. Hood, the tinner in our town, to make a couple of hundred of tin boxes for me,—small boxes, of cheap tin. My father put his grease that he had made in them, and I gave it away to my friends to try, and tried it myself. My friends, that I had gave it to, to put on harness, put it on the harness, and found that it made it pliable. I gave it to Mr. Dunbar to put on his driving buggy. I gave Silas Gleim a box, to try on his driving buggy. I gave Barney Wilder a box, to try on his buggy, when he kept the Bridgeport Hotel. I asked Mr. Dunbar, in a couple of weeks, what he thought of the grease. He said he thought it was first-rate. I asked Silas Gleim, in the meantime, what he thought of the grease—and he done a good bit of driving, himself, Silas did—said he, "I think it is the very thing;" he said, "I put it on my spindle, and it winds around like very fine thread, on the spool, and stays on the spindle." Hearing a good report of it all through, and people coming to buy it, I got my father to manufacture more, and bought more boxes and labels. I took some to Marysville, to Mr. Foland—five or six dozen—and left them on commission with him. I took some to Duncannan, some to Harrisburg, to two or three stores. I sent some to Northumberland; and in August I went over there to Camp Hill. I took some over to White Hall. I talked to Captain Moore, and told him I was going down to see his father-in-law, who was then down at the mill. I went there and saw Kline and gave him a box down there, and told him I thought it would be the very thing for his spindle; to try it on. I was in the shop and talked to Dan. Drawbaugh. I says, "How are you getting on with your talking-machine?" "Oh well," he says, "If we had a wire to Fairview, we could easily talk to you people up there."

Q. 25. When you were down there at Drawbaugh's shop, about the latter part of August, 1875, as you have testified, do you remember whether they were making Kline's patent axles there at the shop?

A. They were fitting them up. They had them forged somewheres, and they were fitting them up themselves there at the shop.

Q. 26. At that visit, in 1875, did you see any talking-machines there at the shop?

A. Yes, sir; plenty of them, on the bench and on the walls—at least, what they called talking-machines.

Q. 27. By "on the walls," what do you mean? Explain yourself.

A. Some were fastened up against the wall, and some were on the benches. The bench was up to my stomach, as near as I can judge. I leaned against the bench.

Q. 28. Did you, at that visit, talk through the talking-machines or not?

A. No, sir; I did not talk, but Mr. Drawbaugh talked to Mr. Kline through the talking-machine, and I stood right alongside of Mr. Kline, right against the bench.

Q. 29. Did anybody talk to you through the talking-machine at that visit?

A. Yes, sir.

Q. 30. Who talked to you through it?

A. Daniel Drawbaugh.

Q. 31. Could you hear and understand, through the machine, what he said.

A. Yes, sir.

Q. 32. Have you any recollectihn of what was said, through the machine, to you at that time?

A. Yes, sir.

Q. 33. State what you remember of it.

A. "How is my old friend, Jacob May, and his family?" he says. I said, "They were all well when I last saw them." He says, "I understand there is an increase in the family." I told him I wasn't posiive of that, and couldn't give him no positive answer. He says, "Well, they are all well, so far as you know?" I said, "Yes, sir." He said, "I am much obliged."

Q. 34. Where was he when this conversation through the machine was going on?

A. At the back part of the building, in a small off-set of the building, where he kept something.

Q. 35. By an off-set, do you mean a small room?

A. A small room; yes, sir.

Q. 36. Was he in the small room?

A. Yes, sir; right by the door.

Q. 37. Did you hear what he said through the instrument or through the air?

A. Through the instrument.

Q. 38. Did you answer back to him through the instrument or through the air?

A. I said to Mr. Kline, "Can I talk through this?" That is when

AMERICAN BELL TELE

Mr. Kline handed me the instrument. Daniel says, "Take this instrument." "Oh!" said Mr. Kline, "yes, you can talk anything you want to talk." I answered back through the instrument.

Q. 39. Were you there at the Mr. Drawbaugh's shop after that time? If so, how long after that?

A. I was there in 1877.

Q. 40. About what time in 1877 were you there?

A. I can't just fix the date. It was just about a couple of weeks after I had gone to Harrisburg to see the Hazleton clock that was exhibited there. It was in warm weather, but I can't fix the exact time.

Q. 41. Please state what you refer to by the Hazleton clock being exhibited in Harrisburg.

A. Being over in Harrisburg on Saturday afternoon, after getting done work, I saw an advertisement on Third street, near Walnut, of the "Great Wonderful Clock." I saw, "Admission, ten cents to see the great wonderful clock, the wonders of the world." I goes in and sees the clock. A young man, having it in charge, was giving an account of all its working, and how long it took to get it up—by this man in Hazleton, the inventor. On Sunday morning, after I got my breakfast, I went up into Jake May's shop, and told him what I had seen in Harrisburg. He says, "Daniel Drawbaugh has got one done and is making another one, and we will go over there some time and see it." I says, "All right; the first idle day I have, I will go with you." About two weeks, or thereabouts, after that, the rolls had to be turned. It took me about three hours in the morning to get the rolls out, and get things in proper shape. So, as I came up from work, I notified Jacob May that, as it was a nice day, we would go over there now. So we went over. We went across the farms, and not around the pike—through Dick Haldeman's place—that way. Mr. Drawbaugh had one clock done, and was making another one for a party in Harrisburg—so he told us—who was to give him three hundred dollars for it. The party had engaged it for three hundred dollars. We thought it was a very nice piece of machinery.

Q. 42. Was there anybody, besides Drawbaugh, working in the shop at the time?

A. Yes, sir. He had a young man there doing the mahogany work, finishing it, and making up the casing that belongs to clocks.

Q. 43. Did you know the name of the young man?

A. No, sir, but I think he was a relation of Drawbaugh. I can't say positively, as I had no introduction to him ?

Q. 44. Were you ever there at Mr. Drawbaugh's shop after that visit in 1877 ?

A. No, sir.

Q. 45. How confident are you that the year in which you were there last, was 1877, as you have testified ?

A. I quit Col. McCormick's employ in the month of September, 1877, and went out to Kansas with a colony in the April following.

Q. 46. Have you been employed at Fairview since ?

A. No, sir.

Q. 47. When you were at Drawbaugh's shop in 1877, as you have testified, did you see any talking machines there ?

A. Yes, sir.

Q. 48. How many, and where were they ?

A. That would be hard for me tell you, for they were so numerous. On the benches, and on the wall, some five or six feet up—stuck up.

Q. 49. Did you at that time talk through the machines, or hear anybody talk through them ?

A. No, sir.

Q. 50. You have described four visits, which you made to Mr. Drawbaugh's shop. Do you think these were all the visits that you ever made there, or not ?

A. Yes, sir.

Q. 51. During any of these visits, did Mr. Drawbaugh say any thing about patenting the talking-machine ?

A. Yes, sir. The second time I was there, he said he was a poor man like myself, and if he only had the money, he would get everything patented that he had ever made.

Q. 52. Did he mention the subject afterwards, in any of your later visits ?

A. Yes, sir. Always plead poverty; that he always had to work for a living.

Q. 53. Will you please examine the machines now here present, and state whether you can identify any of them as machines which you saw on the occasion of your first visit in the fall of 1873 ?

A. These are the ones I saw, [*indicating "B" and "F."*]

Q. 54. See if you can identify any of the machines as ones that you saw at your visit in August, 1874.

A. That visit was in the middle or latter part of August, 1874. I saw this, ("*D*")—this in particular, [*witness puts his finger on the curled magnet.*] I asked him whether this caused the vibration.

Q. 55. Look at the instruments and see whether you find the one which you put your mouth to during the second visit, when Mr. Drawbaugh told you to put your ear instead of your mouth?

A. It looked something like that, [*taking up* "*A*,"] but it didn't look quite as big as that. I can hardly pick that out.

Q. 56. Please look at the instruments, and see whether you identify any of them as instruments that you saw at the time of your third visit, in August, 1875?

A. These I seen sitting on the counter. [*indicating "C" and "C" reproduced.*]

Q. 57. Look at the instruments again, and see if you recognize any that you saw at the time of your last visit, in 1877.

A. The one with the bell on it, ("*H*;") it was fastened up against the wall, about six feet up.

Q. 58. Did you talk through the machine, or hear anybody talk through it, at the time of your first visit, in the fall of 1873?

A. No. I was there by myself, with Mr. Drawbaugh. He didn't talk through it.

Q. 59. Then you heard talking through the instruments only on two visits?

A. Only on two visits. Yes, sir.

Q. 60. Those visits were, the one about August, 1874, and the other about August, 1875?

Y. Yes, sir.

Q. 61. The conversation which occurred, in which you asked him whether this was the vibrating part, was a conversation that occurred during one of the visits when the instruments were talked through, if I understand you?

A. Yes, sir.

Q. 62. And do you think you can positively identify this instrument "D," as the one which you had in your hand when you asked him whether this was the part that made the vibrations?

A. I couldn't positively identify this [*pointing to the body of the instrument,*] but this is the part [*pointing to the curled permanent magnet,*] that I asked him whether it made the vibrations.

Q. 63. Are you certain whether that conversation about that being the part that made the vibrations, took place at the second visit, to wit, the one in August, 1874?

[*Objected to on the ground that the witness has already testified about it.*]

A. Yes, sir. It was in 1874 that I asked him about this—this circle [*putting his finger on the curled magnet of "D"*]. It didn't look quite as big as this.

Q. 64. Did you see that instrument again, when you were there with Mr. Kline, in August, 1875?

A. Yes, sir. I saw it lying on the bench with others.

Q. 65. At all the visits, when you were there, were the instruments lying open, exposed to the view of any person who might come into the shop?

A. Yes, sir. Anybody could see them.

Q. 66. How many talking machines, or instruments, do you think you saw there at the time of your second visit. I mean the visit of 1874?

A. They were numerous there. I couldn't exactly give the number. Some were finished and some half finished. They were setting around there on benches and on shelves. I suppose, if they were all talking machines, there were a good many.

Q. 67. Do you know whether they were all talking machines, that you have referred to as sitting around on the shelves?

A. No, sir. I don't know whether they were all talking machines.

Q. 68. My question referred only to talking machines. I asked how many talking machines you thought you saw around there, at the time of your second visit?

A. I think there were six or seven, anyhow, to the best of my knowledge.

Q. 69. Do you think you saw as many as that, at the time of your third visit?

A. Oh, yes, sir.

Q. 70 Do you think you saw more at the time of your third visit, than you did at the time of your second visit?

A. Yes, sir. Every time I went there, there was more there than there was before.

Q. 71. Do any of these instruments here present, look like the one you had in your hand at the time when Mr. Kline was there, when you asked whether you could talk back through the instruments?

A. There are so many of them here that it would be hard to pick them out.

Q. 72. I asked you whether any of them looked like the one. Not to identify them positively.

A. Yes, sir. Several of them look like it—something like that, [*taking up* "*E.*"]

Q. 73. At the time of your first visit, did you see any talking machines, except the glass tumbler and the tin box?

A, None that I thought were talking machines. I saw models, but I didn't ask what they were.

Q. 74. At the time of your third conversation, when Mr. Kline was there with you, what explanation, if any, did Mr. Drawbaugh give you as to the operation of the talking machine—how it worked—whether by electricity, or otherwise?

A. He didn't give me none then.

Q. 75. Do you remember whether you asked him any questions about the construction, or principle of the machine, then?

A. No, sir. I didn't ask him no questions. I was talking to Mr. Kline.

Q. 76. Do you remember whether anything was said at that third visit about what caused the vibrations?

A. No, sir; nothing said to me, then, about the vibrations. Mr. Kline was talking to me, telling its value.

Cross-examination waived by Mr. Storrow.

Examination taken, reduced to writing, and by the witnes affirmed to, and for him subscribed to by me, he having been disabled by a wound received during the Rebellion, in the service of the United States.

Fred. M. Ott,
Examiner.

Examination resumed pursuant to adjournment.

Present same counsel.

ABRAHAM FISHER, *being recalled, saith:*

Examined by Mr. Hill:

Q. 1. You testified, in your former deposition, that you got a hydraulic ram from Mr. Drawbaugh in the latter part of May, 1874, which date you verified by looking at some books or memoranda made at the time. I refer to your testimony printed on page 718 [689] of Defendants' printed record. Subsequently to your testifying, as above stated, Mr. Daniel Drawbaugh was examined as a witness, and testified (on page — of Defendants's printed record) that, according to his memoranda, your purchase of said ram was in June, 1873. Please state whether your attention has been called to the discrepancy between your date and Mr. Drawbaugh's, and whether you have made further investigation to fix the correct date, and with what result?

A. I have. I received a letter from Mr. Storrow here, in regard to my evidence, that, in my testimony in the Drawbaugh case, I had stated that I had bought a ram of Mr. Drawbaugh in 1874, which I had verified by a bill, or books, I don't know which. I think that implies about what he wrote, as near as I can recollect. I replied to him without investigating, saying that I had no bill of the ram. I then went to Petersburg in the evening. I met Mr. Snyder there, who helped to put in the pipes of the ram. I asked him if he knew the date of the year, and the month, it was put in. He studied awhile, and I says, "I had the Jacobs family with me, which I was governed by." "Yes," he says, "That is right. Jacobs helped to dig the ditch." Then I said, "That was in 1874. I have it in my book." He just says then, "Well, you must be right, but when I go home I will look at my memorandum books and see if I can find anything." Then I received a second letter from Mr. Storrow, containing a copy of that part of my testimony, and asking for a copy of the memorandum that I referred to in that part of my testimony. I stated to him that I had spoke to Mr. Snyder and Ziegler, and three or fuor around me, and when I referred to the Jacobs family, they allowed that I must be right. That is what I wrote, as near as I can recollect. That is about as far as I went, that time. Then they got to talking over these things, and going back on their rents. They said they were wrong for all. Snyder said he knew, from the fact that he quarried stone for a mill-dam for Abraham Smith, in 1874, and he knows the ram was put in the year before. And his brother also said that he knew it was in 1873 that the ram was put in. William Snyder also said that he knew the fact from the different places that he had rented from year to year, which his brother would verify. This bothered me a good deal then, and my wife says to me, "What are you hunting for?" I was hunting up the memorandums of the help that was about the house. I kept no accounts, except when they would get something ahead, or in advance. "Why," she says, "you needn't be bothered about that. You know the Jacobs family was here two years. Don't you remember the times that they had at the wash-house about the rams?" This brought it all to my mind. It was a wettish season, and at every shower the ram throwed sediment up into the vessels. I took it out then, and I made Jacobs and my help carry the wash-water in a large vessel that I had in the wash-house, from the spring, if the creek was muddy, or from the pump, sometimes. I had several wash-women and ironing-women, I don't know how many, and these women nick-named this help by calling them "rams," you know, and it got to be a by-word among the help, and at last they got mad about it. I remember the circumstance very well. When I testified before, I went by the memorandum in this book [*producing an account book.*] I forgot at the time that I had the Jacobs family with me more than one year, and was misled by the entry showing charges against them in 1874.

[*The entry referred to by the witness is contained in an account book produced by him, and is as follows:*

"YORK SULPHUR SPRINGS, May 1st, 1874.

June 22,	Mrs. Adaline Jacobs,	Dr. to cash,	2.50
27,	Mrs. Adaline Jacobs,	to 1 pt. wine,	.50
27,	Mrs. Adaline Jacobs,	Dr. to cash,	.25
July 1st,	" "	" By cash for Day,	3.00
			6.25"

[*Written across the face of the above entry is the word "down," which witness says refers to the fact that these items were posted in a little passbook, and that he kept separate accounts with each servant in such passbooks.*]

Q. 2. Does your book contain any charges against the Jacobs family in 1873?

A. No, sir.

Q. 3. Why not?

A. Because I paid them off every Saturday night, and gave them none in advance.

Q. 4. Then you only charged on the books the advances you made to them, I suppose. Is that the idea?

A. Yes, sir; that is the idea.

Q. 5. Now, with your memory refreshed, as you have stated, in what year do you think it was that you got the ram from Mr. Drawbaugh?

A. In the year 1873, because I knew that Jacobs and his daughter, and his wife also, was with me that season. That is what throwed me wrong in not thinking that I had them two seasons; and I recollect, also, that I didn't have Jacobs himself regularly in 1874. I had him sometimes, but not all season. I find charges against the women, but none against him that year. This ram business has brought everything to me clearly, and I recollect it now very well.

Cross-examination waived by Mr. Storrow.

Examination taken, reduced to writing, and by the witness subscribed to before me this first day of March, 1882, he having been affirmed when previously called as a witness.

FRED. M. OTT,
Examiner.

ABRAHAM FISHER.

Adjourned until March 2d, 1882, at twelve, M.

March 2, 1882, 12 o'clock, M.

Examination resumed pursuant to adjournment.

Present same counsel.

THOMAS DRAPER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

My age is sixty-six; residence, Dover, Delaware; occupation, manufacturer of phosphate, and dealer in grain, lime, and wood. I have a general transportation agency. I have a line of vessels running from Philadelphia to Dover. I know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna. I have no particular acquaintance with him. I have known him since some time in the spring or summer of 1874.

Q. 1. State how you came to make his acquaintance in the spring or summer of 1874.

A. I was induced to go there with a tenant of mine, who lived on a farm of mine in Pennsylvania, to see Mr. Drawbaugh about putting in a ram to throw water from a spring we had up to a new stone house that I had built on the hill.

Q. 2. What was the name of that tenant?

A. George Kissinger, or George W. Kissinger. He was an acquaintance of Drawbaugh's, and introduced me to him.

Q. 3. How do you fix the time as in the year 1874?

A. Mr. Kissinger moved on to my farm the first of April, 1874, under a lease of that date.

Q. 4. Have you that lease here present?

A. I have.

Q. 5. Please produce it, in order that the examiner may certify the date of it upon the record.

A. Here it is.

[*The lease produced bears the date of the first day of April,* 1874, *and is signed by Thomas Draper and Geo. Kissinger.*]

Q. 6. How long after that lease was made do you think it was before you made the acquaintance of Mr. Drawbaugh, in the manner you have stated?

A. I couldn't say positively, but I think it must have been in the early part of the summer, or it may have been in May, possibly. I couldn't state positively. I know it was shortly after Mr. Kissinger moved on the place. He complained that his wife had to carry water too far, and he wanted me to put in a ram.

[*A copy of said lease, certified by the examiner, is put in evidence, and hereto appended, and is marked "Exhibit Draper-Kissinger Lease."*]

Q. 7. Are you confident that it was in the same spring or summer?

A. Yes, sir. I am sure of that.

Q. 8. Did you arrange with Mr. Drawbaugh to furnish a ram for your farm?

A. Yes, sir.

Q. 9. Do you know when that ram was put on to the farm?

A. I do not, but I don't think it was put on until 1875. The arrangement was made that Kissinger was to cut down sapling and bore out the piping until he had enough to reach from the spring to the house. He had a trouble in getting an augur to bore the piping, but at last succeeded in getting one, and made the piping. Then the ram was put in by Drawbaugh, but I was not present when it was put in, and do not know exactly when it was done.

Q. 10. When you made Mr. Drawbaugh's acquaintance did you visit his shop with Mr. Kissinger?

A. I did.

Q. 11. Were you ever there at any other time before or since that visit?

A. No, sir.

Q. 12. While you were there on that visit to Drawbaugh's shop, did you obtain any knowledge of his talking machines. If so, how did it come about?

A. Yes. Mr. Kissinger asked Mr. Drawbaugh how he was getting along with his talking machines. Mr. Drawbaugh replied that he had it nearly completed, or something of that kind. I don't exactly remember the expression, and that he was getting along pretty well. He said what he lacked was money, or means. I don't recollect precisely the expression, but what he said was that he lacked money or means to put it through.

Q. 13. Did he say anything about patenting it. If so, what?

A. I think he did. He said he lacked money to get a patent. He intended to get it patented, but hadn't the money, and Kissinger said; "You had better get Draper enlisted in it; he has plenty of money." If those were not the precise words, it was something to that effect. I think they are the precise words.

Q. 14. Did, or did not, Mr. Drawbaugh then signify his desire to have you take an interest with him, and furnish the money?

A. I don't recollect the precise words that he said, but he invited us into the shop or place where he had his talking machines, and intimated that he would like me to take an interest in it. I don't remember the precise expression, but he took the pains to show me his instruments, and gave me to understand that he wanted me to go in with him. I declined; I told him that I was too far away, as I was in business in Delaware, and I did not care to invest in it, although I thought it was a good thing and might turn out well.

Q. 15. Do you remember whether he said anything about what he thought the value of it, and if so, what he said?

A. He said he thought it was, or would be, one of the greatest inventions of the age, and would take the place of telegraphing. I think those were as near his words as I can recollect—about the expression.

Q. 16. Did he state whether he had used the talking machine outside of his shop, or not?

[*Objected to as secondary and hearsay, and otherwise unimportant.*]

A. I think he said he had not used it out. He said he was convinced he could.

Q. 17. Do you remember whether he gave any reason for not having used it outside of his shop, and if so, what that reason was?

[*Same objection.*]

A. I don't recollect his words on that occasion. He intimated that he was keeping it kind of secret, but I don't recollect his words. I know what he said he could do, but I don't know what his reasons were for it, only as I gather it from his talk.

Q. 18. What did you gather from his talk, that his reasons were for keeping it kind of secret?

[*Same objection.*]

A. I thought from what he said that he didn't want anybody to know. He said he thought that by the same current of air he could talk across the street. I don't think he told me what his reasons for keeping secret were. The idea that I gathered was that he intended to get a patent on it, and was keeping it secret for that purpose. I don't know that he said so to me, but that was the idea I got of it.

Q. 19. When he took you in to show you his talking machines, did he talk to you through them or not?

A. He did.

Q. 20. When he was talking, and you listening through the machines, were you in different rooms, or was he in the same room with you?

A. We were in different rooms—adjoining rooms.

Q. 21. Were you so situated that you could hear what he said, except through the machine or not?

A. I could not have heard. There was a door between the two rooms, but he closed the door. He and Kissinger were in one room, and I went into the other.

Q. 22. Did you actually hear and understand through the machine what he was saying in the other room?

A. I did, though his voice seemed to be very much changed—a fairy voice—kind of a feminine voice—something like a whisper. I could understand distinctly every word that he said, but I could not have told that it was the same person talking.

Q. 23. Have you ever, since that time, listened at one of these electric telephones that are used now in towns and cities, and heard the words that came over the telephone line?

A. I have, but never but twice that I recollect of.

Q. 24. When and where was that?

A. In the city of Philadelphia here. Once in Holmes & Brazer's office, and once in Baugh & Son's office. It has been within a year or two. I think, perhaps, it was within the last season. I think Mr. Barnet, in Baugh's office, asked me if I had ever heard a telephone, and invited me in to listen. I told him I supposed I had heard one before ever he did, and I told him about Drawbaugh's invention. I supposed it was the same thing. I supposed Drawbaugh had got somebody in with him, and I never knowed any better until this man came down to Dover. I never inquired anything about it.

Q. 25. When you listened at the telephone here in Philadelphia, how did the voice which you heard through the instrument compare with the voice you heard through Mr. Drawbaugh's instrument, at your visit to his shop, and which you described as having a fairy-character or sound in it?

A. It appeared to me to be precisely the same. I thought it was the same thing.

Q. 26. Will you please examine the talking-machine instruments here present, and see if you can identify any of them as the instruments which you saw at Mr. Drawbaugh's shop?

A. I recollect this thing here [*indicating* "*C reproduced*"]. These two are pretty much alike [*pointing to* "*C*" *and* "*C reproduced*"], and I couldn't tell which one it was, but I recollect this very distinctly [*pointing to the permanent magnet on* "*C reproduced*"]. It seemes to me that it was something like that [*indicating* "*I*"] that I had in the room where I was when I listened [*witness takes up* "*I*" *and puts it to his ear*]. I held it up to my ear this way when I listened. I think that is the very box. I couldn't say positively, but it was one like that. He talked to me more freely about that permanent magnet [*indicating* "*C reproduced*"], and explained to me about the positive and negative poles of it, and how to charge it. He charged my knife with it. He drew it over the knife in one way and charged it, and then he drew it over the other way and took the magnetism off. He put it on and took it off several times, and then I told him to leave it on, that I wanted to take it home that way. I don't know that I recollect any of the other instruments. He had so many instruments and things lying around there on the bench that I can't recollect, but I am pretty positive that these two [*indicating* "*C reproduced*" *and* "*I*"] are the very ones, or just like the ones. I recollect that he had a glass tumbler somewhere about the machinery, lined with something white—plaster-of-paris, or something of that kind. I don't know what position he had it in, nor how he marked it; neither do I know how he marked the other instruments. I done the listening and he done the talking. I only know that that is the thing [*indicating* "*I*"] that I listened at, or something like that.

Q. 27. When he talked through the machine in the other room, was it the machine like this [" *C reproduced*,"] that he used ?

A. I couldn't see it when I was in the other room, but when I came back he showed it to me, and told me that was what he used. I think there was a wire connected to it in some way. I think the wire ran through a hole in the wall.

Q. 28. Did you understand at the time that the machine worked by means of electricity, or not ?

A. Yes, sir. He tried to explain that thing to me.

Q. 29. When he magnetized and de-magnetized your knife, did he use the magnet that was on the talking machine for the purpose ?

A. He did.

Q. 30. Did he take the magnet off of the talking machine to magnetize your knife ?

A. He did. He took the thing to pieces when we left. He only took the magnet off and hung it up on a peg over his bench.

Q. 31. You mean by his taking it to pieces that he took the magnet off and hung it up ?

A. Yes, sir.

Q. 32. When you were first taken into the shop to see the talking machines, where were the talking machines ?

A. I think the magnet was on the same pin that he hung it on when we came away. I think the other machines were in their places on the bench. I inferred from his whole demeanor there, that he was anxious to get me to take hold of it with him. That is what I inferred.

Q. 33. In your 24th answer you say, in substance, that when you heard the speaking telephone here in Philadelphia, you supposed that it was the same thing which you had seen at Drawbaugh's shop, and supposed that Drawbaugh had got somebody in with him, and never knew any better "until this man came down to Dover." Until what man came to Dover? Please explain what circumstance you refer to?

A. I don't remember his name. He said he was a lawyer employed by the Bell Telephone Company. I think he said he was from Boston, but I may be mistaken in that. I don't know whether he said he was from Boston or New York, but I most think he said he was from Boston.

Q. 34. About how long ago did he call upon you at Dover?

A. I think it was in the latter part of January, 1882, or the beginning of February.

Q. 35. Did he tell you that he came to see you about anything. If so, what?

A. He said he wanted a few minutes private conversation with me. There were one or two persons in my office, and they stepped into the other room. He then desired to know what I knew about invention of the telephone. I asked him what he wanted—what he meant by it? and then he told me that there was a law-suit pending, but didn't tell me who, or why, or anything about it, except that he wanted to know what I knew about the invention. I refused to tell him for some time. I told him I didn't want to be called away as a witness anywhere. I asked him, then, how he found out that I knew anything about it? He told me that a man by the name of Miller had told it in Wise's store in Marysville; that he (Miller) had heard me say that I had been over to Drawbaugh's shop, and had seen his talking machine. Miller was a man who worked for me. He carried the chain for me when I laid out the borough of Marysville, and he was well acquainted with me.

Recess for dinner until 3:30, P. M.

March 2d, 1882, 3:30, P. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Examination of Thomas Draper by Mr. Hill continued:

Q. 36. What further conversation did you have with this gentleman during his call at Dover?

A. He told me that it was not likely that I would be called away anywhere. That if my evidence was of any use to them, it would be taken there at Dover, by a commission for that purpose. At that time I didn't know anything about what was going on, nor had he told me which side he was on. After he said it was not likely that I would be taken away, I told him, as near as I can recollect, just what I have told you gentlemen. That I had been over to Drawbaugh's shop and had seen the instruments. I think I told him that I didn't know whether it was in 1874 or 1873, but that I thought it was in 1873. He asked me if I was sure it was prior to 1876, that I was there. I told him I knew it was that; that I knew it wasn't later than 1875, but that I thought it was in 1873 or 1874. Then he asked me whether I had no papers, bills or memoranda of any kind from which I could fix the date; and I told him that I didn't know whether I had or not, that I might have. I told him that if I were to institute a search among my old papers, it was likely I might find something, but that I didn't know that I could. I didn't make any search while he was there. He only stayed an hour, or an hour and a half. Then he asked me about Drawbaugh's instruments—what sort of instruments he had, and I described them to him as nearly as I could. He asked me a great many questions about them. After I had answered them all as best I could, he said it was a very singular thing that two men in different parts of the country should fall upon the same, or hit upon the same kind of instruments. Then I told him I thought it was all one and the same thing. That I had always thought it was Drawbaugh's patent. That I had heard of the Bell telephone, but thought he had got Bell in. That was the idea I had of it. He went on and told me different. He then went on and told me that he was an attorney for the Bell company, and told me about the law-suit. And he told me I had missed a big fortune. He said, "You wouldn't need to be here manufacturing phosphate if you had just taken hold of that thing with Drawbaugh." That is about the conversation we had. He said I needn't be uneasy about being called away as a witness, as they would not need me. Said he, "We shall not need you." He said if the other party didn't need me, they should not. "If the other party don't call you away, we shan't, certain."

Q. 37. Do you know how the "other party" came to know about your information, and to call you as a witness?

A. I wrote to Mr. Drawbaugh and stated to him that this gentleman had been there. Told him that I had given him the information that I got, and stated that I thought, while I was doing so, that he was his attorney, and that it was his patent; that that was the impression I was under when I gave him the information. That was the way he got to hear of it. I wrote to him. I think if I am not mistaken that I wrote to him about the visit that Kissinger and I had made to his place.

Q. 38. Please look at the letter which I now hand you, and state in whose handwriting it is, and whether it is the letter you wrote to Mr. Drawbaugh, as stated in your answer above?

A. This is the letter I wrote.

Q. 39. Did you send the letter to Mr. Drawbaugh through the mail?

A. I presume I did. I sent it to him somehow. I had no other way to send it but through the mail. I see this letter is dated January 30th. I supposed it was about the latter part of January, but I had forgotten the date.

[*Mr. Hill puts the letter in evidence, to be marked* "*Exhibit Draper letter,*" *and by consent a copy is substituted for the original, the original to be produced when called for.*]

Q. 40. I see that the letter refers to the conversation between you and the attorney of the Bell Telephone Company and I find, among other things, the following in it; "I told him I did want to be called up as a witness," the first five words, ending with "did," being at the bottom of page 1, and the rest being at top of page 2. Why did you tell him that?

A. I didn't mean that I told him that. I intended to tell him that I was too old to go away from home, and did not want to be called as a witness. It was a mistake I must have made in writing, if it reads that way. I told him repeatedly, before I knew what side he was on, that I did not want to be taken away from home. I cannot ride in the cars, or even in a carriage, without suffering from it, on account of neuralgia in the spine, that I contracted in the army.

Q. 41. Please look at the envelope which I now show you, and state whether the superscription is in your handwriting, and whether that is the envelope in which you sent the letter referred to, to Mr. Drawbaugh.

A. Yes, sir; that is my handwriting. The date corresponds with the letter; that is, the envelope in which the letter was sent.

[*Mr. Hill puts said envelope in evidence, to be marked "Exhibit Draper envelope." By consent, a copy of said envelope is put in evidence, the original to be produced when called for.*]

Q. 42. After you had sent that letter to Mr. Drawbaugh, did you have a visit from him with reference to the matter?

A. Yes, sir; I didn't hear anything from him until he came down to Dover in company with Mr. Jacobs. I think it was about a week or ten days after that. I didn't take any account of the time, but I know it was some days.

Q. 43. Was that the first time you had seen Mr. Drawbaugh since your visit to his shop in 1874?

A. Yes, sir.

Q. 44. I notice that in the letter you speak of having made the visit to his shop in 1873 or 1874, and you now fix the time positively as in 1874. When did you investigate the matter, so as to fix the time correctly?

A. The next day after Mr. Drawbaugh was down to see me at Dover. I told him I would take a ride down to the farm, which was about eight miles from Dover, where I had been living most of the time since I was at his shop in 1874, and make a search among my old papers to see if I could find any dates. There I found the lease between Kissinger and myself, bearing date April 1st, 1884. That is the way I arrived positively at the date.

Q. 45. You spoke of having been in the army during the war. In what regiment were you and in what capacity did you serve?

A. I was in the 3d Regiment Delaware Volunteers—militia. I went out as captain of company H.

Cross-examined by Mr. Storrow:

Cross-Q. 46. At the time of your visit to Mr. Drawbaugh's shop, which you have described, where were the three talking machines which you have identified?

A. I think they were on a long bench that was at one end of his shop. The horse-shoe magnet, if I am not mistaken, was hanging on a pin or nail over the bench.

Cross-Q. 47. Did you see any other talking machines in the room at the time?

A. I only saw those three, after he put them together, that I have described, that he used. There was a number of other small matters lying there on the bench. He had a glass tumbler connected with the machine in some way. It was coated with a white substance, that I think he told me was plaster-of-paris.

Cross-Q. 48. Did you understand that any of these other small matters were talking machines, or that the three you have pointed out were the only ones he had?

A. They were the only ones that he mentioned to me. He said he had been working on it for several years, but whether these other little matters or models were talking machines or not, I don't know. He didn't state anything to me about it.

Cross-Q. 49. I understand you to say that the visit to Drawbaugh's shop, you have testified about, was for the purpose of ordering a ram, but that it was the following season when the ram was actually delivered and put up. Is that your meaning?

A. So far as my visit to Drawbaugh's shop is concerned, that is correct; but I am not certain that I said positively that the ram was not put in until the next season. I am not certain about that, but I am of the opinion that it was not put in until the next season. I know that there was considerable delay about getting the wooden piping bored, and I wrote to him several times about it, but Kissinger didn't get it in until sometime in the following season. I was anxious to see how the ram would work. Kissinger's excuse to me was, that he couldn't get an augur to bore the pipes with. I think it was some time late in the season. I think it was in the fall of 1875, sometime, when he put the ram in. That is my impression.

Cross-Q. 50. In your 34th answer, you say that the gentleman came to call on you at Dover, in the latter part of January, 1882, or in the beginning of February. Can you now tell which it was?

A. I could only fix the date by my letter to Mr. Drawbaugh positively. I know I wrote very soon after he was there. The letter is dated January 30th. That would fix the time in January. I kept no account of the time, and no copy of the letter that I wrote.

Cross-Q. 51. Had not some of your acquaintances talked with you about Drawbaugh's talking machines, within a month or two before that visit?

A. Not to my recollection.

Cross-Q. 52. Do you remember when you last had any talk about it with anybody, before that?

A. It seems to me that there was something said in Marysville, when I was up at Christmas, or near Christmas, in Eppler's shop. But I don't remember now what the conversation was. I think we were talking about the ram, and some one mentioned that it was out of order. And I think I asked Eppler what had become of Drawbaugh's talking machine—what he had done with it, but I don't recollect the reply, if any was made. I recollect that I told Eppler about having been at Drawbaugh's shop and having seen the talking machine. It was some time since this last Christmas that I was up there, but I don't remember the time exactly. They said that the ram was out of order, and I asked then, if he couldn't get Drawbaugh to come over and put the ram in order.

Cross-Q. 53. Do you still own the farm that the ram is on?

A. I hardly know how to answer that question. I have sold it since, but the deeds are not executed. I have traded it away with I. Engle Cochran, of Chester, Pennsylvania, for some Chester property, but the deeds have not been executed on either side.

Cross-Q. 54. When was that trade made?

A. I can't answer that date. We commenced talking about the trade some time in January of this year.

Re-direct by Mr. Hill:

Q. Q. 55. Was the ram, that was mentioned at Eppler's store, the same ram that was purchased from Drawbaugh and put on to your farm?

A. Yes, the same ram. The tenant on the farm told me that the ram was out of order, and Eppler was my agent over there, and I asked him whether Drawbaugh couldn't be got over to put it in order, and then this conversation took place, as I have stated. I had supposed that his talking machine was the same machine that was in operation. I had not made any particular inquiry about it.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 2nd day of March, 1882.
FRED. M. OTT,
Examiner.

THOMAS DRAPER.

GEORGE W. HEIGES *being produced, affirmed and examined, saith:*

Examined by Mr. Hill:

My age is forty-three; residence, Eberly's Mills, Cumberland county, Penna.; occupation, machinist.

Q. 1. Where and by whom have you been employed for the month or two last past?

A. I have been employed by Mr. E. W. Chellis, at the machine works, at Eberly's Mills.

Q. 2. By the machine works, do you mean the old shop that has been occupied a good many years by Daniel Drawbaugh?

A. Yes, sir.

Q. 3. Do you know this gentleman who sits by my side, Mr. Park Benjamin?

A. Yes, sir. I have had some little acquaintance with him, of late.

Q. 4. Were you present at said shop at Eberly's Mills within the past month, when Mr. Park Benjamin was testing some telephones there?

A. Yes, sir. I was there when Mr. Benjamin was testing the instruments—different machines.

Q. 5. Did Mr. Benjamin call upon you while he was making those tests to assist him by watching the instruments during his absence, in order to be sure that no change of instruments was made, except by himself?

A. Yes, sir.

Q. 6. How was the matter managed by Mr. Benjamin and you to guard against any change of the instruments while he was out of the shop?

A. Mr. Benjamin would fasten the instrument on the line—connect it—and I was asked by Mr. Benjamin to be present to see that nothing was disturbed at that instrument while he was away, and that it was left the same as he had put it.

Q. 7. Did you do as he requested you?

A. Yes, sir.

Q. 8. In each case, when Mr. Benjamin attached an instrument to the line and left you to watch it till he came back, in any and all of those tests, please state whether the instrument was changed while Mr. Benjamin was away from your presence, or whether the same instruments continued to remain attached until Mr. Benjamin's return?

A. The same instruments remained attached as Mr. Benjamin had put them.

Q. 9. And were Mr. Benjamin's directions to you complied with in all respects?

A. Yes, sir.

Q. 10. In some of those tests, did or did not Mr. Benjamin attach certain instruments to the line inside of the building, and directly in front of a glass window, through which he could see the instruments, while he operated at the other end of the line, outside of the shop?

A. Yes, sir; he did.

Q. 11. Then, when Mr. Benjamin affixed an instrument to the line in the shop, and went outside of the shop to the other end of the line to test it, and left you to watch the instrument in the shop, in every case the test was made with the identical instrument which he affixed to the line before he went out. Is that the fact or not?

A. It is.

Cross-examined by Mr. Storrow:

Cross-Q. 12. How long have you been employed in that shop?

A. Since the third of November, 1880, I have been employed there.

Cross-Q. 13. Where did you live before that?

A. I had my family in Franklintown, York county.

Cross-Q. 14. Where did you work then?

A. At Churchtown, Cumberland county.

Cross-Q. 15. You have described the manner in which you watched various instruments for Mr. Benjamin. What were the instruments you watched?

A. Telephone instruments.

Cross-Q. 16. Were they instruments which have been used in this case or put in evidence?

A. I can only answer that by hearsay.

Cross-Q. 17. Please answer it by hearsay.

A. Mr. Drawbaugh told me that they were the instruments that belong over here. That has been reported to me, maybe, three or four times.

Cross-Q. 18. Did they have attached to them tags, bearing the signature of Mr. Ott, the examiner?

A. Yes, sir.

Cross-Q. 19. The tag attached to each instrument had a letter on it to designate it, didn't it?

A. Yes, sir.

Cross-Q. 20. Please to tell me, by letters or otherwise, which are the instruments which you watched, as you have described?

A. "I" was one of them; "A" was one of them; "D" was one of them; "E" was one of them; "C" was one of them; "O" was one of them; "G" was one of them; "L" was one of them; "M" was one of them; "P" was one of them. That is all I have down. That is all I could say at present.

Cross-Q. 21. Did you watch any others than those you have just mentioned, and if so, which are they?

A. We tried "H" and "N." I can't remember of trying "J" or "Q." I don't remember of trying "F" or "B." We tried a reproduced tumbler instrument "F," and also a reproduced tin-can instrument "B."

Cross-Q. 22. How long have you known Mr. Chellis?

A. The first time I met Mr. Chellis was the week before I commenced to work, which was the week before the third of November, 1880. Since that I have known him.

Cross-Q. 23. How long have you known Mr. Daniel Drawbaugh?

A. I can't tell that time exactly. It is about three years.

Re-direct by Mr. Hill:

Q. Q. 24. Do you know whether the instruments "C," "P," "L," "M," and "O," which were tried in your presence, were original or reproduced instruments?

A. I wouldn't be able to tell whether the instruments named were the original or reproduced instruments, for the reason that I am not well enough acquainted with them. My attention has not been upon this work at all. I can say very little about that.

Q. Q. 25. Was your attention particularly directed to anything, except that when Mr. Benjamin attached an instrument to the line and went out of the shop, that instrument should not be detached or changed till he directed it to be done on his return?

A. I can't recollect at present of anything, just at this time, besides the attachment of the machines.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 23d day of December, A. D. 1881.
Fred. M. Ott,
Examiner.

George W. Heiges.

[*The examination of Daniel Drawbaugh was temporarily suspended in order to take the foregoing deposition, and resumed at its close, Dec.* 23, 1881. FRED. M. OTT, *Examiner.*]

Adjourned to meet at the office of Park Benjamin, Esq., No. 234 Broadway, New York city, New York, at 10:30 A. M., on Saturday, March 4, 1882.

March 4, 1882, 11 A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for Complainants, and Mr. Hill for Respondents.

PARK BENJAMIN *being produced, sworn, and examined, saith:*

Examined by Mr. Hill.

Q. 1. State your age, residence and occupation?

A. Age, thirty-three; residence, New York City; occupation, Mechanical Engineer.

Q. 2. What opportunities have you had for becoming acquainted with mechanical science, and the mechanical arts, including electricity and its practical application in the arts, and more particularly referring to the electric speaking telephone, and various discoveries, inventions and publications, having relation thereto?

A. I am a graduate of the United States Naval Academy, and have devoted myself to the study of mechanical science and engineering, as a profession, for upwards of twelve years last past. I was for six years associate editor of the *Scientific American*, between 1872 and 1878, and I am the editor of *Appleton's Encyclopedia of Applied Mechanics.* For more than three years last past I have practiced as a Mechanical Engineer, and solicitor of patents, and I have repeatedly been called to testify as an expert in patent cases in United States courts, in this and other circuits. I have been familiar with the principles of electrical science during my professional life, and, more especially, with electric telephones, from 1870. During this interval I have kept myself posted on the progress of invention in telephones, so far as the same has been made public, and I consider myself reasonably familiar with the principles on which the apparatus is based, and with its various forms.

Q. 3. When did you first hear of the term "Telephone," and in what connection?

A. As I have stated, I think in 1870. I was then editorially connected with the *Manufacturer and Builder*, a scientific magazine still published in this city. In the issue of that journal of May, 1869, appeared an illustrated article on the Reis telephone. From that article I first became acquainted with the name and the construction of the instrument described. Subsequently, and I think in 1870, I saw a Reis telephone made or obtained by Dr. Van der Weyde, who was also connected with the *Manufacturer and Builder* at the time, and from that instrument obtained a more practical knowledge of its construction and operation.

Q. 4. What were your duties in connection with the *Scientific American*, while you were editorially connected with that journal, from 1872 to 1878, as you have testified ?

A. I was an associate editor, and was the only person regularly and continuously employed to perform editorial labor in the office of that journal, assisting the proprietors. I went from the *Manufacturer and Builder* to the *Scientific American*, in July, 1872. There were, of course, outside contributors and proof-readers employed. I wrote the majority, I think, of the leading editorials which appeared in that paper during the period mentioned, and with few exceptions, all the descriptions of new inventions that were illustrated, besides performing ordinary editorial work in selecting, arranging, and re-writing matter.

Q. 5. When employed as stated in your last answer, what opportunities did you have for learning of the production of new inventions, and for making yourself familiar with them ?

A. I suppose my opportunities in that respect were exceptional. It was obviously my duty to become acquainted with whatever was new in science, so as to be prepared to explain or discuss it in the paper. I was constantly in receipt of early information from inventors and investigators as to their discoveries, this information being often personally given to me by the parties themselves. I had other sources of information, such as most editors have, in correspondents' letters, exchange newspapers, &c. I was in the habit of reviewing the new scentific books and periodicals as they appeared, and of preparing weekly, large numbers of abstracts of newly issued patents for publication in the *Scientific American.*

Q. 6. What position did that journal occupy among the scientific periodicals of the country, and what was its circulation during the time that you were connected with it ?

A. I believe it was generally then, and still is, regarded as the leading publication of its class in the United States. So far as I am informed, its circulation is far in excess of any other like periodical, either in this country or abroad. That circulation, when I joined the paper, I understood to be about thirty thousand copies weekly, and when I left it its circulation had risen to nearly fifty thousand. I derived this information from the statements of the proprietors.

Q. 7. Apart from your connection with the *Scientific American*, state any other opportunities you may have had for acquiring knowledge of new improvements and inventions?

A. In February, 1877, and before I severed my connection with the *Scientific American*, I was appointed the editor of *Appleton's Encyclopedia of Applied Mechanics*, a work covering the field of mechanical engineering, and, to a considerable extent, that of applied physics. The original idea was to revise Appleton's old *Dictionary of Mechanics*, originally published in 1850, so as to bring it up to the time; but ultimately, for many reasons, it was decided to make the work, almost entirely, over new, and give it a new title. On this task I was engaged for three years, and it peremptorily required of me to make careful studies into a great number of scientific subjects and researches into the state of many arts. In this connection, in 1879, I reviewed all I could find published on the subject of the telephone, and prepared therefrom an article upon that apparatus.

Q. 8. After Reis' telephone, what instrument or instruments did you next learn of relating to the same general subject of the transmission of sounds by electricity?

A. Gray's telephone; and then, I think, La Cam's—both musical telephones.

Q. 9. What did you understand to be the main objects sought in these instruments?

A. Two; first, the transmission of music, by which I mean sounds corresponding in pitch with those emitted, with, for example, any musical instrument; and second, what I regarded as of much greater commercial advantage, harmonic multiple telegraphy, or the sending through a single conductor, of many signals simultaneously, in sounds of different pitch, which would affect, or be separated or disentangled, by reeds, for example, vibrating synchronously with the sounds of varying pitch transmitted—said reeds being located at the receiving station. It is perhaps proper for me to state here, that the idea of transmitting the human voice by electricity was then well known to me, but I regarded the possibility of any apparatus in that direction to be closely limited to the transmission of the pitch of the voice, and to some extent its loudness, and not in anywise to include the transmission of its quality or articulation. In other words, in that connection the human vocal organs became simply a musical instrument, the sounds of which the telephone reproduced in its own particular voice.

Q. 10. Then, if I understand you correctly, those harmonic musical telegraphs, or musical telephones, were able to transmit or reproduce vocal sounds or sounds made by the human vocal organs, by reproducing the pitch, and to some extent the loudness of the sounds, but were not able to reproduce the quality, and hence were not able successfully to transmit and reproduce articulate speech. Am I correct?

A. Exactly; the differences in loudness, however, in the sounds transmitted and reproduced, I do not think were much marked. The main thing transmitted by these instruments was pitch.

Q. 11. Will you please explain, a little more particularly, how the musical telephone was able to be employed as a multiple telegraph; that is to say, by what means two different transmitting instruments could be used with a single electric circuit, and two receiving instruments, in such a manner that one of the receiving instruments would receive the message from one of the transmitting instruments, and the other receiver would receive the message from the other transmitter, without mixing up the messages?

A. I will illustrate this in the simplest way possible. First suppose three tuning-forks, A, B and C; two, A and B, tuned to the same note and the other, C, tuned to a different note. If the tuning fork A be struck, and thus thrown into vibration, it will be found that the tuning-fork B, placed near it, will also be thrown into vibration, through the medium of the sound waves passing through the air, and that the sound due to this vibration of B, will be heard after A is damped. On the other hand, it will be found that the fact of A being set in vibration had no audible effect upon the differently tuned fork C. Or, in other words, that two forks in unison will vibrate together and be set in vibration one by the other; whereas, of two forks not in unison the reverse is true. Extending this a little further; suppose, say half a dozen differently tuned forks, A, B, C, D, E, F, be arranged conveniently together, and suppose three persons should strike three other tuning-forks respectively in unison with A, B and C of the series; then A, B and C only would be thrown into vibration and would respond.

Now suppose the three persons mentioned should strike their tuning forks simultaneously and in a particular way; say that each person should make the signals of a different telegraphic message, in the Morse alphabet, by taps on his fork. Clearly, the result of all these taps sounding together, would be a confused jumble to the ear; but when the combined sounds reached the three tuning-forks, A, B and C, they would be disentangled. The tuning-fork A would be entirely indifferent, audibly, to the vibrations affecting B and C, and would not reproduce them, but would pick out and respond only to those emanating from the fork in unison with it.

A like result is true of forks B and C, and consequently, three messages, made simultaneously, might thus be transmitted through the air, and analyzed at the receiving forks.

It is easy now to apply this to multiple harmonic telegraphy, in which the vibrations are transmitted by the electric current, through a wire, instead of by waves of condensation and rarifaction in the air.

The apparatus in perhaps its simplest form may be described as follows: a battery; a tuning-fork, so arranged that one of its arms when vibrating will make and break the circuit in a wire leading from the battery; then a prolongation of this wire, to form the line; the coiling of this wire around a core, to form an electro-magnet; then the connection of the wire to the other pole of the battery.

Over the pole of the electro-magnet is a reed of steel or iron so arranged as at it its natural rate to vibrate synchronously and in unison with the tuning-fork.

Now, when the tuning-fork is set in motion, at every vibration it will make and break the current, so that the latter will traverse the line in a series of impulses, which in turn intermittently energize the electro-magnet, and this, by attracting and releasing the vibrating reed in front of its pole, causes in the reed vibrations synchronous with, and therefore of like pitch to, those emitted by the tuning-fork.

From what has been already explained, it will be obvious that if another tuning-fork, of different pitch, be arranged in connection with the same line wire, the vibrations transmitted by that fork will not affect the reed at the other end, but will affect a second reed, of like pitch to itself, if inserted in the circuit. This brings me to the conditions named in the question.

If the two tuning-forks alluded to be sounded together, then the electrical impulses from each, moving at different rates at the same moment, will traverse the wire simultaneously, and these will be disentangled by each of the two reeds at the receiving end, vibrating responsively under the impulse of the fork in unison with it. In this manner two messages are sent simultaneously over a single wire, and received by sound, separately from different reeds. Of course, this principle, true for two messages, can be extended to a greater number.

Recess for lunch.

March 4th, 1882, 2.30, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Q. 12. When did you first learn of Alexander Graham Bell's alleged invention of the telephone?

A. To the best of my recollection, quite early in 1876. I think it must have been either soon after the issue of his patent of March 7th, or possibly after the delivery of a lecture, or paper, by him before the American Academy of Arts and Sciences, of Boston. I don't recollect paying much attention to the matter at the time, though I have quite a distinct impression, that I then thought it was a harmonic telephonic device, belonging to the same general class as the apparatus referred to in my last answer.

Later in the summer, I heard more about it, and my impression is, that I prepared the article on Bell's contrivance, which appeared in the *Scientific American* of September 9th, 1876, which article I think was the first, that was published in that journal, giving an intelligible account of the device.

Either shortly before or shortly after that date, I was at the Centennial Exhibition and took occasion to look for Professor Bell's telephone, which I heard was there, and failed to find it, although I think at the time I saw Gray's harmonic telephone exhibited there, but not in operation. I first saw Bell's telephone in the square-box form, about as shown in his patent of January, 1877, in March of that year, when one of the instruments was sent to the *Scientific American* office to have an engraving made from it. That engraving, with others relating to the subject, some of which were reproduced from the patent drawings attached to the patent of that date, was published in the *Scientific Ameri-*

can of March 31st, 1877, and I believe that I prepared the accompanying article.

I first personally used and experimented with the Bell telephone, I think, in the fall of 1877, when two small hand instruments, in the ordinary well-known form, were sent to the *Scientific American* office for our examination, I believe. I took these to my residence and tried them on a short line. I might add, that the first really definite information that I gained concerning the Bell telephone, apart from the patent, I heard from Professor Bell himself, in the lecture which he delivered in this city in the spring of 1877.

Q. 13. In view of the statements you have now made, of your opportunities of becoming familiar with the mechanic arts, and of your knowledge of electricity and its associated arts, were you, or were you not, in your opinion, sufficiently familiar with the general state of the art of transmitting sound by electricity, in March, 1876, to have been able at that time to intelligently appreciate the relation of a telephone, that would transmit articulate speech by electricity, to other machines of the same general class, that had been described in prior publications, and with which you were familiar, as you have testified?

A. Yes, I think I was; sufficiently, in part, to have enabled me to do then, as I did afterwards, write about the subject intelligently, for the information of the public.

Q. 14. Have you made any detailed investigation into the state of the art since you were engaged, some time in the fall of 1881, to testify as an expert in this suit?

A. No, sir.

Q. 15. Have you read, and do you understand, the testimony given in this suit on the part of the complainants, by their expert, Professor Charles R. Cross. If yes, state whether you do, or do not, agree with that witness in such opinions as he there expresses, relative to the theory of electric telephones capable of transmitting and receiving articulate speech?

A. I have read, and I understand, the testimony of Professor Cross, heretofore given in this suit, both in the complainant's *prima facie* case, and in the affidavit made by him, which I find in the printed record of Complainants' moving papers for a preliminary injunction. From his application of the theories he offers, specifically to what he finds set forth in Bell's patent of March 7th, 1876, I mainly dissent, for reasons to which I may take another opportunity to refer, as they are not now called for.

I understand the question to confine me to the consideration fo the general theories propounded by Professor Cross, in their broad application to the telephonic apparatus. His statement of the theory of the production of sound, and of the undulatory nature of the movement of the air particles, resulting in vibrations having the three characteristics, of loudness, pitch and quality, fairly and ably describe views which I think are accepted by all scientific men. His explanation of the operation of the two magneto-telephones, one serving as a transmitter, and the other as a receiver, namely; the diaphragm of the transmitter being set in motion by the movement of the air particles due to the production of sound by the voice, and vibrating in accordance therewith, causing electrical currents corresponding in frequency in character to be produced in a closed circuit; and that these currents affect a magnet which in turn influences the diaphragm of the receiver, causing it to vibrate so as to reproduce the original sound, expresses what I believe to be the correct theory, though it is not the only one that has been suggested to explain the phenomena observed, nor does it fully account for all of said phenomena.

In this connection the molecular theory has been advanced, accounting for some of the results observed by supposed changes in the molecular arrangement of the magnets under the influence of the current.

I fully agree with Professor Cross in such statements as he makes relative to the practical impossibility of articulate speech being transmitted by any telephonic system which relies upon a making and breaking of the current in order to transmit the vibrations. I am aware that the fact has been frequently published, that with Reis' instrument, which is constructed on the make-and-break principle, and to which I have already referred, and with other analogous devices, certain sounds of the human voice have been transmitted. But I am unable to discover that these sounds were other than merely fragmentary, depending solely for their existence upon the momentarily continued contact of the diaphragm and point, or their equivalent, and limited, I believe, chiefly to vowel sounds I regard it as certain, that under no circumstances can articulate vocal souuds be transmitted by such an arrangement except when continuous contact between the contact-pieces exists; and even then, I do not know that it has been definitely determined how, exactly, to adjust these pieces for the purpose—in the Reis instrument, for example.

I understood, as early as 1870, the inability of the Reis instrument to transmit articulate speech, and I have never since heard that it has come into use for the transmission of articulate speech; that it has, or is, practicably been made capable of doing so. I am satisfied, therefore, that the use of the undulatory current is essential to the transmission of articulate speech; and conversely, I fully agree with Professor Cross in the opinion substantially expressed by him, namely, that any electric telephonic device which does actually transmit articulate speech, must operate, and operate only, through the medium of the unbroken undulatory current. So that, to illustrate, if I was shown an instrument connected with an electric circuit wire, even if I were wholly ignorant of the internal construction of that instrument, if I heard speech through it, I should be convinced; first, that that instrument was not operated by a make-or-break current; and second, that it was operated by a current unbroken and undulatory. This is my own conclusion, and it seems to me also a necessary one, from the opinions and reasons given by Professor Cross. I also agree with Professor Cross in so much of his explanation of the possibility of operating telephones in general by variations in the electro-motive force of the current; and, as to how vibrations may be caused in the current by the converse method of changing the resistance of a suitable medium, through which the current is conducted. His theories on these points are in the abstract, I believe, correct.

The foregoing, I think, covers all that I am asked in the question.

Q. 16. Please look at the patent of Alexander Graham Bell, dated March 7th, 1876, No. 174,465, and more particularly at the claims thereof, and state what you find set forth therein. You may refer, if you please, to the opinions expressed by Professor Cross, in his testimony heretofore given in this suit, in relation to said patent, and also, if you please, to any general knowledge which you may have had on the subject of electric telegraphs or electric telephones, at and before the date of said patent?

A. I have already referred to the theories advanced by Professor Cross, regarding telephones in general, mainly to agree with him; but in a previous answer I stated that I dissented from his application of his theories to the device set forth in Bell's patent of March 7th, 1876.

ELEPHONE COMPANY,-2

In answering the present question I am necessarily led to give my reasons for my dissenting views.

If I understand Professor Cross correctly, he asserts that he finds set forth in the patent above named, the method, principle and mode of operation of the main forms of speaking telephones made since its date. This statement appears on page 40 of this affidavit in Complainants' moving papers for a preliminary injunction, and he goes on to say, as follows: "So far as I am aware, these various modifications have been introduced in order to increase the partial efficiency of the method so described by Mr. Bell, and every change has been simply an endeavor to effect an improvement in the practical application of the new art set forth in said specification; the new method, which he described in said specification, and referred to in the fifth claim thereof, underlies them all and includes them all."

I trust I shall not be considered as invading the region of argument if I say that it seems to me, in view of the foregoing quotation, that if exactness and certainty are anywhere requisite, it is in a patent wherein the inventor undertakes to instruct people in an alleged great and original conception; for certainly, if an art is wholly new, not much can be left to be supplied by readers skilled in it, for logically there are none such.

If Mr. Bell, as Professor Cross seeks to explain, did, in this patent, bridge the gulf between the old harmonic telephone and the more modern speaking telephone, then, it seems to me that that fact should appear to the student, or at least I should expect to find it, not merely from inference, but clearly and unambiguously described and embodied in an operative contrivance. Professor Cross, in his *prima facie* testimony, refers mainly to the fifth claim of the patent. I have been questioned as to the whole patent, which I have read, and understand. *The first claim* recites, "A system of telegraphy in which the receiver is set in vibration by the employment of undulatory currents of electricity, substantially as set forth."

Adjourned until 10.30, A. M., on Tuesday, March 7th, 1882.

Tuesday, March 7th, 1882, 10.45, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Storrow for Complainants, and Mr. Hill and Mr. Jacobs for Respondents.

Examination of Mr. Park Benjamin by Mr. Hill continued:

[*Answer resumed.*]

Broadly regarded, I understand that any system of electric telegraphy involves a device for transmitting signals, the conductor through which they pass, a device for receiving them, and a source of electricity. I understand the particular system recited in the claim, to be one in which the receiver is set in vibration by undulatory currents of electricity; that is, in contrast with a system in which the receiver is set in vibration by intermittent, or "make-and-break," currents of electricity. I understand the word receiver here to mean, any form of receiving device capable of being operated in a vibratory manner, by said undulatory current. I do not understand that in this claim the inventor limits himself to any particular manner of vibration of the receiver; and hence, should regard it as immaterial whether the receiver be, for example, a galvanometer, indicating the signal sent, by the vibration of its needle, or a reed vibrating in front of the pole of an electro-magnet, or a lever caused to vibrate by the influence of an electro-magnet, and thus caused to give sound signals by striking a bell, or to operate suitable recording mechanism. All of these devices are means for receiving signals in a system of telegraphy. All vibrate, and all are capable of being worked by an undulatory current.

Professor Bell states, in his specification, as follows: "It has long been known that when a permanent magnet is caused to approach the pole of an electro-magnet a current of electricty is induced in the coils latter, and that when it is made to recede a current of opposite polarity to the first appears upon the wire. When, therefore, a permanent magnet is caused to vibrate in front of the pole of an electro-magnet, an undulatory current of electricity is induced in the coils of the electro-magnet, the undulations of which correspond in rapidity of succession, to the vibrations of the magnet, in polarity to the direction of its motion, and in intensity to the amplitude of its vibration."

This being the case, about as simple a way as can be suggested of recognizing the induced current in the coil of the electro-magnet is to place a galvanometer in the the circuit therewith. Then, I think, there will be present all the elements set forth in the first claim, as the undulatory current will be produced as stated. And such could be done so that it would cause the galvanometer needle to vibrate, to make signals in some particular way, and hence, said galvanometer would be, as already pointed out, a receiver set in vibration by the employment of undulatory currents of electricity.

I think the fact will hardly be disputed, that telegraph systems using the magneto-electric undulatory current, were known and operated long before the days of Bell's invention, and were, in fact, among the first forms of telegraphing used. To this class, for example, belongs the old Wheatstone, A, B, C, system, in which the current was generated by the revolution of an armature before the poles of a magnet, and the current thus obtained was transmitted through coils of wire surrounding said poles, and thence to an indicator, or dial, whereon the signals were shown. Here the currents were produced without at all disturbing the continuity of the circuit, which, in fact, was never broken. Without further description, I will refer, for example, to a work entitled "*Telegraphy*," by W. H. Preece and J. Sivewright, bearing date, "New York, 1876," page 76, for a simple explanation of this system, and also to Dr. Turnbull's lectures on the telegraph, published in the *Journal of the Franklin Institute*, for 1851 and 1852, volumes, 21, 22, and 23, for descriptions of many early forms of telegraph, in which undulatory currents and closed circuits were employed.

I am also aware of a publication of a system of telegraphy, in which the undulatory current is employed in a closed circuit, which appeared in the *Telegraphic and Electrical Review*, a London, England, periodical, volume 1, dated November, 1872, and November, 1873. This reference was brought to my notice since the beginning of this suit, and a certified copy of the article and accompanying illustrations I now produce.

[*Mr. Hill offers the paper produced by the witness in evidence and the same is marked* "*Exhibit Wheatstone Undulatory Current Telegraph*"]

[*Mr. Storrow objects to the name used to designate this exhibit, as a misnomer and misdescription of it.*]

I find described, an apparatus whereby a machine is caused to telegraph to a distance automatically its periodical motions. It is stated, that, as far back as 1840, Sir C. Wheatstone invented an instrument for this purpose involving the use of voltaic electricity. The article then goes on to point out sundry disadvantages of the voltaic battery, and says that the difficulty "was subsequently overcome by the inventor employing magneto-electric currents, and the following is a description of a suitable apparatus for the generation of these currents, in which the current is never broken." The description and drawings set forth an apparatus consisting of a permanent magnet, two coils of wire, with soft iron cores, and a soft iron armature, disposed as shown in figures 1, of the drawings. The armature is attached to a spring, which brings it up to the magnetic poles, and by a suitable mechanism, such, for example, as the eccentric and pitman shown in figure 3, it is caused to approach and recede from said poles, thus inducing alternating currents in the wire coils. These currents are communicated by a leading wire to the register or indicator, shown in figure 2, where it is stated, they act by means of an electro-magnet, upon a "step-by-step" motion, which in turn operates the pointers of the dials, so recording the revolutions of the wheel, for instance.

It is further stated, that in the *Times* printing office several of these automatic registers are employed to record the number of impressions produced by the various printing machines, and that said registers are placed in the office of the manager, and the generators are attached to the presses in the printing room. By this arrangement, it is said, the number of impressions for a given time can be recorded, and any delay in the working of the machines noted.

In view of all the reasons above cited, I conclude, that the first claim of Bell's patent of March 7th, 1876, sets forth nothing but what was old and well known in the act at the date thereof; unless it be understood to relate and refer substantially to the same construction, as is set forth in the fifth claim; and to this I shall more particularly make reference in another part of this answer.

IN THE SECOND CLAIM I find set forth the combination of a permanent magnet, or other body capable of inductive action, with a closed circuit, so that the vibration of the one shall occasion electrical undulations in the other and in itself, and this, under three conditions, namely; first, when the permanent magnet is set in vibration in the neighborhood of the conducting wire forming the circuit; second, when the conducting wire is set in vibration in the neighborhood of the permanent magnet; and third, when the conducting wire and permanent magnet both simultaneously are set in vibration in each other's neighborhood. There is no specific mention, in this claim, as in the preceding claim, of the application of what is there recited to a system of telegraphy. Regarding the claim broadly, it merely recites a well known

ELEPHONE COMPANY,-2

and fundamental experiment in magneto-electric induction, dating, I think, from 1831, or thereabouts. This consisted simply in connecting a continuous coil of wire with a galvanometer and inserting a permanent magnet in the hollow of the coil. By causing the magnet and the coil to alternately approach and withdraw from each other, momentary induced currents, flowing alternately in opposite directions, are produced in the line, and are received and shown in the galvanometer. This experiment, and the laws which it demonstrates, lie at the foundation of the construction of modern magneto electric machines for mechanically producing an electric current. The references already given with regard to the first claim also substantially apply to this one, for the same reasons, so far as they show the combination of the permanent magnet and closed circuit, as set forth. Hence, regarding this claim, I reach the same conclusion as already noted with reference to the first claim, namely, that it describes no invention of Mr. Bell's; unless it be understood as referring to the same construction as set forth in the fifth claim, hereafter to be referred to.

THE THIRD CLAIM recites a method of producing undulations in a continuous voltaic current by the vibration or motion of bodies capable of inductive action, or by the vibration or motion of the conducting wire itself, in the neighborhood of such bodies. As a permanent magnet is a body capable of inductive action, and is so referred to in the preceding claim, this third claim substantially recites the addition of a voltaic current to the circuit, in which magneto-electric currents circulate. It therefore takes a subsidiary part, so far as the production of undulations in the current is concerned. When, however, permanent magnets are not used, then the voltaic current may energize the electro-magnets, or maintain a current passing through the circuit, in which undulations may be produced by the vibration of bodies capable of inductive action, or of the wire near such bodies. This, broadly regarded, amounts simply to the statement of a well known result, founded on many experiments, and described mainly by Faraday, on which he founded many of the laws of galvanic induction. Without going into further detail, it will suffice me to say, that I regard this claim very much in the same light that I do the others referred to; and that is, that it cannot, in view of the state of the art, be given the broad signification which might otherwise be attached to its language, but must be taken, as in the case of the two preceding claims, with reference to what is recited in the fifth claim.

With regard to the three claims thus far considered, and the specifications relating to them, while I do find set forth therein a telegraphic system operating by undulatory currents, I find nothing specifically denoting that the signals in this system are to be received by sound, to the exclusion of other means of receiving the signal. It is true that the specification describes a system in which sound is the medium through which the messages are read; but I do not understand that the inventor confines himself thereto, nor can I conclude otherwise than that, in the three claims mentioned, signals sent by an undulatory current and made appreciable to the eye, say by the movement of a needle, are included in the language used. If, therefore, signals received by sound are not to be regarded as specifically referred to in the first three claims, it certainly seems to me that signals to be received in a particular variety of sounds, namely, articulate speech, are still further from being specifically set forth therein.

IN THE FOURTH CLAIM I find recited two processes for producing undulations in a continuous voltaic circuit; first, by gradually increasing or diminishing the resistance of the circuit, or second, by gradually increasing or diminishing the power of the battery.

Professor Cross says that it was well known before Mr. Bell's patent that the strength of a current could be varied either by varying the electro-motive force, or by varying the resistance. Consequently, in consulting the specification to find out what Professor Bell's process is for producing undulations in his circuit by varying the resistance, I naturally look for some particular way of doing this, because the fact that it could be done, gradually or otherwise, was already admittedly well known. All I find on this subject is the following: "The internal resistance of a battery is diminished by bringing the voltaic elements nearer together, and increased by placing them further apart. The reciprocal vibration of the elements of the battery, therefore, occasions an undulatory action of the voltaic current. The external resistance may also be varied. For instance, let mercury or some other liquid form part of a voltaic circuit, then the more deeply the conducting wire is immersed in the mercury or other liquid the less resistance does the liquid offer to the passage of the current. Hence, the vibration of the conducting wire in mercury or other liquid included in the circuit, occasions undulation in the current."

There certainly was nothing new, at the date of Mr. Bell's patent, in altering the internal resistance of a cell by moving the plates farther apart or nearer together, and so changing the thickness, and hence, the resistance of the column of liquid between them. This knowledge I take to be about as old as the invention of the galvanic battery itself. Consequently, I conclude that Professor Bell's invention, if he has made any in the matter, must lie in the means for gradually moving the elements. But he doesn't describe any means, either generally or in detail; gives no drawing illustrating the same; nor in fact, so far as I can see, imparts any information on the subject, other than that, as a result of so moving the elements in a battery gradually, undulatory currents may be produced. From which information I fail to conceive how anybody could make an operative contrivance. In referring to varying the external resistance, he is a little more specific, but he tells nothing as to how his apparatus is to be arranged; gives no drawing of it, nor, in fact, presents such information as I should consider necessary to produce an operative machine.

The reference in the second part of the claim to increasing or diminishing the "power" of the battery, is rather vague, from the undefined use of the word "power," which, however, I infer here stands for strength of current. In this connection the specification says: "The vertical vibrations of the elements of a battery in the liquid in which they are immersed produces an undulatery action in the current by alternately increasing and diminishing the power of the battery." It was well known long before the date of Mr. Bell's patent that if you lift the elements of a cell out of the solution altogether, you stop its working; and that the deeper you lower the plates, for instance, in the liquid, the greater the working area of the plate, and hence, the greater the strength of the current. Arrangements for raising and lowering plates in a battery appear in the old Hare Calorimotor, which is published in *Appleton's Dictionary of Mechanics*, of 1851, volume 1, page 433. Consequently, I conclude again, that if Professor Bell has invented anything in this connection it should appear in means for gradually raising and lowering the elements of the battery, so as to produce undulatory currents. But I find no such means described in the patent; no drawings of anything of the sort; and all the information on the subject which is given appears to be summed up in the sentence quoted, from which, it is hardly necessary to point out, an operative device could not be made.

Consequently, in the fourth claim, duly considered with the specification, I do not find such information as will enable anyone skilled in the art to construct the apparatus referred to, or any information regarding any principle or general discovery which, so far as I am aware, was not already known.

Recess for lunch until 2.20, P. M.

March 7th, 1882, 2.20, P. M.

Examination resumed pursuant to adjournment.

Present, same counsel.

[*Mr. Benjamin continues.*] I am aware that Professor Cross, in his testimony in Complainant's *prima facie* case in this suit, dwells upon the FIFTH CLAIM of the patent, which appears to be the one put in issue by the Complainants, and leaves out particular reference to the four claims which I have thus far discussed. With the subject matter, which he finds set forth in this claim, and the specification, he compares the Klemm transmitter and the Tisdel receiver, which apparatus, he says, "Contains a transmitter, which, from its construction, is adapted to produce electrical undulations, as described, and a receiver, which is adapted to retranslate these electrical undulations into vibrations of the air." In examining his testimony in comparison with the patent, I have been at a loss to understand why he limits himself, or was limited, to the consideration of this fifth claim only; because, according to his own reasoning, if the apparatus contains what he finds in it, apparently it includes the elements set forth in the other claims. I mention this merely as a circumstance affecting my mind, in support of the view I have taken regarding the first three claims of the patent; that is, that they are either unjustifiably broad, in view of the state of the art, or else must be understood as setting forth no more than is found in the *fifth claim.* I propose now to examine this fifth claim and specification in detail.

It is the only claim in which the transmission of sound is mentioned; and it specifically says, "vocal or other sounds." A vocal sound is not necessarily speech, so that, if it be assumed that the term is meant to include articulate speech, in view of the state of the art, which shows that some vocal sounds could be transmitted by the Reis telephone, for example, that fact I must gather from the specification. In the specification and drawing, I find, described and illustrated, a device consisting of an electro-magnet, *A*, having a coil only upon one of its legs, *b*; a steel spring armature, *c*, clamped by one extremity to the uncovered leg, *b*, of the magnet, and its free end allowed to project above the pole of the covered leg. In voltaic circuit with this instrument is placed a similar instrument, the circuit being closed through the coils of the electro-magnets, and a battery. One of these instruments, I understand, is used as a transmitter, the other one as a receiver, and when the armature of the transmitter is set in vibration, to produce its musical note, the specification says: "A powerful inductive action takes place, and electrical undulations traverse the circuit; the vibratory current, passing through the coils of the electro-magnet of the receiver, sets the armature of that instrument in vibration when the armatures of the two instruments are in unison with each other; but the armature of the receiving instrument is not affected by the passage of an undulatory current when the pitches of the two instruments are different."

Referring back, now, to the beginning of the specification, Professor Bell mentions a prior patent granted to him for a multiple harmonic telegraph apparatus using a "make-and-break" current, and constructed and operating in substantially the same way as the typical instrument of that class, which I explained in a previous answer. Further on in the specification he says that, in a pending application for letters patent, he describes two ways for producing an intermittent current; one by "make-and-break" of contact, the other by alternately increasing and diminishing the intensity of the current, without breaking circuit. This last current he calls a "pulsatory current." Then, he says, that his "present invention consists in the employment of a vibratory or undulatory current of electricity, in contradistinction to a merely intermittent or pulsatory current, and of a method of, and apparatus for, producing electrical undulations upon the line wire." Then he goes on to give a list of the advantages which he claims to derive from the use of the undulatory current, which are, first, that more signals can be transmitted simultaneously in the same circuit; second, that a closed circuit and single main battery may be used; third, that communication in both directions may be established without the necessity of induction coils; fourth, that cable dispatches may be transmitted more rapidly than was hitherto possible; and fifth, that, as the circuit is never broken, a spark-arrester becomes unnecessary. How he is enabled to transmit a large number of signals simultaneously is described in the specification, and is shown in figure six of the drawing. He shows how a number of instruments constructed as already explained, may be placed upon a telegraphic circuit; points out how signals from one instrument of a given pitch will be repeated by all other instruments in the circuit having armatures normally vibrating in unison with it and by none others; and states that, hence by these instruments, two or more telegraphic signals or messages may be sent simultaneously over the same circuit, without interfering with one another. So far there is described a system of multiple harmonic telegraphy, to which the undulatory current is applied. Mr. Bell now goes on to state that not only is the pitch of his musical notes transmitted, but also the loudness; and although he doesn't indicate any particular advantage to be derived from this, still it is none the less true, that in transmitting sounds in both pitch and loudness, he accomplished something which could not be certainly done in any of the earlier forms of "make-and-break" telephones that I know of. I said in a previous answer that the Reis telephone, for example, transmitted loudness to a certain extent; but when it did this, the effect, I think, was an accidental one, depending upon temporary contact of the contact-pieces; and although it can be explained by what has since been learned, I am not aware that it was at all explained when the Reis invention was originally made public. Besides stating that his apparatus will transmit musical notes differing both in loudness and pitch, Mr. Bell explains in some detail the graphic method of representing an electrical undulation by curves, represented in figure 4, which curves show pitch and loudness, the one by the length of the waves, the other by their height or depth.

I desire to call attention to the fact now, that Professor Bell nowhere says that the curves, which he represents, show anything but pitch and loudness, nor does he intimate, in any part of the specification thus far referred to, that his instrument is capable of transmitting any other characteristic of sound than these two. But Professor Cross has clearly pointed out, and I have agreed with him, that in order to transmit articulate speech, it is absolutely necessary that the instruments should be capable of transmitting the third characteristic of sound; namely, quality, in addition to the other two characteristics of pitch and loudness. It is on this capability that, as Professor Cross shows, the very existence of the electric speaking-telephone may be regarded as depending. Without this capability, no instrument can be an electric speaking telephone, because, admittedly, in the devising, no matter now by whom, of instruments which possess the power, it is that the great and original feature of the invention of the electric speaking telephone resided. Now I understand it to be substantially asserted by Professor

Cross on the part of the Complainants, that all mankind was ignorant of the possibility of constructing such an instrument; that all inventors stood non-plussed before the problem until Professor Bell revealed its solution to the world in the patent now under consideration. Hence the pertinence and the importance of careful scrutiny on my part of what is set forth in this patent, to find out how far, if at all, it gives this information. In this connection, therefore, I have deemed it proper to look at Mr. Bell's testimony in this case; and more particularly to such statements as he makes regarding the knowledge he possessed of the theory of sound, prior to making application for this patent. With all the characteristics of sound he appeared to be well familiar, and had indeed made a special study of the subject. He even made a "Phonautograph" and reproduced thereby, as he says, sound-tracings, somewhat, I understand, analogous to those represented by illustrations in Professor Cross' testimony in this case, showing in themselves, graphically, all the three characteristics of articulate speech. Hence I infer that he was familiar with the appearance of such graphic representations. Knowing these facts, therefore, as to the extent of Professor Bell's information, I am forced to conclude that, when he omitted mention of the possibility of the instrument described in his patent under consideration transmitting *quality*, he did so purposely and advisedly. From all I can gather from his testimony, and from his statements in his patent, he seems to have known what had been accomplished in the way of transmitting sound by electricity, and I cannot conceive of any one having such knowledge deliberately leaving out in a patent all specific reference to a capability of his instrument, whereby would have been effected, had it been present, such an enormous advance in the art, or even his leaving the same to be discovered by inference at a later day. In the list of advantages which I have quoted, he makes no mention of this, which would have been immeasurably the greatest of all. He says in his specification, that the sinusoidal curve *A* or *B*, figure 4, represents graphically the electrical undulations induced in the circuit by the vibration of a body capable of inductive action, and adds nothing to show that he doesn't intend the curve to represent all the vibrations induced, so far as he intended them to be transmitted. And finally, as if to clinch the conclusion, that he left out reference to quality in this patent, the main portion of which is given up to the description of a multiple harmonic telephone, I find him specifically stating in his testimony, in answer to interrogatory 65, that it is of no advantage whatever for a system of multiple harmonic telegraphy to transmit quality as well as pitch of sound.

Adjourned until March 8th, 1882, at 10.30, A. M.

March 8th, 1882, 10.30, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Mr. Park Benjamin by Mr. Hill continued.

(*Answer resumed.*) I have already referred to the fact, that in his testimony, in Complainant's *prima facie* case in this suit, Professor Cross examines specifically only the fifth claim of Bell's patent of March 7th, 1876, and, after explaining in some detail what he considers to be the theory of the apparatus which he finds referred to in that claim, in his answers to the 11th and 12th interrogatories, he describes more particularly what he regards to be the apparatus itself, and its functions; and this apparatus, he states, he finds represented in figure 7 of the drawings attached to Bell's patent of March 7th, 1876. I was somewhat at a loss, at first, clearly to comprehend why Professor Cross singled out this particular apparatus to the exclusion of the conclusions I have reached, and which I have expressed, concerning the subject-matter of the first three claims to what is recited in this fifth and last claim; and in order to obtain, if possible, a clear understanding of Professor Cross' position in the matter I have referred back to the somewhat fuller statements which he makes in his affidavit used in Complainant's motion for a preliminary injunction in this suit. There I find that Professor Cross gives reasons for this specific reference to figure 7, very clearly and succinctly, in the following words which I quote from page 35 of his affidavit, folio 46: "The instrument shows at A, figure 7, is a mechanical, but a most essential, modification of A, figure 5; both depend upon the same electrical principle, but *by reason of the entire change of structure*, shown in figure 7, it has become capable of transmitting vocal sounds of all kinds, including articulate speech." I have italicized the words in the preceding quotation, because, taken all together, I think this to be about the most important statement Professor Cross has made affecting this case. There seems to me to be but one meaning possible of the language he uses, and that is, that when Professor Bell changed his contrivance from the form shown in figure 5 to the form shown in figure 7 he then solved the problem of transmitting articulate speech by electricity. Both devices, as shown in figure 5 and figure 7, substantially says Professor Cross, are alike in electrical principles, but, in the apparatus shown in figure 7, something new comes in the form of a "most essential modification" of the apparatus shown in figure 5, which involves an "entire change of structure," and through this modification the wonderful result of transmitting articulate speech by electricity is made possible. It is hardly necessary now for me to dwell upon the importance of finding out, by comparison of the apparatus shown respectively in figure 5 and figure 7, what this modification is.

I have already stated what I find in figure 5, namely, an electro-magnet having a coil on one leg, and a steel spring armature extending over and vibrating in front of the pole of the electro-magnet; another instrument of the same construction, and a voltaic circuit connecting them through the coils. And referring to figure 7, I find an electro-magnet having on one of its legs a coil, exactly as in figure 5; an armature attached by one extremity to the uncovered leg, in a manner substantially like that shown in figure 5, with the free end of the armature vibrating in front of the pole of the electro-magnet, also as in figure 5. Connected with this instrument is a voltaic circuit, also as in figure 5; and in this circuit is another instrument constructed in the manner already described, and again also as in figure 5. The circuits shown in figures 5 and 7 are both closed circuits through the coils; the first being closed entirely through wire, and the second being closed through the earth, which is here an immaterial difference. The construction of the instruments is so far the same; they are arranged in a like circuit in the same way, and they are both capable of performing the same result. The difference shown in the method of attaching the armature to the uncovered leg of the magnet, in figure 5 by clamping, and in figure 7 by hinging, is immaterial, in view of the fact that in the first case the magnet is shown standing upright, and in the second turned on its side. So far then, as I have described them, the two instruments shown in figures 5 and 7, are substantially, and nearly identically, the same; so that it will be obvious that the apparatus shown in figure 7 includes all that there is of the apparatus shown in figure 5, and something more; and that in this something more, I must now necessarily look for the "most essential modification" and "entire change of structure," which, according to Professor Cross, gives to the apparatus the extraordinary capability, which, by inference, he asserts the apparatus shown in figure 5, did not possess.

Now, all that there is shown and described in figure 7, which is not shown and described in figure 5, are the cones, *A* and *L*, with the membranes, *a* and *i*, stretched across their inner ends. The patent says, that the function of the cone *A* is to converge sound vibrations upon the membrane *a*, which vibrations are transmitted from that membrane to the armature, *C*, of the magnet. Similarly the vibrations of the armature of the receiving magnet are transmitted to the membrane of the other cone, *L*, which cone converges these vibrations into the ear applied to its small end.

It is certainly clear that the cone and membrane here take no part whatever in the electric transmission of sound. They serve no other purpose, and none is suggested for them, than that of concentrating upon the armature or ear-drum, vibrations which otherwise might be widely diffused in the air, and in great measure lost. For this purpose, the use of a cover or tube and membrane was perfectly well known long before the date of Mr. Bell's patent. It is nature's contrivance in the human ear, and it existed in the "Phonautograph," which Mr. Bell made and describes. If the instrument was not capable of transmitting articulate speech before the cone and membrane were added, it certainly could not do so by their aid. They would be of no more use than that of a telescope to a blind man, or an ear-trumpet to a person devoid of hearing; in fact, in the present connection they are nothing but an ear-trumpet—an instrument with which Professor Bell, professionally, was doubtless very well familiar. In fact, an inspection of the drawing, figure 7, leads to the assumption that he has merely taken an ear-trumpet and cut it in two. You make a sound into the large end of the trumpet, just as before, and the instrument attached to that section of it transmits the sound through the wires to the other instrument attached to the other section, or small end of the ear-trumpet, which—as it always was—is applied to the ear of hearer. And this is all I can discover of the most "essential modification," and the "entire change of structure," which Professor Cross says renders the apparatus shown in figure 7 capable of transmitting articulate speech, whereas the apparatus shown in figure 5 was not. As a matter of fact, I think there is no entire change of structure in any essential part of the contrivance, as shown in the two figures. The patent itself says, that the instrument shown in figure 5 may be put to the use of the "telegraphic transmission of noises or sounds of any kind;" and I think it is perfectly obvious that if the armature is made as shown in figure 5, it will be caused to vibrate by sounds made near it, though in not so efficient a degree as when the sounds are concentrated upon it through the medium of the cone and membrane. But certainly I am unable to see any reason for the opinion expressed by Professor Cross which, as I have shown, amounts to the assertion, that the addition of the cone and membrane enables the instrument to transmit quality of sound, and hence, articulate speech.

Recess for lunch until 2, P. M.

March 8th, 1882, 2, P. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Examination of Mr. Park Benjamin by Mr. Hill continued.

(*Answer resumed.*) In the present connection I shall only say further, that if a cone and membrane, as shown in figure 7, is of the great importance that Professor Cross attaches to it, Professor Bell doesn't seem to have held a like opinion; for in his present form of magneto-telephone, he doesn't use such a cone and membrane, nor in fact, are the latter devices employed in any form of modern speaking telephone which I can now call to mind.

Furthermore, there is no specific statement in the patent that the apparatus shown in figure 7 is capable of transmitting articulate speech, any more than there is of the apparatus shown in figure 5. What is said of figure 7 is, that it shows a mode whereby motion can be imparted to the armature "by the human voice, or by means of a musical instrument." As I have already pointed out, sounds produced by the human voice are not necessarily articulate speech at all, and therefore, to construe the words quoted as indicating the capability of the apparatus to transmit such speech is, at best, a mere matter of inference, which, for the reasons already given, I do not consider justifiable.

Again reverting to Professor Bell's testimony, he says, in answer to the 101st interrogatory, that he began preparing the specification for his patent in question as early as September, 1875, at least four months before he made application for his patent. In answer to the 102d interrogatory he reads rough drafts of parts of his specifications and his claims made in October, 1875; and in the third claim, quoted on page 488 of his testimony, he recites: "The phono-telegraph, whereby the exact pitch, loudness and *timbre* of vocal or other sounds can be transmitted telegraphically," &c. All of this shows to me, first; that Professor Bell took abundant time for consideration before applying for his patent; and even went so far as to frame a claim for an instrument capable of transmitting quality of speech as well as pitch and loudness, and hence sound, with all the characteristics of articulate speech. Yet, there is no such claim embodied in his patent as issued, and not a word in it about the possibility of the instruments described, transmitting *timbre.* All of which is further evidence to my mind of his intentional omission of any claim, or statement to that effect in the patent under consideration.

There is now one more question regarding what I find in this patent which addresses itself very forcibly to me for solution, and that is this: Apart from all other considerations, is there set forth in Bell's patent of March 7th, 1876, a description of any apparatus, which, if constructed from that description by a person familiar with what had been done towards transmitting sound by electricity at the date of Bell's patent, would be an operative speaking telephone? The only way fairly to test this is to make the apparatus as set forth in figure 7 of the patent, to which, as I have said, Professor Cross specifically refers, and try the instrument in a voltaic circuit, as described. This I have done, and the instrument I now produce.

[*Mr. Hill puts the instrument in evidence as* "*Defendant's Exhibit Bell Telephone,* 1876 *Patent.*]

[*Witness continues*:] This instrument was made under my direction in the following manner: I took an ordinary printed Patent Office copy of the specifications and drawings to the Benton Manufacturing Company, a concern in this city chiefly engaged in the manufacture of models and fine experimental machinery. I instructed the workman to make the apparatus shown in figure 7 of the drawings, from what was shown in that drawing and described in the specification. I cautioned him particularly, accurately and carefully to follow the directions contained in the specification and drawing, and not in any way to allow himself to be influenced by any knowledgo of telephonic devices, which he might have, or obtain, outside of what the patent set forth. I told him I wanted a fair reproduction from him of what was in figure 7, of the patent, using his mechanical skill, and departing from the exact dimensions of the drawing, figure 7, so far as was necessary, only to enlarge the device to adapt it for convenient practical use. It is proper to state here, that I understood the printed patent office drawing in this case, as before stated, to be a photo-lithographic reproduction of the original drawing, filed in the patent office, reduced in size. The instruments I have produced are those given to me by the Benton Manufacturing Company, in accordance with my order and instructions, as above detailed. I have carefully compared them with what is set forth in specification and drawing of Bell's patent, of March 7th, 1876, and I consider them to be a fair and substantially accurate embodiment of what is there shown, in figure 7, and described. They are about four times as large in dimensions as the reduced photo-lithographs figure 7, with the corresponding features of the instruments now produced, and I find them to closely correspond. On December 14th, 1881, I personally tested these instruments, on a closed electric wire circuit, in the shop of Daniel Drawbaugh, at Eberly's Mills, Pennsylvania. I went there because there were facilities there convenient for doing this work, and because I was then staying in Harrisburg, expecting shortly to be called to testify in this case. The method and means used in the test were as follows: The circuit extended from a room in the upper story of the shop, first cross-wise and then length-wise of the building on that floor, and then down to a corner room to the floor beneath. The distance between the two points, measured along the wire, being probably some twenty feet. I satisfied myself that ordinary speech or even quite loud tones could not be heard between the two rooms, at the ends of the line. In the wire circuit was placed a battery consisting, I think, of a single Leclanché cell. For purposes of comparison with these Bell telephones, I used two Tisdel magneto telephones, which I understood and believe to be constructed substantially as set forth in the Tisdel patent, in evidence in this case. I didn't make any comparison to determine this fact, because all I needed was two good working speaking magneto telephones, and I found that the two Tisdel instruments were such. I began by personally attaching one of those Tisdel instruments at each end of the line. I then caused another person to speak into one instrument, while I listened at the other instrument, and distinctly heard him. Then we changed places and I was spoken to, using the instrument to which I had previously listened as a transmitter, and in this way I satisfied myself that both of the Tisdel instruments used were efficient as receivers and transmitters, articulate speech being clearly and distinctly heard through them by me. This also demonstrated that the circuit was perfect. Stationing a person at the Tisdel instrument, up-stairs, to talk, I went to the room below at the other end of the line, took off the Tisdel instrument then and there affixed, and in its place attached the Bell instrument, corresponding to the one shown on the right of figure 7, and marked L, in the drawing attached to Bell's patent, using it thus as a receiving instrument, as substantially set forth in Bell's specification. On listening at this instrument I could hear no sound through it at all. I satisfied myself that the sound was going on all the time upstairs, by quickly taking off the Bell, and putting on the Tisdel instrument, several times, without giving the speaker above any warning of my intention to do so; and then from the Tisdel instrument, I could hear speech coming clearly and distinctly while on replacing the Bell device, I could, as before, hear nothing. This satisfied me that the Bell instrument was inoperative. Removing now, the Bell receiving instrument, from the line, I attached to the latter, at one end, the apparatus I had had made, in correspondence to the instrument shown at the left of figure 7, and marked A, in the drawings attached to Bell's patent, of March 7th, 1876, and at the other end a Tisdel instrument. I now used the Bell instrument as a transmitter, substantially as set forth in Bell's specification, and the Tisdel instrument as a receiver. I stationed myself at the receiving end of the line, causing another person to talk into the Bell instrument, at the transmitting end, and listened at the Tisdel instrument. I could hear nothing, although I satisfied myself that speech was going on, by stepping out of the small room in which the receiver was placed, and going to the stairway near by, where I could hear the voice of the speaker. This I did at intervals, without informing the speaker of my intention of so doing. I also attached the Bell instrument to the line myself, and did it in a particular way, twisting the connecting wires in such a way that I would know if they had been tampered with, and not telling anybody that I had done so. When I examined these connections, after the experiment, I found them as I had left them, showing to me, therefore, that the talking had been done into the Bell telephone, and not into another instrument substituted in its place.

This experiment proved to me, therefore, the inoperativeness of the Bell transmitter, as shown in Bell's patent of March, 1876, and of course the conclusion from both experiments was that the Bell transmitter would not transmit speech through an operative receiver, nor the Bell receiver receive speech through an operative transmitter; and this despite the fact, that Professor Cross has substantially testified that the

Tisdel instrument, which was the operative instrument I used, is an infringement upon Bell's patent of 1876.

It only remained now to connect the two Bell instruments, to and at opposite ends of the circuit, as shown in figure 7, and as described in Bell's specification. This I did, and caused another person to talk into the transmitter, and listened myself, at the receiver, taking such precaution to assure myself that speech was going on, as already detailed. Again I could hear nothing—no sound of any kind reaching my ear through the receiver. This completed my experiments, on the Bell instruments which I have produced, and thus finally demonstrated to me their inoperativeness for the purpose of transmitting, or receiving articulate speech by means of electricity.

In conclusion, and for the reasons which I have endeavored to give fully, what I find set forth in the Bell patent is a harmonic telephone, single or multiple, having for its important new features, so far as I can discover, the application of an undulatory current of electricity, whereby the apparatus is enabled to transmit both pitch and loudness. Thus regared, I consider the invention an important one, and as accomplishing a material advance in the art, as compared with telephones before known, which could certainly transmit pitch only. I do not find, for the reasons stated, in Bell's patent of March 7th, 1876, a speaking telephone, either directly or by inference from the language used, or from the drawings, and I have determined to my satisfaction, by actual test, that the specific apparatus which the Complainant has sought to prove is a speaking telephone, is wholly inoperative as such. As regards other forms of telephone, such as those depending upon variations of resistance for producing undulations in the current, I find no information in the specification or the drawing, which would enable a person skilled in the art at the date of said patent to make an operative device of that kind.

Q. 17. In Defendant's "Exhibit Bell Telephone 1876 Patent," as it appears here to-day on the table before us, the little metal studs that connect the hinged armatures to the centres of the diaphragms, have become loose or disconnected from the diaphragms. How were they at the time of your described experiments?

A. They were attached to the diaphragms by cement, some of which is still visible. I will state here, that during the progress of manufacture of the instruments, the workman asked me for information as to how to fasten those studs and diaphragms together. I told him he would have to get that out of the patent, whereupon he informed me that he couldn't find it there. I instructed him, nevertheless, to go on and do the best he could with the information he did find in the patent; and the result of it was his sending me the instruments with the studs shouldered upon the diaphragm and fastened thereto with cement. This attachment kept the parts together while I was experimenting, but they seem to have become loosened and separated through handling since I used the apparatus. They have been subjected to no rough usage, to my knowledge.

Q. 18. Do you know of any particular in which the instruments, as you used them, differed from the instruments shown in figure 7 of the drawing of Bell's patent of March 7th, 1876, and described in the specification thereof?

A. There is a slight difference in one point, which I should have mentioned before. During the progress of manufacture, the workman inquired of me how the uncovered leg of the magnet was to be fastened to the cone; and he called my attention to the fact that there is nothing in the patent explaining this, which is true. Then I told him to use his judgment in the matter, and the consequence of that instruction was, the attachment of the magnet to the cone by the piece of brass and two screws, as appears in the instrument. This extra piece of brass, with its screws, is not shown in the patent, and in my opinion is an immaterial variation from what is shown in the drawing, figure 7, so far as the actual operation of the telephone may be affected by it. This is the only difference, that I am aware of, between the two instruments produced and what is shown in figure 7 of the drawing attached to Bell's patent.

Q. 19. In making your experiments with these instruments, as you have described, did you omit any precaution or condition necessary to fully and fairly determine their operative efficiency for transmitting and receiving articulate speech?

A. No, not that I am aware of.

Q. 20. You have analyzed the Bell patent of March 7th, 1876, No. 174,465 and have given us your opinion of that patent, and of the instruments therein described, and your reasons for differing from Professor Cross in regard to the invention contained in that patent; will you now please examine the letters patent granted to Alexander Graham Bell, January 30th, 1877, No. 186,787, and the statements of the inventor, contained in the specifications thereof, and state how, if at all, your conclusions are affected thereby, giving your reasons in full ?

Adjourned until March 9th, 1882, at 10:30 A. M.

March 9th, 1882, 10:30 A. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Examination of Mr. Park Benjamin by Mr. Hill continued.

A. I have examined, and I believe I understand, Bell's Letters Patent referred to in the question. I have carefully considered the statements therein set forth, which so far as they affect the opinions I have already expressed, tend to confirm me in such opinions, and this is for the following reasons:

In the specification of his patent of January 30th, 1877, and before entering upon a description of the devices therein set forth, Professor Bell reviews some of his previous patents, and among them his patent of March 7th, 1876, which formed the subject of my preceding answer. In this patent of March 7th, 1876, he says: "I have shown and described a method of an apparatus for producing musical tones by the action of undulatory currents of electricity, whereby a number of telegraphic signals can be sent simultaneously over the same circuit, in either or both directions, and a single battery be used for the whole circuit;" and then, referring generally to all the patents, which he mentions, including the patent of March 7th, 1876, he goes on to say: "In the applications and patents above referred to, signals are transmitted simultaneously along a single wire by the employment of transmitting instruments, each of which occasions a succession of electrical impulses differing in rate from the others, and are received without confusion by means of receiving instruments, each tuned to a pitch at which it will be put in vibration to produce its fundamental note by one only of the transmitting instruments. A separate instrument is therefore employed for every pitch, each instrument being capable of transmitting or receiving but a single note, and thus as many separate instruments are required as there are messages or musical notes to be transmitted." Also in reference to his patent of March 7th, 1876, Professor Bell, in his specification before me, states that he has shown therein "as one form of transmitting instrument, a stretched membrane to which the armature of an electro-magnet is attached, whereby motion can be imparted to the armature by the human voice, or by means of a musical instrument, or by sounds produced in any way." The foregoing quotations are Professor Bell's own statements of what was contained in his patent of March, 1876, made nearly a year after the issue thereof. In them I find no reference to the capability of the apparatus described for transmitting articulate speech. I understand the concluding words of the last quoted paragraph simply to refer to the means whereby sound may be produced, and not to the particular kind of sound and manner of its production. I think the statements quoted correctly summarize what was set forth in Bell's patent of March 7th, 1876, and that they obviously accord with the opinion I have expressed, to the effect that that patent describes only a harmonic musical telephone, single or multiple, and not a telephone for transmitting articulate speech.

Inferentially, I find further confirmation of this view in Professor Bell's statements in his specification of January 30th, 1877, as to the object of the invention therein set forth; in which statements he particularly mentions that the object of the device described in said patent is the electrical transmission of articulate speech; and this he sets forth fully and clearly. My inference is, that, if that important feature was included in his earlier patent, he could just as fully and clearly have mentioned it there; and also, that by not so mentioning in that patent, and by fully doing so in his later one, he gives it to be understood that the invention was originally and for the first time described to the public, in a patent, in that which he obtained on January 30th, 1877.

In considering more particularly the claims of Bell's patent of January 30th, 1877, in comparison with what is set forth in the earlier patent of 1876, the making of which comparison I understand to be called for by the question asked me, and in attempting to reconcile the statements in the latter patent with those in the earlier one, as interpreted by Professor Cross, I am led into a sort of dilemma.

THE FIRST CLAIM of the patent of January 30th, 1877, recites: "The union upon and by means of an electric circuit of two or more instruments, constructed for operation substantially as herein shown and described, so that if motion of any kind or form be produced in any way in the armature of any one of the said instruments, the armatures of all the other instruments upon the same circuit will be moved in like manner and form, and if such motion be produced in the former by sound, like sound will be produced by the motion of the latter." As I understand Professor Cross' testimony in answer to interrogatories 11 and 12, Complainant's *prima facie* case, he finds in figure 7, of Bell's patent of March, 1876, an apparatus consisting of two instruments united upon and by means of an electric circuit, and so constructed that, if motion of any kind or form be produced in the armature of one of the instruments, the armature of the other instrument is caused to vibrate in correspondence therewith. Taking this view of the claim it follows that Professor Cross finds all that is therein set forth as already existing and patented in Bell's prior patent, in which case the claim recites no original invention existing in the later patent of January 30th, 1877. If this view is not correct, then I must understand that the words "two or more instruments" in the claim refer specifically to the instruments described in the specification, and that the claim is thus intended to be limited. The claim states that the specific instruments are constructed "for operation" substantially as shown and described, and the result of this operation is the transmission of articulate speech, and this taken into consideration with what I have already quoted from Professor Bell's statements in this patent, lead me to the conclusion that the claim refers to instruments having the capacity of transmitting articulate speech, which capacity is now for the first time set forth in this patent and not in any preceding one; that is to say, Professor Bell having apparently made the discovery, now for the first time specifically describes and claims operative means for carrying it into practice.

THE SECOND CLAIM of the patent of January 30th, 1877, has more particular reference to the production, in the armature of each receiving instrument, of any given motion by subjecting said armature to an attraction varying in intensity, however such variation may be produced in the magnet; this, in a system of electric telegraphy or telephony, consisting of transmitting and receiving instruments united upon an electric circuit. This is what is set forth in the first sentence of the claim, and it is difficult to see any substantial variation between what is thus recited and what is set forth in the first claim of the patent of March 7th, 1876, wherein is set forth "a system of telegraphy in which the receiver is set in vibration by the employment of undulatory currents of electricity, substantially as set forth," reference being had to my understanding of what is recited in that claim with regard to the state of the art, as I have already explained. A receiver in a system of telegraphy set in vibration by the employment of undulatory currents of electricity fairly, I think, includes a receiver in which an armature is set in motion by an attraction varying in intensity. The second sentence in the claim of Bell's patent of January 30th, 1877, amounts to a sort of explanation; for Professor Bell therein says, "Hence I claim the production of any given sound or sounds from the armature of the receiving instrument by subjecting said armature to an attraction varying in intensity in such manner as to throw the armature into that form of vibration that characterizes the given sound or sounds." The sum and substance of all this, it seems to me, is that Professor Bell, having restated substantially what he had claimed in his preceding patent, now claims for it the production of any given sound, which includes articulate speech. In this respect he seems to be at variance with Professor Cross again, for the latter witness substantially says that the apparatus described in the older patent would do all that Professor Bell now claims in the second part of the claim above quoted. If that is true, then Professor Bell is merely claiming here what he has already patented. If it is not true, then Professor Bell is now for the first time making an original claim for subject-matter not in the first patent. If the claim is to be understood as referring to the specific apparatus in the specification of January 30th, 1877, then I can find nothing in either of the patents to indicate to me that this was not the first apparatus patented by Professor Bell as a means or which was in fact an operative means of transmitting articulate speech. I am quite well aware that this answer is taking an argumentative form, and as such is open to criticism, but I have been asked to give my opinions, and the reasons affecting them, and I am giving the reasons in the form that they have presented themselves to my mind.

THE THIRD CLAIM recites the "combination, with an electro-magnet, of a plate of iron or steel, or other material capable of inductive action, which can be thrown into vibration by the movement of surrounding air, or by the attraction of a magnet." It seems to me that all this claim describes is already shown and described in the patent of March 7th, 1876, unless the particular form of plate shown in the patent of January 30th, 1877, be regarded as an essential element of the combination. The vibrating armature, shown in figure 5 of the earlier patent, which is made of material capable of inductive action, is a thin plate, and is in combination with an electro-magnet, and the specification clearly states that it may be set in motion by the wind, which is a movement of the surrounding air, or, when used on the receiver, by the attraction of a magnet.

LEPHONE COMPANY,-2

THE FOURTH CLAIM recites: "In combination with a plate and electro-magnet, as before claimed, the means herein described, or their machanical equivalents, of adjusting the relative position of the two so that, without touching, they may be set as closely together as possible." And the specification in this connection says that "it is important that the distance of the magnet from the plate should be as little as possible, without, however, being in contact." Now the information which Professor Bell here gives for the first time in a patent is not only of importance, but of very material importance, in the successful operation of a magneto-telephone. In order that any description of a speaking magneto-telephone may be one from which an operative device may be constructed, it must either set forth adjusting contrivances, whereby the distance between magnet and plate can be regulated, so that the user, if need be, can find out by experiment the proper distance between them to obtain the best results in the transmission of speech, or else it must include a drawing, or what would be much less practical, a statement showing or setting forth exactly what is the proper distance between magnet and diaphragm. In his patent of March 7th, 1876, Professor Bell says nothing on this subject. He gives a drawing showing armature and magnet separated normally by a certain distance. The only understanding possible is, that the distance which he shows them to be separated is the distance which he intends them to be separated. And, of course, it follows that when other distances and proportions of parts shown are increased or diminished, this distance must also be increased or diminished in like ratio.

Recess for lunch.

March 9, 1882, 2.30, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

[*Witness continues.*] But, as I have already shown, an apparatus made in conformity with what Professor Bell states and exhibits in his patent of March, 1876, figure 7, is inoperative as a speaking telephone; and there is no suggestion in that patent which would lead anyone, I think, to vary the distance between the armature and the magnet from the distance there shown, or giving him any notice that there would be any advantage in doing so; and, so far as I am acquainted with the state of the art prior to the date of Bell's patent of 1876, there was nothing there which would enable anyone skilled in it, from his knowledge thereof, to alter the distance between magnet and armature from that which Professor Bell shows, with the idea of achieving the result of transmitting articulate speech. I don't know of anything being made public in a patent, even in the interval between the issue of the two Bell patents under consideration, which would lead a person who had made the apparatus shown in figure 7, of the patent of 1876, and finding it to be an inoperative one, as I did, to alter its construction or to combine with it any apparatus for adjusting this distance. And in short, Professor Bell seems to have practically kept this very important information, bearing upon the subject of making an operative speaking telephone, from the world, until his patent of January 30th, 1877, referred to before.

THE FIFTH, SIXTH, SEVENTH and EIGHTH CLAIMS of Bell's patent of January 30th, 1877, I understand to relate to combinations in the specific apparatus set forth. In "Defendant's Exhibit Wheatstone Telegraph" there is clearly shown a magnet with a coil upon the end nearest the armature, and also a permanent magnet so arranged substantially as recited in the fifth and eighth claims. And if the first three claims of the patent of 1876 relate, as Professor Cross seems to think, to a system of electric telephony, the old Wheatstone apparatus contains these elements under like condition, though not in the specific system of electric telephony particularly set forth in Bell's second patent and referred to in the fifth and eighth claims.

THE SIXTH and SEVENTH CLAIMS of Bell's patent of January 30th, 1877, relate to the sounding-box and the speaking-tube, both of which devices, in almost identically the same form and for the same purpose, were used in the Reis telephone, and are represented clearly in the engravings published in the issue of the *Manufacturer and Builder* referred to, in 1869. Generally, therefore, so far as the subject-matter of the fifth, sixth, seventh and eighth claims of Bell's patent of January 30th, 1877, is concerned, I think Mr. Bell simply recites a combination of old devices in and with the operative telephonic contrivance which he describes.

Q. 21. In your several answers above, you have spoken of the state of the art at the date of Bell's patent of March 7th, 1876, and at the date of his patent of January 30th, 1877. In so referring to the state of the art have you taken into consideration anything that had been done by Mr. Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania, or have you, on the other hand, made your answers without reference to what Mr. Drawbaugh had done?

A. I have not taken into consideration anything done by Mr. Drawbaugh. I understood the questions to limit me to what I knew of the state of the art at the time of the dates of Bell's patents of March 7th, 1876, and January 30th, 1877, and the only substantial departure that I have made from this is in considering "Defendant's Exhibit Wheatstone Telegraph," which, as I before stated, was brought to my notice at quite a recent date.

Q. 22. Without taking into consideration anything done by Mr. Drawbaugh, will you briefly summarize in one answer what you understand from Mr. Bell's two patents aforesaid, to have been the improvement, or advance in the art, contained in the invention patented March 7th, 1876; and also what you understand to have been the further improvement, or advance in the art contained in the invention patented January 30th, 1877, and in the same answer please state how your present opinion of the first named invention of Mr. Bell, as derived from careful examination of his patent of March 7th, 1876, compares with the understanding which you say you had of that invention, when it was first communicated to the public in 1876?

A. In his patent of March 7th, 1876, I understand that Mr. Bell takes the old undulatory current, well known in telegraphic systems, and produced therein in substantially the same way as he produces it, and applies it to a telephonic system, whereby the signals transmitted are received by sound. Before him, the signals transmitted by the undulatory current had been received in apparatus, the indications of which were addressed primarily to the eye, though secondarily they have also been received by sound; through, for example strokes on a bell. There had arisen, however, what might be considered, perhaps, a new art, in the transmissions of the normal vibrations of a body, so as to affect and set in vibration another body tuned in unison therewith, through the medium of an intermittent, or "make-and-break" electric current. Substantially, to what was known in this new art Professor Bell applied what I have already pointed out as existing in the old art, and the result of this union was an advance in the new art, in the shape of the invention of a telephonic system, whereby both pitch and loudness of sound would be transmitted, and this either in single or multiple form. That was the advance made in the first patent. In the second patent of January 30th, 1877, he makes two advances: the first being the transmission simultaneously of two or more musical notes, or signals along a single wire and with a single battery, without the use of as many instruments as there are musical notes, or signals to be transmitted; and second, and what was infinitely more important to the world, he takes the elements of the harmonic musical telephone, which he had previously invented, and adds to them other things—other instrumentalities, some old and some new—and as a result then, and only then, achieves the production of a telephone competent to transmit articulate speech. This sums up the advance made in the second patent. Now, as regards the second part of the question, as to my impression at, or about, the time Bell's patent of March 7th, 1876, was issued, and in fact for some months afterwards, I think I have already stated somewhere in my testimony, that I supposed it to be simply a harmonic musical telephone. Although it may not be proper for me to say so, I think this was the general impression among those who controlled the editorial columns of the *Scientific American*; and at all events it is certain, that if I had supposed Mr. Bell's invention and his patent of March 7th, 1876, did then embody the extraordinary advance Professor Cross says it did, then I should have regarded it as my duty, if I had seen that the proprietors of the *Scientific American* did not so understand it, to have urged the scientific importance of the matter upon them, or taken other means looking to its early and full publication in the paper. As it was, I think no detailed reference to the subject was made in the paper until the following September (1876), and when this article did appear it was headed with a reference to, and the instrument described was compared with, a string-telephone, or thread-telegraph as it was called, published in the interval, on May 27th, 1876. This article was not published in a prominent part of the paper, and on looking it over now, my impression is that it was derived, in substance, from another journal.

Q. 23. In his patent of January 30th, 1877, Professor Bell states in effect, that he had invented also an improvement consisting substantially in means for dispensing with the necessity for a voltaic battery in this class of instruments. I observe that in your last answer you did not refer to this last statement; why not?

A. I omitted reference to that point advisedly, because Professor Bell got, or could easily have got, the idea of doing away with the battery from the state of the art of telegraphy, as known before the date of his patent of January 30th, 1877. In "Defendant's Exhibit Wheat-

LEPHONE COMPANY,-2

stone Telegraph" is shown clearly the method of obtaining magneto-electric undulatory currents in a system of telegraphy, without the use of a battery, and with the use of permanent magnets; and the description in that exhibit expressly points out that this substitution is made. It will be noticed further, on comparing figure 1, of the drawings attached to "Defendant's Exhibit Wheatstone Telegraph," with the drawing, figure 5, of Bell's patent of January 30th, 1877, that the devices respectively shown therein, so far as magnet, coils and cores, and armature are concerned, is substantially and almost exactly the same; and the use of the magnet in the one case, so far as the production of an undulatory current is involved, serves the same purpose as in the other. The substitution of the magnet for the battery, therefore, I meant to include in my previous answer among the old ideas of which Mr. Bell availed himself in getting up the device shown in his patent of January 30th, 1877.

Q. 24. You have observed that Professor Wheatstone, in the exhibit to which you have referred, arranges the permanent magnet and the electro-magnets at right angles to each other, whereas Professor Bell arranges them in the same plane; what difference, if any, does this make?

A. None, I think, that is material; numerous working speaking telephones have since been made with the coils arranged at right angles to, and also as prolongations of, the permanent magnet, the instruments operating well, so far as I know, in either way.

Q. 25. Please compare the telephone transmitter patented by F. A. Klemm, December 21st, 1880, No. 235,635, which patent is for one of the alleged infringing instruments, with the two patents of Professor Bell, here in suit, and state whether or not you agree with Professor Cross, on the infringement questions involved in the use of said Klemm battery transmitter, giving your reasons for any opinion you may express.

[*Counsel for Complainants calls attention to the fact that the two instruments put in evidence as infringing instruments, were called, on page* 20 *of Complainant's record, the one " Complainant's Exhibit Klemm Battery Telephone," being a battery transmitter of the form and character shown in the drawing and description of the Klemm patent* 235,635, *printed on page* 83 *of the Complainant's record; and the other " Complainant's Exhibit Tisdel Magneto Telephone," being an instrument the same in general* *principle as that shown in the Tisdel patent* 227,861, *page* 84, *of Complainant's printed record, but differing somewhat from the one there figured, in the form of some of the parts, said differences not being material to this case as he understands. He also states that in questions* 20 *and* 24, *pages* 40 *and* 42 *of Complainant's case, the word* "*Klemm*" *there found should be* "*Tisdel,*" *the instrument referred to in said questions and answers thereto being the Tisdel Magneto Telephone.*]

Adjourned until March 10th, 1882, 10:30 A. M.

March 10th, 1882, 10:30, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Examination of Mr. Park Benjamin by Mr. Hill continued.

A. I agree with Professor Cross in finding in the battery transmitter an instrument which, when operated by the voice, will produce electrical undulations in the current traversing the circuit similar in form to the air waves by which these electrical variations are produced ; also with his statement that it operates by varying the resistance of the circuit. The means through which this result is chiefly attained consist of a metal diaphragm supported on a spring-arm, in contact with which there is held a carbon contact-piece supported by another spring-arm. The diaphragm is set in vibration by the voice, and thereby the pressure between said contact-piece and a point on the diaphragm is varied, thus producing changes in the resistance in an electrical circuit passing through said diaphragm and contact-piece.

While, as I have already stated, it was known theoretically, from Ohm's law, as recited by Professor Cross in his answer to the 13th interrogatory in Complainant's *prima facie* case, that the strength of a current could be varied by increasing or diminishing the resistance, and this long before the date of Bell's patent of March, 1876, still, so far as I am aware, no apparatus for producing undulatory currents by this means, especially in a telephonic system, had been devised or come into use. I understand from Professor Cross' testimony that he considers that Mr. Bell in his patent of March 7th, 1876, first indicates such an apparatus as embodying one of the methods devised by him as suitable for the production of electrical undulations similar in form to the air waves produced by the voice. Professor Cross also undertakes to show, in his answer to the 19th interrogatory in his testimony in Complainant's *prima facie* case, by various references to prior French publications, that it was "known long before the date of Mr. Bell's patent that the resistance of a circuit is varied, without being broken, by variations in the intimacy of contact, or amount of pressure between two electrodes in contact, from one to the other of which a current is passing." He describes, however, no specific construction of apparatus depending upon this principle for its operation, but, as I understand him, says generally that the fact was "constantly acted upon in the practical use of electrical apparatus; care was always taken that contact should be firm and with considerable pressure, for otherwise the full and desired strength of current was not obtained."

In view of this acknowledgment as to the state of the art by Professor Cross, indicating the principle to have been known, it seems to me all the more necessary for Professor Bell, if he intended to apply that principle to a telephonic apparatus, to specifically describe his means for doing so; otherwise, according to Professor Cross' own admission, it is scarcely possible to see how he has made any invention or discovery in this direction at all.

But I have already pointed out in a preceding answer, in considering Professor Bell's patent of March 7th, 1876, that he wholly fails to give therein any information from which an operative apparatus of the kind could be constructed.

Professor Cross admits, page 37, that "the precise method adopted in the Klemm transmitter for varying the resistance of the circuit is different from the particular method referred to by Mr. Bell, inasmuch as it utilizes the property of variation in resistance with variation in pressure possessed by various substances." I infer from this, that Professor Cross must attach some meaning to the words "particular method" different from the general run of humanity; because the nearest approach which Mr. Bell makes to particularity in this connection is found in the following sentence: "For instance, let mercury or some other liquid form part of a voltaic circuit, then the more deeply the conducting wire is immersed in the mercury or other liquid, the less resistance does the liquid offer to the passage of the current; hence the vibration of the conducting wire in mercury or other liquid included in the circuit occasions undulations in the current." Certainly, I think, these words do not describe a "particular method" and the specific construction and means whereby it can be carried out, and, unless Professor Cross intends the term "precise method" to mean one thing and "particular method" to mean another, in the sentence I have quoted from his testimony, I fail to see how he can regard as comparable the specific and detailed statements of the Klemm patent, and the vague suggestion made by Professor Bell, as before quoted.

But apart from all this, even after making this comparison, he says the two methods differ; so that if the meaning of his testimony is that he finds in the Klemm transmitter substantially the same elements operating in like manner to produce a like result, as recited in Bell's patent of March 7th, 1876, then I fail to see how he determines this other than by a comparison between the detailed statements of the Klemm patent and Professor Bell's bald statement that electrical undulations may be produced by varying the resistance of the circuit. So that all the conclusion I can derive from his testimony on this point is, substantially, that the Klemm transmitter contains a principle set forth in Bell's patent, but its method of apylying this principle of varying resistance is different from even the mere hint of a method that Professor Bell gives, and that he is able, virtually, to swear that Klemm infringes Bell by comparing what is fully described in Klemm's patent with Bell's statement, that by alternately increasing and diminishing the resistance of a circuit you can produce electrical undulations therein

In comparing the Klemm transmitter with what is set forth in Bell's patent of January 30th, 1877, the substance of Professor Cross' testimony appears to be simply that he finds in the Klemm battery transmitter that the diaphragm is protected from the action of extraneous sounds by a box substantially like that described in the Bell patent, and also that he finds in the Klemm transmitter the reduced orifice which admits sound waves to the plate directly at its centre, and the reduced space in front of the plate, as shown in Bell's patent aforesaid. I don't find any reference to these features in the specification. They are shown in the drawings; that is to say, in the drawings attached to the patent, the diaphragm appears to be protected from extraneous sounds by a box, and there is a narrow space between the end of the speaking tube and the diaphragm, which I presume to be the reduced space referred to.

THE SIXTH CLAIM of the patent simply recites: "The combination with an electric telephone such as described of a sounding-box, substantially as herein shown and set forth."

So far as the essential construction and operation of the Klemm transmitter is concerned, by varying the resistance of the circuit, Mr. Bell makes no reference to an instrument of that kind specifically in the second patent of January 30th, 1877, and I do not understand Professor Cross to say that he does.

Q. 26. Have you examined the various instruments put in evidence by the Defendants in this cause as the inventions of Daniel Drawbaugh, of Eberly's Mills, Pennsylvania, and do you understand their construction and mode of operation?

A. I have carefully examined the instruments named in the question, and believe I understand their construction and operation.

Q. 27. Have you tested the practical operation of any of them, by actually working them on a voltaic or magneto-electric circuit, or circuits?

A. I have.

Q. 28. Have you heard or read Mr. Drawbaugh's testimony in this cause relative to said instruments, his mode of working them, and the modifications of some of the earlier ones to which he refers?

A. I heard Mr. Drawbaugh give nearly the whole of his testimony; all, I think, that bears directly upon the instruments themselves.

Q. 29. Assuming Professor Cross' opinions as to the patents of Alexander Graham Bell and the inventions therein contained to be correct, will you please compare the Drawbaugh instruments here in evidence, marked "F" and "B," with the two Bell patents on which this suit is founded, referring, if you please, to the original and "reproduced" instruments "F" and "B," and to the drawings and photo-lithographs thereof, as you find them here in evidence, and to Mr. Drawbaugh's description of said instruments and their modifications, which you will find in his deposition in this cause; and state whether or not, and, if yes, to what extent, you find those instruments, or either of them, to contain the same invention as said Bell patents, or either of them, giving your reasons, so far as you may think necessary, for any opinions you may express, and referring to any tests which you may have made?

Recess for lunch.

March 10*th*, 1882, 2 P. M.

Examination resumed pursuant to adjournment.

Present, Mr. Storrow for Complainants, and Mr. Hill for Respondents.

Examination of Mr. Park Benjamin by Mr. Hill continued.

Ans. I understand that in answering this question I am to adopt fully and completely, and assume to be correct, without regard to opinions I have hitherto expressed, the statements which Professor Cross makes as to what he finds set forth in the patents of Professor Bell in suit. In view of the full descriptions which have already been given of Mr. Drawbaugh's instruments "B" and "F," by Mr. Drawbaugh himself and Mr. Knight, in their testimony in this case, which descriptions I have read and believed to be correct, I do not think it necessary for me in the present connection to repeat the same, so that I shall pass at once to the comparison called for between the two instruments and what Professor Cross finds set forth in the Bell patents.

I will first compare the instrument "B," as shown in Defendant's "Exhibit B reproduced drawing," with the instrument shown in figure 7, and described in the specification of Bell's patent of March 7th, 1876.

In figure 7 there is shown an electro-magnet the coil of which may be connected with a voltaic circuit. In Defendant's "Exhibit B" there is an electro-magnet the coils of which may be connected with a voltaic circuit. In front of the pole of the electro-magnet in Bell's device, figure 7, is arranged an armature of inductive material, by the vibration of which undulatory currents may be induced in the coils of the electro-magnet. In Defendant's "Exhibit B" there is arranged before the poles of the electro-magnet an armature, by the vibration of which undulatory currents may be induced in the coils of the electro-magnet. In both the instrument "B" and Bell's instrument the armature is connected to a membrane, in such manner as to receive and be governed by the movements of that membrane. In both instrument "B" and Bell's device, the membrane is stretched across the end of a tube, the purpose of which in both cases is to receive and concentrate sound made into it upon said membrane. In the instrument "B" the armature is secured directly to the membrane, and facing the poles of the electro-magnet. In Bell's device, figure 7, the armature is hinged to one leg of the magnet and hangs down in front of the pole, and is connected to the membrane by a stud. For purposes of this comparison, I regard this difference in mode of connection as immaterial, though as a matter of fact, for practical purposes, I consider the method shown in instrument "B" as the better one. There is shown in Defendant's "Exhibit B" a tension-spring for tightening the diaphragm, which is not shown in Bell's figure 7, but the spring is merely additional, and does not alter in principle the construction and operation of the device. I have now found in Defendant's instrument "B" all the essential elements set forth in the two similar instruments exhibited connected by a closed voltaic circuit, in figure 7 of Bell's patent of March 7th, 1876; and I also consider, that if two instruments "B" were connected in a like manner by a closed voltaic circuit, then the said instruments "B," being substantially the same in construction, would be the same in arrangement in the circuit, and hence would operate in substantially the same way to produce the same results, namely, the transmission of articulate speech, as asserted by Professor Cross in reference to figure 7 of Bell's patent of March 7th, 1876. From the testimony which has been given in this case on the part of the Defendants, I learn that Defendant's instrument "B" was intended for and used as a receiver; and I further find by comparing the essential elements existing in said instrument "B," with what is shown and set forth in the receiver in figure 7 of Bell's patent of March 7th, 1876, that an undulatory current passing into the electro-magnet of said instrument "B" would influence the armature attached to the membrane, and cause it to vibrate correspondingly—this in the same manner, and producing the same result as the electro-magnet in the receiver in Bell's apparatus in figure 7 influences and causes to vibrate the armature combined with it. If, then, the receiver in Bell's device is competent to reproduce articulate speech, Defendant's instrument "B" is equally competent to do the same thing, both being operated in the same manner by the undulatory current.

In order to discover whether Defendant's instrument "B" would actually reproduce articulate speech, I tested the "reproduced" instrument "B" on a closed voltaic circuit. As I shall have other tests to describe in future answers, it seems proper at the outset to take occasion here to describe the conditions under which these tests were made, and also the general manner of making them.

A line-wire was run from the small corner room of the upper story of Mr. Drawbaugh's shop, at Eberly's Mills, through and across the building, then out of a window and into a room in an out-house adjoining, twenty-five or thirty feet distant from the shop. The distance from end to end of the circuit was some sixty or seventy feet. I used the room in the shed as a receiving station chiefly, and when the door of that room was shut it was wholly impossible to hear any sound whatever coming through the air from the upper story of the shop. In all cases hereafter mentioned I took the same precautions, which I have already mentioned in a previous answer, against an instrument being taken off the line and another substituted without my knowledge, while I was at the other end of the circuit, in the way of twisting the connections together in a particular manner known only to myself. I also took the further precaution of stationing a reliable man, whom I am informed is in no wise interested in this cause, to watch the instruments after I had attached them, during my absence. The person I refer to is Mr. Heiges, who has already testified in relation to this subject. I think I may say that I omitted no precaution that I could think of to make these tests absolutely fair, and to prevent any possible improper tampering with the instruments while they were under my control. Instrument "B" was tested first on the circuit described; this was on December 1st, 1881; and again on the same circuit on which the Bell instruments that I had made were tested, as described in my previous answer, on December 14th, 1881. In both cases the "reproduced" instrument "B" was used, as a receiver, the circuit being closed through a battery and carbon transmitter. I listened at the instrument "B," after personally examining the circuit, and testing it to be sure that it was in good working order, by means of the two Tisdel speaking telephones, as already described in a previous answer; I also attached the instrument "B" and the transmitter. Under these conditions I heard speech through the instrument "B," so as to distinguish what was said by the person at the other end of the line, who talked into the transmitter. I had various kinds of noises made into the transmitter, including music from a musical-box, ticking of a clock, and counting and repetition of sentences by the human voice; and I found no difficulty in recognizing the different qualities of these sounds.

As regards the instrument "F," this is constructed on the principle of using the undulating current by varying the resistance of the circuit, and hence belongs to the same class of instruments as the Klemm transmitter, one of the alleged infringing devices in this case. For reasons I have already given it is not possible for me to go into any detailed comparison between this contrivance and what is set forth in Bell's patent of March 7th, 1876. I can only compare it with what Professor Cross says he finds claimed in and substantially covered by that patent, namely: any apparatus for producing an undulatory current in a telephonic system through varying the resistance of the circuit. Defendant's instrument "F" is such an instrument. Speech or sounds uttered in front of the diaphragm cause the same to vibrate and transmit its movements by a rigid connection to a metallic plate resting upon powdered carbon, held in a suitable cup. A circuit is made through the diaphragm and carbon, and the vibrations of the diaphragm cause the carbon to be subjected to varying degrees of pressure, which vary the resistance of the material to the passage of the current, so rendering the latter undulatory. I understand, that this instrument was intended and made for a transmitter, and of course its form renders it unsuitable for use otherwise. In this respect it is analogous to the Klemm transmitter, and it operates on the same principle to produce like results. I tested this instrument in its reproduced form ("Defendant's Exhibit reproduced" "F") in both of the circuits previously described, on November 30th and December 14th, 1881, using a magneto instrument as a receiver. I found no difficulty in hearing spoken words under these conditions. The battery current, both in this and the preceding test, was obtained from a Leclanché cell in the circuit. The magneto instruments which I used as receivers, and through which I heard speech, were Defendant's "reproduced" "B," already referred to in this answer, and Defendant's original instrument "A." Although under these conditions the sounds received through the "reproduced" instrument "B" were readily recognized and distinguished by me, those received through the original instrument "A" were louder and clearer.

Q. 30. Please answer the same question with the words "C" and "I" substituted for "F" and "B;" that is to say, make the same comparison between the Drawbaugh instruments "C" and "I," and the Bell patents aforesaid.

Ans. The construction of these instruments, I believe, has been fully described by Mr. Drawbaugh and Mr. Knight in their testimony in this case. In instrument "C" (and for the purpose of this comparison I refer more particularly to Defendant's "Exhibit C reproduced," and also Defendant's "Exhibit reproduced C drawing,") I find contained all the essential elements set forth in Bell's patent of March 7th, 1876, as interpreted by Professor Cross, capable of operating in like manner to produce the same results; this for the following reasons:

In both Bell's device, as more particularly shown in figure 7, of the patent referred to, and Defendant's exhibit "reproduced" instrument

"C" I find an electro-magnet having arranged in front of its pole an armature which, when set in vibration, will cause undulatory currents of electricity in the coil of said magnet, which currents will pass into a circuit wire, if the same be suitably connected with said coil, and will affect the magnet, and, hence, the armature of a similar instrument connected in said circuit, so that the second armature may reproduce the vibrations of the first.

I also find in both Bell's device, in figure 7 of his patent of March 7th, 1876, and in Defendant's exhibit "C reproduced," a tube for concentrating the sound-waves upon the armature. I find further, that, although Defendant's "reproduced" instrument "C" was not intended for working with a battery in circuit, still it may be so worked and two instruments "C" may be joined, and arranged in circuit with a battery, as are the instruments shown in Bell's patent of March 7th, 1876. The two instruments "C," when thus arranged, would, in my opinion, operate in like manner to produce the same result as Professor Cross considers true of the apparatus shown in figure 7 of Bell's patent of March 7th, 1876.

I find also in Defendant's exhibit "C reproduced" many of the most essential features embodied and described in Bell's patent of January 30th, 1877, for the reason that said instrument "C" contains an electro-magnet combined in substantially the same way and for the same purpose, with a plate of iron or other material capable of inductive action, which can be thrown into vibration by the movement of the surrounding air, or by the attraction of a magnet. There is attached to this plate an armature of like material, and in the original instrument "C" I understand the plate to be of German silver, and the armature of iron. I do not regard these differences as material, as between the two instruments "C," original and "reproduced," nor do I regard the presence of the armature as material, as affecting the comparison already made between Defendant's instrument "C" and the subject-matter of the third claim of Bell's patent of January 30th, 1877. The magnet in Defendant's Exhibit instrument "reproduced" "C" serves the same purpose and accomplishes the same results chiefly in obviating the use of a battery in the circuit, as does the permanent magnet shown in Bell's device of January 30th, 1877.

I tested Defendant's instrument "C reproduced" on the circuit between Mr. Drawbaugh's shop and shed, on November 30th, 1881. No battery was joined with the circuit, and the wires were connected by me to "reproduced" instrument "C" at one end and another magneto-telephone at the other. I tested instrument "reproduced" "C" both as atransmitter and receiver, and in both cases heard speech through the line distinctly. I found it to be especially good as a transmitter, and I noted that the sounds received by me while listening at "C" were not so loud or distinct as those which I heard while listening at the telephone at the other end of the line, the instrument "reproduced" "C" being used as a transmitter.

Adjourned until March 11th, 1882, at half-past ten, A. M.

March 11th, 1882, 10.30, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Mr. Park Benjamin by Mr. Hill continued.

[*Witness resumes answer.*] Comparing now Defendant's exhibit "reproduced" instrument "I" and Defendant's "Exhibit reproduced I drawing" with what Professor Cross finds shown and described in Bell's patent of March 7th, 1876, I find both in said "reproduced" instrument "I" and in the apparatus shown in Bell's patent substantially the same essential elements operating in like manner to produce the same result, for the following reasons:

In both devices there is an electro-magnet before the pole of which is arranged an armature, through the vibrations of which undulatory currents may be induced in the coils of said magnets, and which armature may also be set in vibration by undulatory currents, when the same are passed through said coils. In both devices the armature is attached to and its movements may be governed and controlled by vibrations imparted to a diaphragm extended across the end of a tube, which tube serves in both devices as a means of concentrating the sound upon the diaphragm. Although so constructed as to be capable of being used without a battery, two instruments "I," of like construction, may be joined and will operate in a closed voltaic circuit to produce the same results as Professor Cross states may be produced by the two instruments represented in figure 7 of Bell's patent of March, 1876, when said instruments are connected in a closed voltaic circuit, as shown. I also find in Defendant's "Exhibit reproduced I drawing," many of the essential elements set forth in Bell's patent of January 30th, 1877, operating to produce a like result in substantially the same way, for the following reasons:

Both the apparatus described in said patent and Defendant's Exhibit "reproduced" "I" instrument contain an electro-magnet combined with a plate of material capable of inductive action, which can be thrown into vibration by the movement of the surrounding air, or by the attraction of a magnet. Both instruments are electric telephones, in which is arranged a magnet with a coil upon the end of the magnet nearest the plate. Both instruments are provided with a sounding-box, in which the diaphragm is inclosed and which protects said diaphragm from being affected by extraneous vibration, and in both there is a comparatively reduced space in front of the diaphragm and a central small opening in the mouth-piece; and in both instruments there exists the combination of a permanent magnet with a plate of material capable of inductive action, with coils upon the end of said magnet nearest the plate; the presence of the magnet in both cases enables the instruments to be used without a battery. I also find both in Defendant's "reproduced" instrument "I" and in Bell's device as set forth in his patent of January, 1877, when either of said devices are united upon an electric circuit in the form of receiving or transmitting instruments, any given motion may be produced in the armature of each receiving instrument by subjecting each armature to an attraction varying in intensity, substantially as set forth in the second claim of Bell's patent of January 30th, 1877. I have tested Defendant's Exhibit "reproduced" "I" under the same conditions, and in the same place as already referred to in previous descriptions of tests, on November 30th, 1881.

Defendant's Exhibit "reproduced" instrument "C" was attached to one end of the line, and Defendant's "Exhibit I reproduced" instrument to the other by me, no battery being used in the circuit. I listened at instrument "I" and clearly heard speech passing through the line. I also listened at the instrument at the other end of the line, and there I heard speech uttered into instrument "I."

Q. 31. In the same manner please compare said two Bell patents with Drawbaugh's instrument here in evidence, marked "A."

A. This instrument has also been fully described by Mr. Drawbaugh and Mr. Knight, in their testimony in this case. In comparing Defendant's Exhibit instrument "A," with what Professor Cross states is shown and set forth in Bell's patent of March 7th, 1876, I find in both devices substantially the same essential elements, operating in like manner to produce the same results, for the following reasons: In both devices there is an electro-magnet, before the pole of which is arranged an armature of inductive material, by the vibrations of which undulatory currents may be induced in the coils of the electro-magnet, or which may be caused to vibrate by undulatory currents passing into said coils; and I understand that the said instrument "A," was originally intended to be used as a receiver in a telephonic circuit with a battery; and I find that when so used it will operate in substantially the same way, to produce a like result as the device shown at L, in figure 7, of Bell's patent of March 7th, 1876 In both devices the armature is connected to a diaphragm, and communicates thereto the motion caused by the influence of the magnet upon it; and in both instruments there is a compartment in front of the diaphragm for concentrating the sounds emitted thereby upon the ear.

I also find in Defendant's Exhibit instrument "A," a sounding-box inclosing the diaphragm and protecting the same from extraneous vibrations, and so arranged that a much reduced space is formed in front of said diaphragm; and there is also a hearing-tube for conveying the sounds from the telephone; all substantially as set forth in Bell's patent of January 30th, 1877. I also find in Defendant's "Exhibit A," in combination with the armature and electro-magnet, specific means for adjusting the relative position of the two, so that without touching they may be set as closely together as possible; substantially as recited in Bell's patent of January 30th, 1877.

I tested this instrument "A," at the same place, and under the same general conditions, as set forth in my descriptions of previous tests, on November 29th, and November 30th, 1881. I used the instrument as a receiver, attaching a carbon transmitter to the other end of the line, and connecting a battery in the circuit. In one of the tests the carbon transmitter used was Defendant's Exhibit "reproduced" "F." I listened at instrument "A," and heard speech passing through the line clearly and distinctly. I caused several persons to speak into the transmitter, and found no difficulty, not only in hearing what they said, but in recognizing the persons speaking by their voices

Perhaps it may be proper for me to state here that this instrument "A" was the first one given to me to test of any of Mr. Drawbaugh's instruments. I had never seen any of these instruments before the day these tests were begun, and I knew nothing whatever as to their capability, except what had been told me. I looked, of course, at the construction of instrument "A" before connecting it to the line, and recognized at once its similarity to Mr. Bell's alleged invention, about as I have indicated. I had quite a clear recollection, and have now, of the results which I obtained from the two early Bell magneto-telephones, which I tested in 1877, I think, as I have described in a previous answer; so that I could form some idea of the relative efficiency of this instrument "A" of Mr. Drawbaugh's and that of Mr. Bell's instrument by a mental comparison. In my opinion the speech that I received through Drawbaugh's instrument "A" was considerably louder and clearer than any which I had heard through Bell's old telephone. I understood, then, that the instrument "A" had been constructed nearly eight years ago, and I naturally inferred from this fact that age and wear might have caused some deterioration in its condition, which would reduce its efficiency; and this, perhaps, accounts for the surprise which I felt on hearing speech so clearly and distinctly delivered by it, especially in comparison to what I had heard from the Bell instruments before referred to, which appeared to be quite new at the time I used them.

Q. 32. Were Bell instruments, which you tested in 1877, constructed in accordance with his patent of March 7th, 1876, or with that of January 30th, 1877?

A. They were not constructed in accordance with his patent of March 7th, 1876, but were constructed in substantial accordance with his patent of January 30th, 1877, with some modifications in form; that is, they were not box instruments, as shown in said patent, but were of the so-called "butter-stamp" form, like the Bell magneto-instruments now in common use.

Q. 33. From your knowledge of the construction and working of Drawbaugh's instrument "A," which you tested as described, and from your knowledge of the two Bell patents herein above referred to, and of the practical operation of electric speaking telephones in general, assume a voltaic circuit such as described in Bell's patent of March 7th, 1876, with one of Drawbaugh's instruments "A" substituted in the line in place of the transmitter shown in figure 7 of the Bell patent of March 7th, 1876; and another instrument exactly the same as "A" substituted in the line in place of the receiver shown in said figure 7; and then state how the line thus equipped would, in your judgment, compare with the line and its equipments shown in said figure 7.

A. I have already pointed out and demonstrated, I think, by actual test that the apparatus shown by Professor Bell, in figure 7 of his patent of March 7th, 1876, is inoperative for the transmission of articulate speech. I have also found in Drawbaugh's instrument "A" all the essential elements set forth and shown in the apparatus set forth and shown in said figure 7; and, assuming Professor Cross' statements with regard to that apparatus to be correct, it follows that if said apparatus is operative, then two of Drawbaugh's instruments "A" connected in closed circuit with a battery in the same way would also be an operative speaking telephonic device. But throwing aside this assumption and comparing two of Drawbaugh's instruments "A" connected in closed circuit with a battery with actually what is shown in said figure 7, I find that Drawbaugh's instruments thus arranged would constitute an operative system for transmitting articulate speech, although Bell's device would not, chiefly for the reason that there are embodied and present in Drawbaugh's instruments "A" important improvements wholly absent from the device shown by Bell in his patent of March, 1876, figure 7, and not described by Bell in a patent until in the one which he obtained January 30th, 1877. Of these improvements, as I have already pointed out, the most important is the means for adjusting diaphragm and armature with relation to each other as closely together as possible without touching, as Bell describes in the fourth claim of his patent of January 30th, 1877. In Drawbaugh's instrument "A" two devices for this purpose are provided, whereby this adjustment may be effected with great nicety, there being not only an adjusting-screw, marked *G*, in Defendant's "Exhibit A drawing," for bringing the electro-magnet closer to or farther from the diaphragm, but also a second adjusting-screw, marked *B*, in said drawing, by which the diaphragm may be adjusted closer to or farther from the pole of the magnet. In testing this instrument "A" I used these screws for effecting the adjustment, and found them to serve the purposes described excellently well.

Q. 34. In testing the instrument "A," if I understand you correctly, you did not use a reproduction of the instrument, but used the original instrument itself, which is here in evidence; am I right?

A. Yes, sir.

Q. 35. Assume a closed voltaic circuit, such as is shown in figure 7 of Bell's patent of March 7th, 1876, and in place of the transmitter and receiver shown in said figure 7, assume that two of Drawbaugh's instruments similar to Defendant's Exhibit "reproduced" "B," are substituted; then please compare the line thus equipped with the invention of Bell shown in figure 7 of his patent of March 7th, 1876, and with the invention shown in his patent of January 30th, 1877.

A. In one of my answers hitherto given, with regard to the construction that I found set forth in figure 7 of Bell's patent of March, 1876, I pointed out that not only was there no means shown nor suggested whereby the distance between magnet and armature could be varied, and not even a hint that it ever would be desirable to change that distance from what was specifically shown in the drawing, but that, as a matter of fact, there was nothing in that drawing which would convey to a person making such device any idea as to how he could alter the said distance even if he wanted to.

Recess for lunch.

March 11, 2.20, P. M.

Examination resumed pursuant to adjournment.

[*Witness continues*:] The drawing, figure 7, does not even show how the uncovered leg of the magnet is to be attached to the cone, and supposing the cone to be made of pasteboard, as it might be, I doubt if the iron magnet could be attached thereto by a screw, or rivet for example, and the parts remain in firm connection if the instrument was subjected to much handling or wear; neither do I see what efficient means could be adopted in the apparatus shown in figure 7 in the way of an addition thereto, or modification thereof, for enabling the relative adjustment of the magnet and armature to be effected without some change in the organization of the instruments, which would involve independent invention, and which, when Professor Bell did make it, did apparently involve independent invention, as shown by his specification to the improvement as new and original in his later patent.

In Defendant's exhibits—both original and reproduced instruments—devices for effecting this relative adjustment of magnet and armature are present and through these devices the adjustment may be effected, in substantially the same way as shown in Defendant's exhibit "A" instrument. By loosening the screw marked *G* in Defendant's "*B* drawing," or *f* in Defendant's "Exhibit reproduced B drawing," it then becomes possible to move the electro-magnet upon its supporting piece nearer to or farther from the armature, and then by tightening the said screw it may be secured rigidly in place. Then for making the adjustment still nicer, there is provided in both instruments "B" referred to, a tension-plate, marked *H*, in Defendant's "Exhibit B drawing," and *G* Defendant's Exhibit "B" "reproduced" drawing, one end of which presses against the diaphragm, and by simply moving which plate the diaphragm and the armature attached thereto may be allowed to come nearer to, or be pushed further from the poles of the magnet. Defendant's Exhibit "B" instrument, therefore, contains in good practical working form the adjusting device for regulating the distance between magnet and armature, which is wholly absent in the apparatus shown by Bell in figure 7 of his patent of March 7th, 1876. Therefore, I think that two instruments such as Defendant's "Exhibit B reproduced," if joined in a voltaic circuit, would be operative as a speaking telephone; whereas Bell's device above referred to would not be, and is not.

Q. 36. Please compare the two original Drawbaugh instruments, which are here in evidence, as Defendant's "Exhibit D" and Defendant's "Exhibit E" with Professor Bell's two patents dated March 7th, 1876, and January 30th, 1877, stating your conclusions and reasons therefor, and referring to any tests you may have made.

Ans. Defendant's "Exhibit D" and E" instruments have also been described by Mr. Knight and Mr. Drawbaugh in their testimony in this case. Comparing these instruments with what Professor Cross finds shown and described in figure 7 of Bell's patent of March 7th, 1876, I am of the opinion that the said instruments "D" and "E" contain essentially the same elements existing in said Bell's device, operating in like manner to produce like results, for the following reasons:

In both Bell's device and Defendant's instruments "D" and "E," I find an electro-magnet having arranged in front of its pole an armature, by the vibrations of which undulatory currents may be induced in the coils of said magnet, or which may be vibrated by the influence of said magnet, when undulatory currents are passed through the coils thereof. Although embodying a permanent magnet, and hence being designed for use in a circuit without a battery, two instruments "D," or two instruments "E" may be connected in circuit, or one instrument "D" and one instrument "E" may be connected in the same circuit, and if the apparatus shown in figure 7 of Bell's patent of March 7th, 1876, is as Professor Cross asserts, an operative speaking telephone, then the instruments "D" and "E," for the same reasons as he gives, would be also operative telephones.

I find also in Defendant's instruments "D" and "E" the essential elements of the second, third, fourth, fifth, sixth, seventh and eighth claims of Bell's patent of January 30th, 1877, operating in substantially the same manner to produce a like result, for the following reasons:

When two of said instruments "D" and "E" are united upon an electric circuit as transmitter and receiver, there may be produced in the armature of each receiving instrument any given motion, by subjecting said armature to an attraction varying in intensity, substantially as set forth in the second claim in Bell's patent aforesaid. Said instruments "D" and "E" contain also the combination with an electro-magnet of a plate of iron which can be thrown into vibration by the movement of surrounding air or the attraction of a magnet, as recited in the third claim. They also contain, in combination with the plate and electro-magnet, means of adjusting the relative position of the two, so that, without touching, they may be set as closely together as possible, substantially as recited in the fourth claim. They are electric telephones, and as such embody a magnet with a coil upon the end of the magnet nearest the plate, as recited in the fifth claim. They also show the combination with an electric telephone of a sounding-box, substantially as recited in the sixth claim. The sounding-box is so arranged as to protect the diaphragm from the action of extraneous sounds; also to form a reduced space in front of the plate; also to form a reduced orifice, which admits the sound waves to the plate, directly at its centre; all substantially as described by Professor Cross in his testimony in regard to the sounding-box in Bell's patent of January 30th, 1877, and in his answers to the 24th and 25th interrogatories, in Complainant's *prima facie* case. I regard the mouth-pieces of these instruments "D" and "E" as, substantially, speaking or hearing-tubes for conveying sounds to or from the telephone, and I also find in said instruments "D" and "E" the combination of a permanent magnet with a plate of iron, with a coil upon the end of said magnet nearest the plate; so that the instruments may be used in circuit without a battery, substantially as set forth in the eighth claim. I have not referred to the first claim of Bell's patent of January 30th, 1877, because it does not seem to refer so specifically to a speaking telephone as do the other claims, relating more particularly, as I understand it, to the improvement in multiple harmonic telephony, set forth in the specification. If it be regarded, however, as including speaking telephones, I find that if two instruments "D" and "E" be united in an electric circuit, then motion produced in the armature of one instrument, by sound or otherwise, will be reproduced in the armature of the other instrument in the same circuit, in like manner and form substantially as set forth in said claim.

I have subjected these two instruments, Defendant's "Exhibits, D and E," to repeated tests, at the same place and under the same general conditions that I have mentioned with regard to previous tests, but in connection with each other upon the same circuit, and in connection with other instruments. The instrument "E," has no adjustable plug —this piece, I understand, having been lost or mislaid after the instrument was originally made. In making the tests I put in a plug and adjusting screw, exactly fitting the place provided for them, the said plug and screw being substantially like the corresponding plug and screw marked *c'* and *F*, in Defendant's "Exhibit D drawing," and existing in Defendant's "Exhibit D" instrument. I tested these instruments, "D" and "E," on November 29th and 30th, and December 1st, 1881, in the following manner. I first compared them, in point of efficiency in transmitting speech, with the two Tisdel instruments referred to in a previous answer, which two Tisdel instruments bore quite a close resemblance to them in point of size, compactness and general arrangement. By attaching the two Tisdel instruments at opposite ends of the circuit, and causing speech to be transmitted through them, I determined the continuity of the circuit and obtained an idea of the intensity and distinctness of the sound as they transmitted it. Then I removed the Tisdel instrument at one end of the line, and substituted therefor Defendant's instrument "E," and on listening at this instrument, heard speech through the line, so far as I could judge, nearly, if not quite, as well as through the Tisdel instrument which it replaced. I then caused speech to be uttered into the instrument "E," and listened myself at the Tisdel instrument at the opposite end of the line, and again heard speech clearly through the wire, thus satisfying myself as to the efficiency of the instrument, both as a transmitter and a receiver. I then tested instrument "D," in precisely the same way, using it both as a transmitter and a receiver, and hearing through it speech through the line clearly and distinctly. I then attached instrument "D" to one end of the line and instrument "E" to the other, and I again heard speech through the line on listening at either instrument. I then maintained conversation through the line, recognized different sounds, and also different persons by their voices. Although I made these experiments with every care, and exercising the precautions already described, I repeated them afterwards, in a manner which, I consider, effectually bars out any possibility of an instrument being changed at one end of the line while I was out of sight of it at the other. To this end I caused the circuit to terminate at the out-house, where I stationed myself at one extremity, and just inside the shop window, on the upper floor, at the other. By standing near the door of the out-house, I could distinctly see the farther end of the circuit, and watch the motions of a person there stationed. The line passed through a hole in the window-glass, so that the sash could be kept down, thus cutting off the sound of the voice of the person at that end of the circuit, so that the sound did not pass through the air to my position in the out-house. At the window end of the line I stationed Mr. Heiges, who has already testified in this case, and he took off and applied the several instruments at his end of the line when I shouted to him to do so, holding up wires and instrument so that I could see him put them on and take them off, and keeping them in my sight while he was talking through them. The distance between myself and the window was only about forty feet, so that I could easily recognize instruments by their forms. I should also mention that the out-house was provided with a door, which I kept nearly closed, except when shouting to Mr. Heiges directly, and by this means I was able to cut off still better any sound of his voice which otherwise might reach me through the air. I attached and detached the instruments at my end of the line myself. On repeating the tests, as already described, under these conditions, I obtained the same results already mentioned, namely, good transmission of articulate speech through the line and instruments. I have stated heretofore in this answer, that in my opinion the instruments "D" and "E," would work well with a battery in circuit, the preceding tests with these instruments, it should be understood, being made without a battery of any kind being in the line. I now made another test of instrument "E," this time without the adjustable plug, which I have stated I inserted in the instrument during the preceding tests, being in place, with Defendant's instrument "H," which is a carbon transmitter, at the other end of the circuit, a battery being connected with said circuit. With this arrangement, on listening at instrument "E," I clearly heard speech uttered into instrument "H," through the line. Then I substituted Defendant's instrument "D," in place of instrument "E," transmitter "H" remaining attached, and heard speech through "D," and the line with great clearness.

Q. 37. Mr. Daniel Drawbaugh has testified, in effect, that since originally making the instruments "D" and "E," he has made no change in either of them, except to hollow out a little recess in the case of instrument "D," around the electro-magnet and directly in rear of the diaphragm, and which appears in the drawing of instrument "D," marked "Section on line *x x*," and that the existence or non-existence of this recess effected no difference in the operation of the instrument; what is your opinion in regard to any practical effect of such recess upon the working of the instrument?

Ans. I agree with Mr. Drawbaugh, that the existence or non-existence of that recess has no material effect upon the practical operation of the instrument.

Q. 38. Professor Cross, in his deposition heretofore given in this cause, refers several times to the fact that the helix in the electro magnet of Bell's instrument, patented January 30th, 1877, is wound around the end, or near the pole of the permanent magnet; in Defendant's "Exhibits D," "E," and "reproduced" "C" and "I," the helix wires are not wound around the end of the permanent magnet, but are wound upon cores of inductive material, and separate permanent magnets are employed having their poles in contact with the rear end of said cores; Would this difference of construction make any difference in the operation of the instrument, or not; and give your reasons with your answer?

Ans. Substantially, it would not. By contact with the poles of the permanent magnet the cores themselves become magnets by induction, so that they act virtually as an extension of the permanent magnet itself, the poles of the magnet then being, for practical purposes, the farther ends of the cores. In his patent of January 30th, 1877, Professor Bell indicates no substantial difference between these arrangements, as in one of his drawings, figure 2, he shows the coil directly surrounding the permanent magnet, and near its end; and in another drawing, figure 5, he shows the permanent magnet with pole-pieces in contact with the ends of the magnet, which pole-pieces form coils around which the cores are wound.

Adjourned until Monday, March 13th, 1882, at half-past ten o'clock A. M.

March 13th, 1882, *half-past ten oclock*, A. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Examination of Mr. Park Benjamin by Mr. Hill continued.

Q. 39. In the same manner, please compare the two Drawbaugh instruments "G" and "O," here in evidence, with the two Bell patents of March 7th, 1876, and January 30th, 1877, and state your conclusions, with your reasons, referring, if you please, to any tests which you may have made. As some of the minor parts of these instruments have been mislaid or lost, you may refer to the deposition of Daniel Drawbaugh, concerning those parts.

Ans. Both of these instruments "G" and "O" are carbon transmitters operating to produce an undulatory current by varying the resistance in the circuit through which the battery current passes. I understand from Mr. Drawbaugh's testimony, to which I have been referred, that the instrument "O" was originally the same in construction as the instrument "G," but afterwards underwent certain modifications in form, which he describes, which modicafitions do not, in any wise affect the principle of operation of the apparatus. I also learn from Mr. Drawbaugh's testimony that in both of the instruments "G" and "O" carbon balls were provided, arranged in series in contact with one another, and touching the carbons shown in the cups *c* and *F*, in Defendant's "Exhibit O drawing;" and also being arranged in series and in contact with the carbon ball *H*, and contact-tip and cup *G*, in Defendant's "Exhibit G drawing." In Defendant's "Exhibit G drawing" these carbon balls are represented, I understand, by dotted lines. I understand further, that when said carbon balls were in place, as stated, in Drawbaugh's instrument "G," the current passed into one of the screw-posts *E*, in Defendant's "Exhibit G drawing," then to one of the contact-plates; through the carbon balls into the other contact-plate, and through the conducting wire to the other of the screw-posts *E*; and I understand further, that when speech was uttered in front of the diaphragm, the latter, being thrown into vibration, compressed the carbon balls together in greater or less degree, so causing changes in the resistance of the circuit, and thus modifying the battery current to render it undulatory. I also understand from Mr. Drawbaugh's testimony that when the carbon balls were in place, as described in instrument "O," the current was led by a wire to the rear carbon-holder, thence passed through the carbon balls to the diaphragm, to which was attached a conducting wire, from which the current was taken through the rest of the circuit. The operation of this instrument "O" I understand to have been the same as I have already described in regard to instrument "G."

For the same reasons that I have already given when speaking of Defendant's instrument "F," I do not find it possible to institute a comparison between these instruments "G" and "O," and any specific apparatus of like character described in either of Bell's patents. Taking Professor Cross' opinion, however, to be correct, that Bell's patent of March 7th, 1876, does properly set forth a speaking telephone depending for its operation upon variations produced in the resistance of the circuit, then I find in Defendant's instruments "G" and "O" devices for accomplishing a like result, constructed and based on a like principle.

I tested Drawbaugh's instruments "G" and "O" at the same place, and under the same general conditions as I made the tests referred to in a previous answer. I connected instrument "O" to one end of the line as a transmitter, a battery being joined in the circuit, and one of the Tisdel magneto instruments, previously mentioned, being connected to the other end of the line as a receiver. On listening at the Tisdel instrument I heard speech through the line with great clearness and distinctness. I then removed the instrument "O" and substituted instrument "G" in its place, and then, on listening at the Tisdel instrument, I heard speech through the line clearly and distinctly. I then took off the Tisdel instrument and attached first, Drawbaugh's instrument "L," and afterwards Drawbaugh's instrument "M," and, on listening at these last mentioned instruments in turn, I found no difficulty in hearing speech through the line. I also used Drawbaugh's instrument "G" as a transmitter with the "reproduced" instrument "B" as a receiver, in one of the tests of the last mentioned instruments already described, when I heard speech through the line on listening at said instrument "B." In making these tests the carbon balls, not shown in Defendant's "G" and "O" drawings, were put into the instruments, and they were thus rendered perfectly operative. I consider both of these instruments "G" and "O" as exceedingly good carbon transmitters. It will be seen that both of these instruments contain elements set forth in Bell's patent of January 30th, 1877, in that they are provided with a sounding box, which protects the diaphragm from extraneous sounds, in which there is a reduced space in front of the diaphragm, and in which there is a reduced orifice arranged at the centre of the diaphragm. They therefore contain the same essential elements that Professor Cross finds to be present in both Bell's patent of January 30th, 1877, and the Klemm carbon transmitter, operating in a similar instrument to produce the same results in the same way.

Q. 40. In the same manner please compare the Drawbaugh instruments "L" and "M" with said two Bell patents, stating your conclusions and reasons, and referring to any tests you may have made.

Ans. The construction of the two instruments "L" and "M," as described by Mr. Drawbaugh in his testimony, is closely similar. In each of them, in the forms shown in Defendant's drawings of "reproduced L and M," is combined in a single apparatus means for varying the current by changes in the electro-motive force, and also means for accomplishing a like result by producing variations in the resistance. Comparing them with Bell's patent of March 7th, 1876, I find in them substantially the same essential elements as Professor Cross finds shown and set forth in figure 7 of said patent, operating to produce a like result in substantially the same way, for the following reasons:

In both Bell's device and Drawbaugh's instruments "L" and "M" is contained an electro-magnet, before the plate of which is arranged an armature, by the vibration of which armature undulatory currents may be caused in the coil of said magnet, or which armature may be thrown into vibration by said magnets when undulatory currents are passed through the coil thereof. In both Bell's device and Drawbaugh's instruments "L" and "M" is provided a tube for concentrating sounds made into it upon a diaphragm, to which diaphragm the armature of the magnet is connected. If, for the reason stated by Professor Cross, the apparatus shown in figure 7 of Bell's patent of March 7th, 1876, is an operative speaking telephone, then for the same reasons either of Drawbaugh's instruments "L" and "M" is also a speaking telephone. Although intended for use without a battery, two instruments "L," or two instruments "M," or one instrument "L" and one instrument "M," may be joined by, and at opposite ends of a voltaic circuit, and when so joined will operate in substantially the same way to produce the same results, as the apparatus shown thus connected, in figure 7 of Bell's patent of March 7th, 1876.

If Bell's patent of March 7th, 1876, does, as Professor Cross asserts, properly set forth an operative speaking telephone, in which undulatory currents are produced in a circuit by variations in the resistance, then I find in Drawbaugh's instruments "L" and "M," in the forms shown in Defendant's "Exhibits reproduced L and M" drawings, means for producing the same result in the same way, for the reason that in said instruments "L" and "M" the current from a battery is conducted through a series of carbon balls in contact, which carbon balls are more or less pressed together, and the resistance in the circuit more or less varied, and an undulatory current so produced by the action of the diaphragm when thrown into vibration by vocal speech.

I also find in Drawbaugh's instruments "L" and "M" essential elements of Bell's patent of January 30th, 1877, for the following reasons: If two instruments "L" or two instruments "M," or one instrument "L," and one instrument "M," be united upon and by means of an electric circuit, then, if motion of any kind or form be produced in any way in the armature of any one of said instruments, the armature of the other instrument in said circuit will be moved in like manner and form, substantially as set forth in the first claim.

If two instruments "L," or two instruments "M," or one instrument "L," and one instrument "M," be united as transmitter and receiver upon an electric circuit, then there may be produced in the armature of the receiving instrument any given motion, by subjecting said armature to an attraction varying in intensity, substantially as set forth in the second claim.

In both Drawbaugh's instruments, "L" and "M," there exists the combination with an electro-magnet of a plate of iron, which can be thrown into vibration by the movement of the surrounding air, or by the attraction of a magnet, substantially as set forth in the third claim.

In both Drawbaugh's instruments, "L" and "M," there exist means for adjusting the relative position of electro-magnet and plate, so that they may be adjusted together as closely as possible without touching, substantially as set forth in the fourth claim.

There is formed in Drawbaugh's instruments, "L" and "M," a magnet, with a coil upon the end of said magnet nearest the plate, substantially as set forth in the fifth claim.

There is combined with Drawbaugh's instruments, "L" and "M," a sounding box, so constructed as to protect the plate from extraneous sounds, to afford a reduced space in front of said plate, and a reduced orifice opening upon the centre of said plate, substantially as Professor Cross finds sets forth in his sixth claim.

There is combined with the instruments, "L" and "M," a speaking or hearing-tube, for conveying sounds to or from the telephone, substantially as set forth in the seventh claim.

Finally, there exists in Drawbaugh's instruments, "L" and "M," the combination with a permanent magnet of a plate of iron, with coils upon the ends of the magnet nearest the plate, by means of which contrivance the instruments may be used in a telephonic system without a battery, substantially as set forth in the eighth and last claim.

I tested Drawbaugh's instruments "L" and "M," in the same place and under the same general conditions mentioned in descriptions of tests, on December 1st, 1881, attaching each instrument, in turn, to one end of a circuit including a battery, using Defendant's instrument "G," as stated in my previous answer, as a transmitter; as I have already stated, I heard speech clearly on listening at either instrument, "L," or "M."

In order to prevent any ambiguity in this answer, I desire to call attention to the fact, that I have drawn my comparison, so far as the carbon transmitter is concerned, and when referring to Drawbaugh's instruments as containing both carbon transmitter and magneto-telephone, between Bell's devices and the reproductions of instruments "L" and "M," as shown in Defendant's "Exhibits reproduced L and M drawings." These instruments embody both a carbon transmitter and a magneto-electric telephone, as already pointed out. What I understand to be the original forms, of the above named instruments, were used in the tests; and in these instruments, as shown in Defendant's "Exhibits L and M drawings," no carbon transmitter was present. Instrument "L" was used as it is shown, without any adjusting-screw corresponding to the adjusting-screw marked *F*, in Defendant's "Exhibit M drawing," in position, the adjustment of the magnet to the diaphragm being effected by other means. I found, however, that the speech heard through the line, through instrument "M," which had the adjusting-screw in it, was rather the clearer, although other parts intended to be used in connection with that screw were absent; and thus, I believe, it did not work as originally intended.

Q. 41. In the same manner please compare the Drawbaugh instrument "H," here in evidence, with said two Bell patents, of March 7th, 1876, and January 30th, 1877, giving your conclusions and reasons therefor, and referring to any tests you have made.

Ans. The construction of instrument "H," was described quite fully, both by Mr. Knight and Mr. Drawbaugh, in their testimony given in this suit. It is a carbon transmitter, working on the same principle as instruments "G" and "O," already described. The current is led through a series of carbon balls in contact, and is rendered undulatory by these carbon balls being more or less pressed together, and the resistance in the circuit so varied by the vibrations of the diaphragm when speech is uttered before it.

For the same reasons given by Professor Cross, if Bell's patent of March 7th, 1876, does set forth an operative speaking telephone, working through variations in the resistance of the circuit, then I find in Drawbaugh's instrument "H," because of the construction already mentioned, an apparatus constructed on the same principle, to accomplish the same results in substantially the same way.

I also find in Drawbaugh's instrument "H," the elements that Professor Cross finds set forth in the sixth claim of Bell's patent of January 30th, 1877, for the reason, that in said instrument "H," there is combined with an electric telephone, a sounding-box, so constructed as to protect the plate, or diaphragm, from extraneous sounds; also so as to afford a reduced space in front of said diaphragm, and a reduced orifice opening upon the centre of said diaphragm, this construction and arrangement being substantially the same as that existing in the Klemm carbon transmitter.

I tested Drawbaugh's instrumant "H," under the same general conditions and at the same place, referred to in my description of other tests, on November 30th, 1881. I connected the instrument "H," to one end of the line as a transmitter, joined a battery in the circuit, and used Drawbaugh's instruments "D" and "E," alternately, as receivers. I heard speech, uttered through instrument "H," and the line, clearly through the instruments "D" and "E." I also used Drawbaugh's instrument "A," as a receiver, Drawbaugh's instrument "H," being still used as a transmitter, and heard speech distinctly through the line, on listening at instrument "A."

I omitted to mention this test, so far as affecting instrument "A," in my answer describing my tests of that instrument.

Recess for lunch.

March 13, 1882, 2:30 P. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Examination of Mr. Park Benjamin by Mr. Hill continued.

Q. 42. In the same manner, please compare the Drawbaugh machine "J," with said two Bell patents, giving your conclusions and reasons?

Ans. This instrument is quite fully described by Mr. Knight, in answer to question 147, page 767 [737], of Defendant's printed record, and also by Mr. Drawbaugh, in answer to question 330, page 841 [808], of Defendant's printed record.

The route of the electric current in this instrument is stated by Mr. Drawbaugh in his answer to the 646th question, page 905 [870], of Defendant's printed record, to be correctly shown in Defendant's "Exhibit J" circuits.

Drawbaugh's "J" instrument is constructed on the same principle as his "H" instrument, referred to in my preceding answer; that is to say, the current is led through a series of carbon balls, and is rendered undulatory by the carbon balls being more or less pressed together, and the resistance in the circuit so varied by the vibration of the diaphragm when speech is uttered before it. In Drawbaugh's instrument "J" there are two sets, or series, of carbons affected simultaneously by one and the same diaphragm.

For the reasons given by Professor Cross, if Bell's patent of March 7th, 1876, does set forth a speaking telephone depending for the production of its undulatory currents upon changes of resistance in the circuit, then, in Drawbaugh's instrument "J," which operates on the same principle in like manner to produce like results, I find such a telephone as is set forth in Bell's patent of March 7th, 1876.

I also find in Drawbaugh's instrument "J" the combination of an electric telephone and a sounding-box, said box being so arranged as to protect the diaphragm from extraneous sounds, to afford a reduced space in front of said diaphragm, and a reduced orifice opening upon the centre of said diaphragm, these parts being similar in construction, operation and purpose to those found by Professor Cross to be recited in the sixth claim of Bell's patent of January 30th, 1877, and in the Klemm carbon transmitter.

Q. 43. In the same manner please compare the Drawbaugh instrument "P," here in evidence, with said two Bell patents, giving your conclusions and reasons, and referring to any tests you may have made.

Ans. Instrument "P" is very fully described by Mr. Knight, in answers to questions 140 and 141, pages 756 [726] and 759 [729], and by Mr. Drawbaugh, in answer to question 345, page 848 [814], of Defendant's printed record. In answer to question 646, page 904 [870], Defendant's printed record, Mr. Drawbaugh says, with regard to the electric currents, that they are correctly shown on the tracings marked "Exhibit P tracings, No. 1" and "Exhibit P tracings, No. 2."

Drawbaugh's "P" instrument contains a magneto-electric telephone and a carbon transmitter. The magneto telephone embodies a permanent magnet, to one of the poles of which is fastened a core, around which core is a coil, which is joined in the circuit. In front of the end of the core, which thus becomes a part of the magnet, is a metal plate, which serves as an armature, capable of inducing undulatory currents in the coil by its vibration, or of being vibrated by the magnet, when the latter is affected by undulatory currents passed into said coil. For reasons which I have already fully set forth, in referring to Drawbaugh's instruments "L" and "M" and others embodying a like construction to that above described, I find in Drawbaugh's instrument "P" substantially the same elements found by Professor Cross to exist in the apparatus shown in figure 7 of Bell's patent of March 7th, 1876, and operating in like manner to produce like results.

For the same reasons already stated with regard to Drawbaugh's instrument "L," I find existing in and in connection with so much of Drawbaugh's instrument "P" as has thus far been noted by me, substantially the same elements set forth in Bell's patent of January 30th, 1877, operating in like manner to produce a like result.

In the carbon transmitter contained in Drawbaugh's instrument "P," I find that the resistance of the circuit may be varied by the vibrations of the diaphragm more or less pressing together pieces of carbon through which the circuit is led, the current thus being rendered undulatory. According to Professor Cross' testimony, such an instrument is substantially set forth in Bell's patent of March 7th, 1876, and substantially the same essential elements are therefore present, operating in a like manner to produce the same result, both in Bell's device and in Drawbaugh's instrument "P."

I tested Drawbaugh's instrument "P, reproduced" under the sam general conditions and at the same place, as I have mentioned in describing other tests, and on December 1st, 1881, I attached instrument "P reproduced" at one end of the line and a Tisdel magneto instrument, such as I have already referred to, at the other end of the line; a battery was joined in the circuit. On listening at the Tisdel instrument, I heard speech through the line uttered into the carbon transmitter of Drawbaugh's instrument "P reproduced." Then stationing myself at said instrument "P reproduced," I heard speech through the line, which was uttered into the Tisdel instrument at the other end, finally, by talking, myself, into the carbon transmitter of instrument "P reproduced," and listening at the magneto-telephone of said instrument, I was enabled both to send and receive speech through the line, and conveniently to maintain a conversation with the person at the Tisdel instrument at the other end.

Q. 44. In like manner, please compare the Drawbaugh instrument "N," with said two Bell patents?

A. Drawbaugh's instrument "N," is described by Mr. Knight, in answer to question 146, page 766 [735], and by Mr. Drawbaugh, in answer to question 352, page 851, [818], Defendant's printed record; this instrument contains an electro-magnet, with an armature in front of its poles, which magnet, when undulatory currents are passed through its coil, causes vibrations in the armature, and the armature, when vibrated, modifies, so as to render undulatory, currents led into the coils of the magnet. For reasons which I have already fully given, this instrument "N," contains substantially the same elements found by Professor Cross to exist in the apparatus shown in figure 7 of Bell's patent of March 7th, 1876, operating in like manner to produce like results; also, for the reasons which I have already fully given, with regard to Drawbaugh's instruments "L" and "M," this instrument contains substantially the same elements set forth in Bell's patent of January 30th, 1877, and operating in a like manner to produce a like result.

[*Defendant's counsel asks Complainant's counsel to state on the record what claims, of the two Bell patents, are to be regarded as involved in this suit.*

The Complainant's counsel states, that in their PRIMA FACIE *case their testimony was confined to claim five, of the first patent, see interrogatory* 17, *page* 35, *and to claims five, six and eight, of the second patent, see interrogatory* 21, *page* 40, *of Complainant's printed record; and that the infringement of those claims alone is relied upon in this case. Complainant's counsel, however, states that he does not intend to admit that the in-*

struments do not, in fact, infringe other claims, but merely that the question of the infringement of other claims will not be used as a ground of recovery in this suit.

Q. 45. Will you please look at the fifth claim of Alexander Graham Bell's patent, No. 174,465, dated March 7th, 1876, and, assuming Professor Cross' understanding of that claim to be correct, please state which of all the Drawbaugh instruments here in evidence you find to contain substantially the method and apparatus therein referred to, operating in substantially the same way, and producing substantially the same results as claimed in said fifth claim?

A. Adopting Professor Cross' understanding of that claim, especially to the effect that it includes both magneto-telephones and carbon transmitters, then I find in all the Drawbaugh instruments, about which I have testified, the method and apparatus referred to in said claim, operating in substantially the same way and producing substantially the same results.

Q. 46. Answer the same question with reference to the fifth claim of Alexander Graham Bell's patent, No. 186,787, dated January 30th, 1877?

A. I find substantially the same elements set forth in that claim, operating in like manner to produce substantially the same result, in Drawbaugh's instruments "C," "D," "E," "I reproduced," "L," "M," "N," "P."

Q. 47. Answer the same question as to the sixth claim of the patent last referred to?

A. I find substantially the same elements set forth in that claim, operating in like manner to produce substantially the same result, in Drawbaugh's instruments "A," "D," "E," "G," "H," "I," "J," "L," "M," "N," "O," "P."

Q. 48. If you assume the electric telephone, referred to in that sixth claim, to be the equivalent of any electric speaking telephone, then would or would not Drawbaugh's instrument "F," with its glass tumbler and wooden mouth-piece inclosing the operative mechanism, contain substantially the same invention?

A. I answered the last question assuming Professor Cross' explanation of the claim, as given in his answers to the 23rd and 25th interrogatories, in his testimony in Complainant's *prima facie* case, to be correct; and I find in all the instruments above mentioned the three elements which he points out as existing in that claim, namely: the box inclosing and protecting the diaphragm, the reduced space in front of the diaphragm, and the reduced orifice opening upon the centre of the diaphragm. All of these elements exist in Defendant's instrument "F," though the reduced space in front of the diaphragm is not so clearly apparent in Defendant's "reproduced F drawing" as it is in the reproduced instrument itself.

Q. 49. Referring to the eighth claim, of Professor Bell's patent of January 30th, 1877, please state which of the Drawbaugh instruments here in evidence you find to embody the same invention as therein claimed, assuming Professor Cross' understanding of said claim to be correct?

A. I find substantially the same elements set forth in that claim, operating in like manner to produce substantially the same results, in Drawbaugh's instruments "C," "D," "E," "I, reproduced," "L," "M," "N," "P."

Adjourned until March 14th, 1882, at half-past ten o'clock, A. M.

March 14th, 1882, 11 o'clock, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Examination of Mr. Park Benjamin by Mr. Hill continued:

Q. 50. Please examine the cup-machine described by Mr. Daniel Drawbaugh, pages 787 to 703, [756 to 761,] of Defendant's printed record, and state what inventions you find therein, and how said inventions compare with the inventions described and claimed in the two Bell patents here in controversy?

A. The apparatus described by Mr. Drawbaugh chiefly in his answer to the 51st question, page 788, [757,] Defendant's printed record, is a telephonic transmitter substantially similar in construction and operation to his instrument "F." The current passes, through a rod attached to the diaphragm, to a plate resting on finely pulverized material, such as pulverized charcoal or other forms of carbon; thence to a cup-shaped plate beneath said material; and finally, through a wire fastened to said plate, to the circuit. The diaphragm, on being vibrated by sound-waves produced by the voice, causes more or less pressure to be applied to the pulverized carbon, thus varying the resistance offered by said carbon to the current, so rendering the latter undulatory. If, as Professor Cross considers, Bell's patent of March 7th, 1876, does properly set forth a telephone operating through variations in the resistance of the circuit, then, in my opinion, the instrument referred to and described by Mr. Drawbaugh embodies the same principle in substantially the same way and operates to produce a like result. If, however, Bell's patent of March 7th, 1876, is not considered to set forth such a telephone, and if, in consequence, his patent of January 30th, 1877, is construed to cover any form of electric speaking telephone, then the apparatus described by Mr. Drawbaugh, as above stated, being an electric speaking telephone, when used with a suitable receiver and with a battery in circuit, embodies broadly what is set forth in said patent of January 30th, 1877. I understand that this transmitter was used in a circuit with a battery, and with a receiver analogous in form to Defendant's Exhibit "B" instrument.

Q. 51. Please examine the modified instrument "B," as described and represented on page 794 [762], of Defendant's printed record, and state what inventions you find in it, and how it compares with Defendant's instrument "B," here in evidence.

Ans. The principle involved in the operation of this instrument and Defendant's instrument "B" is the same in both. In the instrument shown in the "Exhibit D. Drawbaugh sketch, No. 2," the electromagnet is placed at a considerable distance from the diaphragm, and the armature arranged before the poles of the magnet, instead of being fastened to and in contact with the diaphragm itself, is connected thereto by a cord extending between armature and diaphragm. When said armature is caused to vibrate by undulatory currents passing through the coil of the magnet, these vibrations are transmitted to the diaphragm through the medium of the tense string, which is obviously a purely mechanical connection.

The differences, therefore, existing between this instrument and Defendant's instrument "B" are not essential ones, and consequently, for the same reasons already given with regard to Defendant's instrument 'B," I find in the apparatus shown in Defendant's "Exhibit D. Drawbaugh sketch, No. 2," the same essential elements Professor Cross finds in the apparatus shown in figure 7 of Bell's patent of March 7th, 1876, operating in substantially the same way to produce the same result. I also find in Defendant's "Exhibit D. Drawbaugh sketch, No. 2," means for easily adjusting the relative distance of armature and magnet, substantially as set forth in Bell's patent of January 30th, 1877, this means residing in the possibility of loosening the screw which holds the armature-spring *G*, so that the armature may be adjusted with relation to the magnet and the screw afterwards tightened.

Defendant's "Exhibit D. Drawbaugh sketch, No. 3," shows the transmitter referred to in my preceding answer, the apparatus shown in "D. Drawbaugh sketch, No. 2," and a battery, joined in a closed circuit. In my opinion, the instruments thus joined together, for the reasons already given, constitute an operative telephonic system capable of transmitting and receiving speech by means of an undulatory current.

Q. 52. Please examine the testimony of Mr. Daniel Drawbaugh, pages 808 to 817 [776 to 785], Defendant's printed record, relating to the original modified form of the Drawbaugh instrument "C," and compare the modified instrument with the instrument shown in exhibit "reproduced" "C," making such observations upon the relation of the two instruments to each other, and to said two Bell patents as you think proper.

Ans. I understand from Mr. Drawbaugh's testimony that the body or chamber of instrument "C" originally contained two diaphragms—membranes—one of which was held between the two parts of the chamber—that is, the main body and the rim—by friction, and the other was fastened over the end of the rim. To this second diaphragm was attached an armature, and between the two diaphragms, at their centres, extended a string. The diaphragm first mentioned had several small holes made in it. Facing the armature was the electro-magnet. So that, to sum up, the order of parts was, as I understand it, first, the electro-magnet; then the armature in front of its poles attached to a diaphragm, which diaphragm extended over the mouth of the rim of the body of the instrument; then a second diaphragm, which was perforated, parallel to the first and held between rim and body, there being a string between the centres of these diaphragms; then the sound concentrating-tube formed by the body; and finally the orifice at which sound was received.

It will be obvious that, essentially, the instrument, as thus constructed was the same as Drawbaugh's instrument "B," with the addition of the second diaphragm connected, as stated, to the one carrying the armature. But this second diaphragm, merely repeating the movement of the first one by a mechanical connection, would in nowise affect the operation of the instrument in principle nor, in fact, could it be of any material use therein. Consequently the instrument "C" in the form in which Mr. Drawbaugh states it originally was, and as I have described it above, contains substantially the same elements as Professor Cross finds shown and described in figure 7 of Bell's patent of March 7th, 1876, operating in substantially the same way to produce the same result, for the reasons that I have already given in comparing Drawbaugh's instrument "B" with the aforesaid device of Bell's.

As, in pointing out the difference between his original construction of "C" and that shown in Defendant's exhibit reproduced instrument "C," Mr. Drawbaugh makes no mention of his method of holding the magnet in place, I infer that the method of securing it, in the original form of the instrument, was the same as is now shown in the reproduced instrument; that is, by the screw and plate *e*, *é*, in Defendant's "reproduced "C" drawing." This arrangement obviously affords a means of adjusting the distance of the magnet with relation to the armature, by loosening the screw *é*, then sliding the magnet into the desired position and finally tightening the screw. If, as I understand, this contrivance existed in the original form of the instrument as I have described it above, then that instrument contained the means of adjusting the relative distance of magnet and armature, substantially as set forth in Bell's patent of January 30th, 1877.

Referring now again to Mr. Drawbaugh's testimony, I find that he describes the modifications which he made in the original form of the instrument, to convert it into the form shown in Defendant's Exhibit "reproduced" "C," to be the following:

It should be remembered that the original instrument was intended to be used as a receiving instrument with a battery; that is, in the same way the instrument "B" was used. Consequently the most important improvement was the addition of the permanent magnet, whereby the apparatus could be used without a battery. In adding this magnet, Mr. Drawbaugh says he took off a bar which connected the cores of the electro-magnet—which bar simply completed the U formed by itself and the cores—and then brought the poles of the permanent magnet in contact with the ends of the cores. In other answers I have explained what the effect of this is, so far as rendering the cores magnetic is concerned.

The modification next in importance was the removal of part of the rim of the body of the instrument, and the suppression of the perforated diaphragm and the connecting string. The result of that modification was a shorter or shallower sounding-box, with only one diaphragm.

Lastly, he changed the diaphragm which remained, from a membrane to a thin German-silver plate.

Now, by comparing these modifications with what Bell sets forth in his patent of January 30th, 1877, it will be seen that both Drawbaugh and Bell traveled over pretty much the same road. Assuming Bell's device in his patent of March 7th, 1876, to be an operative one, then, it being substantially the same, as I have already pointed out, as Drawbaugh's original instrument "C," it will be seen that in passing from the form shown in the 1876 patent to that shown in the 1877 patent, Bell added the permanent magnet, and thus virtually suppressed the battery in the circuit; so did Drawbaugh, in passing from the early to the later form of "C." Bell reduced the space in the sounding-box, in front of the diaphragm; so did Drawbaugh. Bell provided a reduced orifice in the sounding-box, opening upon the centre of the diaphragm; so did Drawbaugh. Bell substituted a plate of inductive material for the membrane diaphragm; so did Drawbaugh. Bell arranged his coils on the ends of the magnet nearest the plate; so did Drawbaugh. Drawbaugh had a means of adjusting the distance between magnet and plate already in his early instrument. So that, generally, so far as the changes in organization went, Drawbaugh in substance seems to have omitted but one change that Bell made, and that was, making the sounding-box entirely inclose the plate.

Recess for lunch.

March 14*th*, 1882, 2:30, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Examination of Mr. Park Benjamin by Mr. Hill continued.

Q. 53. Please examine the testimony of Daniel Drawbaugh, pages 798 to 808 [767 to 776], Defendant's printed record, with reference to his modifications of the machine "F," and compare those modifications with the machine "reproduced" "F," here in evidence, and with the two Bell patents involved in this suit.

Ans. In the testimony of Mr. Drawbaugh, referred to in the question, I find that he states that his instrument "Exhibit F reproduced" differs in some particulars from the original form of that instrument which he made, and chiefly as follows:

In the original instrument the lower plate or cup supporting the carbon was sustained by only one rod, instead of by two or a yoke, as in the modification of the instrument represented in Defendant's "Exhibit F reproduced." This single sustaining rod is shown in Defendant's "Exhibit F." So far as the actual working of the instrument was concerned, this variation would make no material difference, although the yoke support would be the better of the two, as affording more positive means of adjustment. Mr. Drawbaugh also says that the mouth-piece of the original instrument was varied in form. In the earlier forms which he made the orifice was larger and the space between the orifice and the diaphragm was higher. This difference appears on comparing the mouth-pieces respectively on instruments "F" and "F" reproduced. It will be noticed, also, that in both of these instruments the diaphragm is entirely inclosed and protected by the casing. So that, having the diaphragm thus protected in his earlier form of instrument "F" by a sounding-box, substantially as Bell has it in his patent of January 30th, 1877, all that Drawbaugh had to do, in order to embody in his sounding-box all the elements Professor Cross finds in Bell's sounding-box in the aforesaid patent, was to reduce the space in front of the diaphragm. There was, in fact, already a reduced orifice opening upon the centre of the diaphragm, and it is obvious that by reducing that orifice still further Drawbaugh would approach still nearer to the form and arrangement of orifice shown by Bell; and this is just what he did, cutting down the space between the diaphragm and mouth-piece to a very small area, and lessening the orifice, as plainly appears on comparison of instruments "F" and "F reproduced." In the original instrument Mr. Drawbaugh says, that the diaphragm was of bladder, or parchment; and I understand that the metal rod extending therefrom to the upper plate, which presses on the carbon, was connected to the diaphragm by a metal disc, through which electrical connection was made. Subsequently the parchment diaphragm was replaced by a metal diaphragm; and, in this particular, Mr. Drawbaugh obviously made the same change between the earlier and later forms of his instrument, as Bell made between the instrument shown in his patent of 1876 and that shown in his patent of 1877.

The foregoing seem to be the principal changes set forth in the testimony referred to, and they would not, in my opinion, affect the operation of the instrument in principle as a carbon transmitter; so that the early form of "F," as described by Mr. Drawbaugh, would contain what is set forth in Bell's patent of March, 1876, as found by Professor Cross, for the same reasons that I have already given with reference to Drawbaugh's instrument "F reproduced."

Q. 54. Please refer to the various instruments made by Mr. Drawbaugh, and state whether you find any, and if so, which ones, to be good, full-sized, practical, working, speaking electrical telephone instruments.

Ans. All of Mr. Drawbaugh's instruments that I have tested I know to be good, full-sized, practical, working, speaking electrical telephone instruments; and with regard to his instruments and forms of instruments, to which I have referred in my previous testimony, but have not tested, I consider that these, by reason of their form and construction, may fairly be included in that description.

Q. 55. Take Mr. Drawbaugh's development of his invention, as shown, for example, in the following machines, to wit: the old cup transmitter, the carbon transmitter "F," the receiver "B," the magneto instruments "C" and "I," the receiver "A," and the magneto instruments "D" and "E," and state how the degree or extent of the development or perfection of the invention, as shown in those instruments, compares with that shown in the instruments described and represented in Professor Bell's two patents here in controversy.

Ans. In the category of instruments given to me in the question, the old cup transmitter and the instrument "B," mark the beginnings, apparently, of two separate lines of invention, the one leading to the development of a telephone in which the undulatory current is produced by variations in the resistance of the circuit; the other to the magneto-telephone, which depends upon variations in the electro-motive force of the current. In some particulars these two lines of invention have run side by side, the improvements originally made in the one being applicable to both, and subsequently so used. With the exception of two, the instruments named to me in the question depend for their operation upon variations of the electro-motive force of the current, and so I am confined to tracing the development of that class of telephones, as shown in the instruments indicated.

The two instruments which go to make up the earliest telephonic system, of those mentioned, are the old cup transmitter and one form of instrument "B." These were joined in an electric circuit with a battery, and for the reasons that I have already given, they constituted an operative speaking telephonic system. In these instruments and their arrangement was embodied not only substantially all that Professor Cross finds existing in Bell's patent of March 7th, 1876, operating in substantially the same way to produce a like result, but also an improvement, in the shape of means for adjusting the relative position of the magnet and armature in the receiver, which Professor Bell did not describe in his patent of March 7th, 1876, but did describe as a new and original invention, in his patent of January 30th, 1877. The cup transmitter gave place to the transmitter "F," and, in passing from the one to the other, Mr. Drawbaugh adds the mouth-piece or cover, thus rendering the diaphragm completely inclosed, and alters somewhat the arrangement of the means for holding the carbon in the cup Then, modifying "F" still further, he makes therein a sounding-box, which as I have shown, contains all the features of Bell's sounding-box, and substitutes for his membrane diaphragm a plate diaphragm, such as Bell describes in his patent of January 30th, 1877. So that, in his instrument "F," Drawbaugh had, under the assumption that Professor Cross' views relating to the subject are correct, Bell's means for transmitting speech by the undulatory current, Bell's diaphragm, and Bell's sounding-box, all combined and operating together in a single, practical working instrument.

The development of instrument "B," into instrument "C," I have already traced through the earlier form of the last mentioned instrument, as described by Mr. Drawbaugh in his testimony; and in referring to "reproduced" instrument "C," I found all the essential features of Bell's device of January 30th, 1877, except the case fully inclosing and protecting the diaphragm; but this feature, as I have shown, existed in "F;" so that, at this stage in the development of his apparatus, Mr. Drawbaugh had invented, apparently, every feature of the speaking telephone which Mr. Bell is claimed to have invented, in his two patents in suit. If there is any possible flaw in this reasoning, it seems to me to lie only in the fact that Drawbaugh embodied the inclosing sounding box in one contrivance, and all the rest, of the device described in Bell's patent of January 30th, 1877, in another. Although both devices were speaking telephones, still it might be urged that it is not quite fair to carve pieces out of different machines, and put them together to suit one's self, and so make another contrivance. Mr. Drawbaugh effectually annihilates that objection in his instrument "I," (Defendant's "Exhibit I reproduced.") These he actually puts together in one compact instrument, the separated features above mentioned.

Beyond the point thus reached there appears very little room for improvement, except in form, with the object of disposing the several parts in smaller compass and rendering the instrument, if not cheaper in construction, at least more convenient to handle. This has been the tendency of other telephone constructors since the date of Mr. Bell's patent in suit, although the advance that has been accomplished in this direction has not been great. The magneto receiver now used on telephone lines in this city is scarcely, if at all, different in form and appearance from the Bell instruments which I used in 1877.

March 15*th*, 1882, 11, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Examination of Mr. Park Benjamin by Mr. Hill continued.

[*Witness continues.*]

The change in form from Drawbaugh's instrument "I" to his instrument "A" will be readily apparent from their inspection. Instrument "A" was not intended as a transmitter, or for use without a battery; so that the permanent magnet is not embodied in it. Used with a battery it could be employed either as a receiver or transmitter; and beyond the change in form perhaps the most characteristic improvement in it lies in the means for effecting the nice adjustment of magnet and armature, to which I have already referred in a previous answer.

The instruments "D" and "E" show the magneto-telephone in as compact form as it has ever been constructed, up to the present time. The magnet is flattened and curled, so as to occupy the least possible space; the means of adjusting the distance between core and diaphragm is simple, positive and easily controlled; and the instruments themselves, as I have proved, are excellent, working, speaking telephones on a circuit without a battery. They embody all the elements going to make up a speaking telephone, as described in Bell's two patents in suit. And in fact, I see no reason why, if these machines were now manufactured and were upon the market, they would not, so far as form, construction and operation are concerned, successfully compete with any forms of magneto-telephone now in vogue.

Q. 56. You have stated in your last answer that since the Bell telephone was introduced into public use, constructors had turned their attention towards improving the form and arrangement of the instrument; what knowledge have you as to the amount of effort that has been made in this direction, the number of inventors that have been employed in endeavoring to improve the electric speaking telephone, the number of patents that have been granted in this country for such alleged improvements, etc.?

A. I do not wish to be understood as saying that improvements in the telephone in general have been limited to improvements in form only. That statement had reference more particularly to the magneto-telephone as a single instrument, and not to telephonic systems generally. For there have been a great many inventions of apparatus for use in connection with telephones, parts of telephones, and in the direction of rendering their capabilities greater. I am aware that large numbers of patents have been granted for inventions of this kind, and that these numbers appear to be increasing. Thus, by reference to the official indexes of patents granted by the United States Patent Office, I find the number of patents issued and indexed under the word "telephone" to be about as follows:

1878,	33.
1879,	64.
1880, more than	100.
1881, first six months,	95.

These patents were granted to a large number of inventors. I have not seen any official index of patents issued since the one for January to July, 1881, and believe that no half-yearly index of later date has yet been given to the public. I understand that there are many patents for inventions relating to the telephone existing not classified in the indexes under the heading above mentioned, but appearing in said indexes under other headings.

Q. 57. Mr. Daniel Drawbaugh has testified, in effect, that after producing the small magneto instruments "D" and "E" he produced a number of other electric speaking telephone instruments from time to time, some of which are here in evidence. Please look at the instruments "G," "L," "M," "O," which he says came next after the small magnetos "D" and "E," and also look at the instrument "H," which he says came next after "G," "L," "M," "O," and state whether you find that he had therein developed any additional improvements, and to what extent?

A. The instrument referred to in the question I regard as the practical outcome of Mr. Drawbaugh's following the other of the two lines of invention referred to it one of my previous answers. In that answer I described the development of the magneto-telephone, as effected by Mr. Drawbaugh; so that now I have to refer to his development of the carbon transmitter, as shown by the instruments mentioned. I have already stated that this line of invention had its beginning in the old cup instrument; then followed instrument "F," and now, next in the order of development, come the instruments "G" and "O." In using the instrument "F" Mr. Drawbaugh found, as I understand him, that the powdered carbon, which he employed between the plates, was apt to become displaced, and so affect the working of the instrument; and that thereupon it occurred to him that it would be advantageous to make the carbon in solid form and in two or more pieces held in contact, the pressure between which, as before, would be varied by the action of the diaphragm. In the instruments "G" and "O" he carried out this idea, moulding the carbons into balls, which he placed in series in contact. It is curious to note that when he hit upon this idea he invented the microphone. That instrument usually consists of a piece of carbon, pointed at the ends, which are in loose contact with its supports, the current being modified by the variations of pressure between said ends and the supports. Of course this instrument is virtually the same in principle as the ordinary carbon transmitter, depending as it does upon variations of resistance in the circuit to modify the current. It is, however, more sensitive to faint sounds, and when the invention of it was first made public, in 1878, it was looked upon as a great, original discovery. By moulding his carbons into balls, or nearly ball-shaped pieces, so that they touched only a point, Mr. Drawbaugh practically made a microphone transmitter; and as a result, as my experiments showed by actual tests of the two forms of instruments, he obtained in "G" and "O" transmitters of considerably greater efficiency than instrument "F."

At the same time, he materially modified the form of the apparatus, rendering it more compact and convenient to handle, and providing means of adjustment, whereby he could regulate the contact of the carbons and so govern the normal resistance which the instrument would offer to the current.

In the forms of the instruments "L" and "M," in which the carbon transmitter appears, Drawbaugh's two lines of invention run together again; in each of these instruments he combines, substantially, his carbon transmitter "G," or "O," with his magneto-telephone "I," following more nearly the form of the latter instrument, and producing an apparatus embodying both principles in one device, thus uniting the advantages of a carbon transmitter with those of the magneto receiver. When he made his apparatus in this form, he put together a receiver and transmitter of different kinds, so that a subscriber on the line of the system, or telephone exchange, could have both at his command; in practice, however, I believe it has been found to be not advantageous to combine these two instruments in one, and that it is better to have a separate receiver, which the user can keep applied to his ear, while talking into the transmitter.

In the instrument "H," Mr. Drawbaugh brings his carbon transmitter to a higher degree of perfection. Recognizing that an instrument of that class need not necessarily be in portable form, he enlarges his sounding-box, which he intends shall be permanently secured in some convenient place. He modifies the construction of the apparatus for holding the carbon balls; so that what might be called a more elastic contact is gained between them; and so that their adjustment may be more accurately effected; thus rendering the apparatus more sensitive to the vibrations of the diaphragm. He added an induction-coil, the primary current of which passed through the carbon and the battery, and the secondary current went to the line; and he arranged, in connection with the instrument, a call-bell, which could be operated by means of the current, to attract the attention of the user.

It may be noted with regard to the improvement effected in his instrument "H," by Mr. Drawbaugh, in the means of holding the carbons, that the same is perfectly described by Professor Cross in his affidavit in Complainant's moving papers for a preliminary injunction; page 48, he says: "Speaking telephone battery transmitters, which vary the resistance of the circuit by the movement of the diaphragm, without the use of any liquid, have been in common use upwards of two years, and known somewhat longer;" and then, after mentioning the carbon, he says, that the tendency of this piece to move away from the diaphragm when the latter is vibrated is opposed by a firm and fixed support, which holds it in place, or by a tolerably stiff and sluggish spring, or by the inertia of a weight; either of which serves like an anvil, to resist a very quick and sharp impulse, such as comes from the vibrations of the diaphragm. After mentioning, that against the other side of this piece, which is commonly called the button, is an electrode carried by, or in contact with, the diaphragm, he refers to some patents, which, he says, show substantially this arrangement, and then refers to the Blake transmitter made by the Bell Telephone Company, which, he says, has been in public use since the beginning of 1879, or longer.

Recess for lunch.

March 15*th*, 1882, 2 P. M.

Examination resumed pursuant to adjournment.

Examination of Mr. Park Benjamin by Mr. Hill continued.

[*Witness continues.*]

Professor Cross describes this Blake instrument as follows: "A carbon transmitter, in which the contact is made between a metallic electrode carried on a spring and kept in contact with the diaphragm, so as to be vibrated by it, and a weighted carbon electrode carried on the end of a stiff spring provided with an adjusting-screw." Take the word "weighted" out of that quotation, and it correctly describes the carbon-holding arrangement in Drawbaugh's instrument "H," both contrivances operating in substantially the same way to produce a like result. Reference to Complainant's drawing of Exhibit Blake transmitter, in Complainant's moving papers, for a preliminary injunction, will show the similarity between the form of the Blake transmitter and Drawbaugh's instrument "H," even to the apparatus arranged on the door or cover of the box, and the presence of the induction-coil. Substantially the same arrangements appear in the Klemm carbon transmitter, one of the alleged infringing devices in this suit.

Q. 58. You have stated, in the foregoing answer, that the arrangement of a magneto-electric telephone and a carbon transmitter, substantially as shown in Drawbaugh's instruments "L" and "M," has not come into general use, it being found that it was more advantageous to have the transmitter and receiver separate, for purposes of convenience; state whether you find in any of Mr. Drawbaugh's instruments, which you have examined and about which you have testified, any arrangement of a magneto-receiver and carbon transmitter, whereby both devices may be used simultaneously, the operator speaking into the one and listening at the other?

Ans. Such an arrangement I find to exist in Drawbaugh's instrument "P, reproduced." The diaphragm of the magneto-telephone, in that instrument, has in contact with it a spiral wire, which extends through a long flexible tube, and touches another diaphragm in the ear-piece at the end of said tube; so that the vibrations of the first diaphragm are, by the wire, communicated to the second diaphragm. The operator can then hold this ear-piece to his ear, and listen while speaking into the carbon transmitter of the instrument.

Q. 59. You have classified these telephones in two general classes, or systems, to wit, the carbon class and the magneto class. Does your classification relate more particularly to transmitters, or to both transmitters and receivers, and in which class do you place the Drawbaugh receivers, "B" and "A"?

Ans. In some respects, the "B" and "A" instruments stand midway between the two classes; like the carbon instruments, they must have a battery in circuit, but when a battery is used with them they operate on the same principle as the magneto-electric instruments. I suppose it would be a more scientific classification to call these instruments electro-magnetic telephones, in contradistinction to magneto-electric telephones.

Q. 60. In testing the magneto instruments "D" and "E," did you observe whether or not they had apparently suffered any deterioration from previous rough usage or handling?

Ans. I don't know that such deterioration as they appear to have undergone should be ascribed to that cause, as much as, apparently, to age. There had evidently been shrinkage of the wooden parts; various portions had worked loose; and, in fact, the instruments were somewhat shaky. This does not affect their operation when they are adjusted, or while they are held so as to prevent any change of position of the parts, but it renders it difficult to keep them in adjustment, and practically makes it necessary to readjust them after an interval of disuse.

Q. 61. A large number of witnesses examined for the defense in this case, have testified in effect, that a good many years ago they heard talking through instruments at Mr. Drawbaugh's shop, at different times, some at one time and some at another, from 1869 down to 1880; that the instruments were, or Mr. Drawbaugh said they were at the time, operated by electricity; that they heard the talking through the instruments, so as to hear and understand what was said through them;

and many of the witnesses say that they were able to distinguish one person's voice from another through the instruments; and that many of them heard other sounds, and distinguished what they were, through the instruments. From your knowledge of the laws governing the transmission of sound, by electricity, would you or would you not, from these statements of the witnesses referred to, be able to determine the general principle of the machine or machines so used? If yes, give your conclusions and reasons, and state how the testimony of Professor Cross, given in this cause, would affect your conclusions, if at all?

Ans. For reasons fully set forth by Professor Cross in his testimony, with which I have already stated my substantial agreement, it is not possible to transmit articulate speech through any apparatus depending for its operation upon an interrupted, or "make-and-break" current of electricity. Consequently, under the statement of facts in the question, the apparatus through which the witnesses heard speech could not have been operated otherwise than by an undulatory current, and that apparatus, according to Professor Cross' views, must consequently have been, in that respect, substantially as set forth by Bell in his two patents in suit.

Though perhaps not called for by the question, I should like to add, that if the witnesses referred to could testify that they saw the wire running between the transmitting and receiving instruments nailed up against walls or turning corners in contact with the building, then it would not be necessary to include in the foregoing statement of facts any statement by the witnesses that said wires were, or that they were told they were, in an electric circuit; because such an arrangement of wire would bar out the possibility of the sound being mechanically transmitted along it, as is the case when a tense string, or wire connects the diaphragms of two of the so-called "lover's telephones;" these telephones, other than those using the undulatory electric current being the only ones which will transmit speech; and their operation depends, as I have indicated, upon the connecting string or wire being perfectly free to be moved mechanically by the vibrations of a diaphragm.

Q. 62. Professor Bell has somewhere indicated his opinion that the quality, or timbre, of sound is ultimately resolvable into the two elements of loudness and pitch, or, speaking with reference to the sound vibrations, into the two elements of amplitude and frequency. Have you considered this subject; if so, what is your opinion upon it, and what your reasons therefor, and what practical bearing has the matter, if any, upon the questions here involved?

Ans. I have already testified in an answer hitherto given, that in his patent of March 7th, 1876, Mr. Bell has stated that the instrument described therein is capable of reproducing sounds in both their characteristics of loudness and pitch. And I have also stated, that when Mr. Bell contrived an apparatus having these capabilities, he accomplished a material advance in the art. I also said, in substance, that, in my opinion, Mr. Bell intentionally left out of his patent of March 7th, 1876, any statement or indication that his apparatus would transmit the timbre or quality of sound, apparently leaving such a contrivance to be described in operative form in the later of the two patents now in suit. Now, if Mr. Bell's statement that quality is resolvable into the elements of loudness and pitch (and that statement will be found on page 19 of Mr. Bell's affidavit, attached to Complainant's moving papers for a preliminary injunction in this case; and also, I believe, in his testimony, as the question states), is to be taken as true in its application to the speaking telephone, then it seems to me that his assertion could be made into a convenient peg on which to hang the conclusion that if the instrument set forth in Bell's patent of March 7th, 1876, would transmit what Mr. Bell thinks are the elements of quality, therefore it could transmit quality itself. Looked at in this way, it will be seen that Mr. Bell's statement, made long after he had obtained his patent in March, 1876, might easily be twisted into a bearing on this case which would lead the Court astray, even if that object were wholly unintentional.

It will be found, I think in Professor Cross' testimony, that he himself speaks of quality as an "element" of sound; and as the word "element" simply means something that cannot be resolved into constituent parts, his very use of the term negatives his idea of its resolution. Neither do I gather from Professor Cross' testimony that he accords with Professor Bell in the view above stated; but on the contrary he takes considerable pains to point out, and I think does so with much ability, that pitch is one thing, loudness another, and quality another—all three different.

The difficulty in the application of Professor Bell's statement to the terms of his patent, as I have pointed out, (and it is just here I think that error is likely to be inadvertently made), lies in the fact that, regarded in one sense, (and that an exceedingly broad and general one), as I shall point out, Professor Bell's assertion involves some truth; whereas, in its application to the subject matter of this case, namely, the telephone as an instrument for transmitting articulate speech, I don't think it is true.

To illustrate: The position of any point on a plane can always be described by stating its distance from each two lines drawn at right angles to each other in that plane; so for any number of points; and so for any curve or any figure that can be drawn. Now, when we undertake to represent graphically sound-waves by curves, as Professor Bell does in his patent of March 7th, 1876, and as Professor Cross does in his answer to interrogatory 8, in Complainant's *prima facie* case, it is quite true, as Professor Cross sets forth, that by measurements along a vertical and a horizontal axis, the portion of any point on that curve may be determined; that is to say, as he expresses it, by determining for each point the length of the abscissa and of the ordinate for that point. Now this is true of any curve; so that, even if the form of the curve were varied so as to include an almost infinite number of sinuosities, it still would be mathematically possible to lay down the position of every point in it, in the matter stated. Consequently, if we take the position of a point measured from one axis to represent pitch, and from the other to represent loudness, then we can refer every point in the curve to the elements of pitch and loudness, no matter how the position of the points may be caused or varied.

In this sense it would be possible still, as Professor Cross indicates, to take a curve, such as shown in the diagram of his answer to interrogatory 9, and which he states represents the motion of a particle under the influence of sound-waves, and which, in addition to showing pitch and loudness, also shows quality by its peculiar form, and fixes the position of every point thereon by measurement in two directions, one of which we have agreed shall represent pitch, and the other loudness. That is to say, we can handle the subject theoretically in that way, in pretty much the same way that we can handle vast quantities through the aid of algebraic symbols, or indulge in the scientific use of the imagination to reach conclusions which we never could attain through any course of physical experimenting. The difficulty of this mode of procedure often lies in our mistaking the symbols for the things, and assuming that what is true intrinsically of the symbols is equally true of what they represent. This is the error which Professor Bell has apparently fallen into, or at least, it is only by assuming that to be the fact that I can find substantial foundation for his statement above quoted.

Now, if I understand the question before me correctly, it is not whether Mr. Bell or anybody else can show theoretically, by graphic representations of sound-curves, that the changes in form due to quality can be described by reference to distances taken to represent pitch and loudness; but whether an instrument, which is capable of transmitting pitch and loudness, is by reason thereof, practically able to transmit quality also. Theories in physics are one thing, and facts are another, and there is scarcely a theory that has not been turned upside down in the last two centuries. They are only valuable so far as they account for most of the observed phenomena, and modern scientific reasoning is inductive from facts, and not deductive from theories. If there is any department of physics in which theories are likely to go astray, it is electricity; and the more cautious and careful any one is in explaining the why and wherefore of electrical phenomena, save by the rigid answer of actual experiment, the less likely is he to be obliged to revise his theories afterwards.

I have already stated in answers to previous questions that I can see no reason why, if Professor Bell thought that his instrument would transmit quality, he did not state as much in his patent, instead of leaving it to inference; or why, in a curve which he shows and states to represent without error the vibration of a body capable of inductive action, he could not have put in or indicated some changes in form to represent quality; more especially, in view of Professor Cross' statement, that "the variations between the sound-waves which constitute a given articulate sound, and those which constitute a sound not recognizable as articulate speech, are such, that an excessively minute departure from the theoretical requirements will substantially deprive the instrument of all practical value."

The quality which Professor Bell undertook to transmit is stated to be the quality of articulate speech. In an instrument of comparatively gross construction, it appears that he found he could transmit pitch and loudness, and this instrument, which is represented in figure 5 of his patent of March 7th, 1876, I do not understand Professor Cross to assert would transmit quality of speech. According to Professor Bell, it should do so, because it transmits pitch and loudness. Professor Cross confines himself substantially in his testimony to the apparatus shown in figure 7, and in the difference between that apparatus and the one shown in figure 5 of the same patent resides, he substantially says, its capability of transmitting speech. I leave Professors Bell and Cross to reconcile their opposing views as best they can, the one virtually asserting that his instrument can transmit quality, and hence inferentially, articulate speech, because it transmits pitch and loudness; and the other, that the specific apparatus he refers to in his testimony transmits articulate speech, because of its specific differences from the contrivance which Professor Bell substantially asserts is already capable of doing so. I have simply to point out, that the particular apparatus set forth in Bell's patent of March 7th, 1876, and referred to by Professor Cross, will not transmit anything, when made in accordance with what is set forth in the patent.

[*Complainant's counsel objects to the answer, as containing a misrepresentation of the testimony on behalf of the Complainants, and further objects to the answer as immaterial, because based on a misrepresentation of the evidence for the Complainants.*]

Adjourned until March 16th, 1882, at half-past ten o'clock, A. M.

March 16*th*, 1882, 10:30 o'clock, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

[*Examination of Mr. Park Benjamin by Mr. Hill continued.*]

[*Counsel for Defendants states that the witness has not intended to misrepresent the statement of Professor Bell, as is shown by the fact that he refers to his testimony, to the volume and page where Professor Bell's own language can be read; and the fact that the Defendants' expert and the Complainants' counsel seem to understand Professor Bell differently shows the propriety of directing the attention of the Court to the somewhat ambiguous or obscure nature of his statement.*

Complainants' counsel objects that the allegation of Defendants' counsel that Mr. Bell's statement referred to is ambiguous or obscure, is not evidence in the case, and not proper to go on the record.]

Q. 63. Then, if I understand you correctly, your opinion is, that even if theoretically, the different points assumed by a particle of air in the course of a sound-vibration might be graphically represented in terms of loudness and pitch only, yet it does not follow that an instrument capable of transmitting or reproducing only loudness and pitch would be necessarily capable of transmitting or reproducing articulate speech; is my understanding correct?

Ans. Yes; there are a great many other things that can be proved and realized theoretically, but which are not open, so far as we now know, to practical mechanical demonstration. To illustrate; I can measure the diameter of this ink-stand with a foot-rule, but when it comes to measuring the diameter of a molecule of matter, although the molecule is just as much of a physical entity as the ink-stand, there is no measuring instrument in creation by which I can do it. And yet the size of molecules has been measured theoretically, and Sir William Thomson fixes their thickness between one-two hundred and fifty millionth and one-five billionth of an inch. The capabilities of mechanical apparatus are very limited, and when such apparatus is called upon to deal with the very minute in nature, very slight causes are apt to render it wholly inoperative. Professor Cross has pointed out very fully the delicate, and almost infinitesimal nature of the vibrations that go to determine the quality of a sound; and hence, it seems clear to me, that while an instrument might transmit the comparatively gross characteristics of pitch and loudness, it might, by its very construction, be incapable of also transmitting the delicate characteristic of quality; so that when that instrument is described presumably in a manner which will enable other persons to make it, it seems to me that if it is intended to transmit quality, both the facts should be so distinctly stated, and the construction of the instrument accurately shown. And if this is true of the transmission of quality in general, it is certain with regard to the transmission of a particular kind of, and exceedingly subtle quality, namely, that which characterizes articulate speech.

Q. 64. What opportunities have you had during the last four months, for becoming personally acquainted with Daniel Drawbaugh, and for knowing the extent of his literary and mechanical acquirements?

Ans. During the last four months I have resided in Harrisburg, Pennsylvania, for about two-thirds of the time, and during this period I have had almost daily opportunity of conversing with him at considerable length regarding his inventions, not merely for the purpose of enabling me to testify intelligently here, but to gratify my own curiosity; for I think I can safely state, that there is no parallel instance in the whole history of invention, at least so far as I know it, of any one having accomplished a more brilliant and extraordinary series of original discoveries.

[*Answer objected to by Mr. Storrow as incompetent and in every way improper.*]

Q. 65. What do you think of his qualifications as a solicitor of patents?

[*Objected to by Mr. Storrow as incompetent.*]

Ans. Mr. Drawbaugh has very little book-learning. Judging from his conversation, his command of language is very little; and I should regard it as wholly inadequate to enable him to use the exact and precise terms necessary in a patent specification. As I have already testified that I heard Mr. Drawbaugh give nearly all his evidence, it is perhaps proper for me to add, that he dictated the mechanical descriptions, which appear therein, apparently with much difficulty; and that he was frequently assisted during his direct examination in the formation of his sentences, and in choosing terms of expression, by both Complainants' and Defendants' counsel, and by myself. This occurred to the greatest extent in his descriptions of the more complicated machines, "J," "H," and "P." It should be understood that this aid did in nowise extend to varying the meaning of his statements in regard to the instruments, but simply to supplying deficiencies in grammatical construction, and logical connection.

I think Mr. Drawbaugh is capable of conveying his ideas to another person, although he does it in a disjointed way, running rapidly from one subject to another; so that it is by no means easy to gather his thoughts in their logical connection. But from all I have learned from him, I do not believe that he could properly write a patent specification.

[*Defendants' counsel offers in evidence the following articles referred to by the witness in his direct examination:*

The articles from "The Manufacturer and Builder," a newspaper published in New York City, for May, 1869, *Volume* 1, *No.* 5, *pages* 129, 130.

Also an article from the "Scientific American," for Sept. 9*th*, 1876, *Volume* 35, *new series, No.* 11, *said article commencing on page* 163, *and ending on page* 164.

Defendants' counsel also states, that at one time, he thinks about July, 1880, *some of the Drawbaugh instruments, and parts of some, were photographed, and possibly one of the reproduced instruments, but whether the* *one here in evidence or not counsel does not now remember. He puts in evidence a set of these photographs, and they are marked "Exhibit Photographs;" and each sheet is marked with letters designating the instruments from which the photographs are taken.*

These photographs were taken at Washington, D. C., and are only of such instruments as happened to be down there at the time.]

Cross-examined by Mr. Storrow.

Cross-Q. 66. When did you cease to be connected with the *Scientific American*?

Ans. In July, 1878.

Cross-Q. 67. In your 21st answer, you said, that in referring to the state of the art, you did not take into consideration what Mr. Drawbaugh is alleged to have done. You also added another limitation. In view of that second limitation, I wish to know whether, in referring to the state of the art, in your testimony, you have intended to limit it to what you personally knew, or have you intended by that phrase to refer to what is generally understood by the term "state of the art," excluding Mr. Drawbaugh, of course?

Ans. I understand the term "state of the art" to mean, such information as is open to the public, either in prior patents, or printed prior publications, and possibly in the proved statements of individuals, who may have testified in courts of law, as to their own particular labors or discoveries in the art, which statements have been passed upon and accepted in judicial decisions. I do not mean to say that I knew all which any one might gather from these sources, for I had not then made, and, as I have already testified, I have not since made, a protracted examination which would doubtless be necessary to consult them all. I referred to certain apparatus, of which I had knowledge, partly derived from seeing the apparatus itself and partly from printed descriptions of the same, at the date of Bell's patent of March 7th, 1876. I did not mean to say that that was all I knew of the state of the art at that time; because I do not think that I could now specify the full extent of the knowledge I then had. I merely mentioned certain contrivances, that came uppermost in my mind, as pertinent to the subject under consideration, and of which I fully believe I had knowledge at the period mentioned.

Cross-Q. 68. You have stated in your deposition various conclusions you have arrived at; you have also stated certain experiments, tests and trials; if those conclusions are based upon any experiments, tests or trials, other than those so specified, I wish you would state what they were, and when and where they were performed?

A. Such conclusions as I have stated to be based upon trials or tests made by me, were actually founded upon the trials or tests mentioned, and not, so far as I now recall them, upon other trials or tests not referred to, and this is the idea which I intended to convey in my testimony.

Cross-Q. 69. If any of the conclusions stated, and which you did not in terms connect with any particular trials or tests, were in fact founded on or supported by any tests, trials or experiments, please state what such tests, trials or experiments were, and when and where they were made?

A. To answer that question accurately, according to the general terms in which it is framed, I shall be obliged to read the records of an enormous amount of experimenting made by the great discoverers in physical science, on which experiments were mainly founded the conclusions which they reached, many of which have been restated, both by Professor Cross and myself; and it is simply impossible for me to name all such tests or experiments, or to say when and where they were made. As I do not suppose that this is at all the intention of counsel, I trust that he will limit his question in some way, either to tests made by me, or by particular persons, in which case I shall endeavor to answer it as fully as possible.

Cross-Q. 70. Please answer the last question, limiting yourself to experiments made by you or in your presence, during the last two years?

A. I have not made any experiments, except those mentioned in my testimony, with telephones during the last two years, although I have repeatedly talked through such instruments, and incidentally remarked their efficiency, said instruments being in connection with organized systems. I have made a large number of experiments, mainly repetitions of those made by others, in order to fix electrical principles in my mind; and I suppose that these experiments have indirectly affected my conclusions. I cannot specify them all, nor their number; perhaps it will suffice to state, that they were all old and well known, and that they involved no original discovery on my part. I do not recollect having seen any experiments made by others, during the period mentioned, which have had any effect upon the conclusions I have stated.

Cross-Q. 71. If the conclusions you have stated are based upon any experiments with telephones not already mentioned, and made more than two years ago, please state what those experiments were, and when and where they were made?

A. I understand this question to be limited to experiments made by me or in my presence, as before. Perhaps it may save some further questioning in this direction if I state right here that I have neither had the time nor opportunity to enter into any elaborate series of experiments or tests with telephones at any period of my life, as I think may be easily inferred from the statements I have made as to my employment for many years back. The conclusions which I have stated to be based on an early test of Bell's telephone, made by me, I think in 1877, were based on that test and not on any other. I believe I have not mentioned, hitherto, that when I heard Professor Bell lecture in this city in 1877, I saw him then make a number of experiments with with the telephone, the results of which of course fixed themselves in my mind. I cannot now recall other experiments which I may have seen in public, though I have an impression that I did see some, but I don't think they affected any essential conclusion of mine about the telephone, formed either before or since.

Recess for lunch.

March 16th, 1882, 2 P. M.

Examination resumed.

Present same counsel.

Cross-Q. 72. You have referred to Professor Cross' testimony, and stated that you agree with some parts and disagree with others, but have not specifically pointed out the pages and paragraphs referred to. I understand, however, that you agree with him as to what takes place in a speaking telephone whilst transmitting speech; and that you agree with him as to what necessarily must take place in order that articulate speech may be transmitted; but that you disagree with him upon the question whether those things are found in Mr. Bell's first patent, and will be performed by the instruments therein described. Am I correct in that? As an illustration of my understanding, I refer you to the first paragraph of Professor Cross' answer 18, page 36.

A. I dislike to criticise counsel's questions, but the first part of this one clearly refers to theory and mode of operation, and the second part to "things" which Professor Cross finds in the apparatus; so that I am left in some doubt as to the meaning. I will endeavor however, to answer as definitely as I can, by stating that I have agreed with Professor Cross, first, in his general explanation of the theory of sound and its characteristics, including the assertion that quality is an element of sound; second, in his statement of how undulatory currents are produced in the telephone, which is right so far as it goes; third, in his opinion that no telephonic apparatus can transmit speech by electricity over a wire, unless it be based upon the use of the undulatory current of electricity, thus excluding any contrivance depending for its operation upon the "make-and-break" or interrupted current.

I do not agree with him in the opinion that there is described in Bell's patent of March 7th, 1876, in operative form, a telephone which will transmit speech through the medium of the undulatory current, either when the latter is produced by variations in the electro-motive force of, or in the resistance offered to, the current.

Referring now to the paragraph which has been specifically called to my attention, and assuming that by the instrument he mentions Professor Cross means the one represented in figure 7, of Bell's patent noted, (I assume this, subject to correction by Complainant's counsel), I find therein, as Professor Cross does, a line-wire and a battery connecting two instruments, which instruments I find by experiment, when connected with wire and battery, are not operative speaking telephones, and therefore I do not agree with Professor Cross in his statement of the functions of said instruments, or that they are in fact respectively a telephone receiver and transmitter. I agree with Professor Cross in his statement in the paragraph referred to, that the instrument which erroneously, I think, he calls a transmitter, contains a movable part which is capable of being set in vibration by the agency of the voice, but I do not agree with Professor Cross in his statement that said movable part is so arranged that it shall cause electrical variations in the current traversing the line-wire; because I have shown by experiment that it is not so arranged. If I have not answered the question as categorically as Defendant's counsel may desire, I offer to go over the whole of Professor Cross' testimony, and state my agreement or disagreement with every assertion he makes or opinion which he presents.

Cross-Q. 73. Will you now assume that in the first paragraph of his 18th answer, Professor Cross referred to a speaking telephone apparatus which you knew was operative, and not to the one which you say was

ELEPHONE COMPANY,-2

inoperative; and state whether the paragraph, upon that assumption, would correctly describe the operation and the essential parts of the operation, which an operative speaking telephone would perform in the transmission of speech?

Ans. That assumption necessarily involves, first, the conclusion that the apparatus I am to assume is not set forth in Bell's patent of March 7th, 1876, because Professor Cross' statement, to which I am referred, particularly relates to that patent, which is mentioned in the very first words of the paragraph as the one in which he finds the apparatus operating as he describes; and second, that in conceiving such an operative apparatus I must use knowledge acquired since the date of the aforesaid patent; because, under Complainant's own showing, knowledge of an operative speaking telephone did not exist before. With the foregoing understood, I can assume a transmitting instrument suitably constructed to operate as set forth by Professor Cross; also a receiver so operating; also a battery and a line-wire, the instrument transmitting and receiving speech by the medium of the undulatory current of electricity. This, however, merely amounts to re-affirming my argument with Professor Cross, as stated in my preceding answer, and involves the addition to the apparatus shown in figure 7 of Bell's patent of March 7th, 1876, of another invention. I see no escape from the conclusion as I have stated it, as otherwise I should merely be asked to assume as operative an instrument which I knew to be inoperative, and thence to be landed in the logical absurdity of saying that Professor Cross describes an operative apparatus; because, for him to do different would be contrary to the assumption.

Cross-Q. 74. Would the instruments in ordinary commercial use, on the telephone exchange, in New York, such as the Blake transmitter and the hand telephone magneto receiver, of the "butter-stamp" form, satisfy the assumptions of your last answer?

Ans. The assumption called for in the last answer, was simply of an operative instrument; and as they are operative instruments, the Blake transmitter and the Bell "butter-stamp" telephone, would satisfy that assumption; if the assumption includes, also, the operation of the instrument, by the undulatory current, and the vibration of the diaphragm of the receiver thereby, to reproduce speech, they would still be within the assumption, but neither of the devices are made only from what is shown in Bell's patent of March 7th, 1876, and both of them are operative instruments, by reason of later inventions contained in them.

Cross-Q. 74½. I call your attention to your thirteenth question and answer, and ask you whether, in your opinion, your article in the *Scientific American* of March 31st, 1877, was suited to convey to the public intelligible information, upon the subject of the electrical transmission of speech, and the operation of the instruments therein described?

Ans. That article was based mainly upon the statements made by Mr. Bell, in his patent of January 30th, 1877, from which patent the illustrations, figure 2, 3 and 4, in said article were copied, almost in *fac simile.* The drawings of Professor Bell lecturing, were obtained from an artist correspondent, and the statements contained in the article, not derived from Bell's patent, were gathered, I think, from reports of other journals. The matter was assumed to be correct at the time, and it is not the practice in newspaper offices to require that the information they receive shall be verified by affidavit. I simply made up the article in the ordinary course of editorial work, and it was published as something of public interest, and not as opinions of mine based on my personal knowledge. If counsel means to call attention to the fact that this article sets forth Professor Bell as an inventor of the speaking telephone, and to show thereby, that I publicly stated that to be my belief, I can show him a good many later articles, where I say the same thing, on my own responsibility, and not on the responsibility of the *Scientific American*, because I always supposed Professor Bell was the first inventor of the speaking telephone, until I found out, during the progress of this suit, what Drawbaugh had done in the same line.

[*Reference to Mr. Drawbaugh is objected to by Mr. Storrow, as improper to come from an expert.*]

Cross-Q. 75. Was that article suited to convey to the public a substantially intelligible idea of the operations which take place in the electrical transmission of speech, and of the operation of the instruments therein described?

Ans. It was intended to, and does in fact, give only a general idea of the subject, which is right enough, so far as it goes. The details of the instrument are not described with any particularity, nor is the influence of the several parts of the instrument upon its operation fully stated. Besides, I remember now, that the instrument was sent to the office, strapped up in a box, as represented in the picture, with a request that it should not be opened, and that is why the Patent Office drawings were copied, and the engravings of the inclosed instrument, not directly made from the instrument itself; and this fact, of course, although I could determine the presence of many parts in the instrument, to be as shown in the patent, prevented my giving as graphic a description of it as I might otherwise, perhaps have done.

[*Complainants' counsel puts in evidence said article, to be marked* "*Park Benjamin's Scientific American article, March* 31, 1877."

Cross-Q. 76. You have spoken, in your 15th answer, and in a number of other places, of the "undulatory current," with reference to the action of the speaking telephone. I understand from Professor Cross' testimony, that for the purpose of transmitting articulation or quality, it is necessary, not only that the current should be undulatory, as distinguished from intermittent, but that the electrical undulations should correspond in their form to the aerial undulations or vibrations, which constitute the sound to be transmitted. Do you, or do you not, agree with him in that respect, and have you intended to use the phrase in that sense, when referring to the electrical transmission of speech, by such a current?

Ans. As I understand the question, I agree with Professor Cross, in the statement therein; and I have used the phrase in the sense indicated.

Cross-Q. 77. Near the end of your 16th answer, in summing up your conclusions, you say; "I do not find, for the reasons stated, in Bell's patent of March 7th, 1876, a speaking telephone, either directly or by inference from the language used, or from the drawings." Do you mean to be understood as saying, that from merely reading the patent, and without knowing from actual trial, whether the instruments therein described are, or are not, practically operative, you have come to the conclusion that no electric speaking telephone is there set forth?

Ans. I continue the quotation, from the point where the counsel left off; "And I have determined to my satisfaction, by actual test, that the specific apparatus, which the Complainant has sought to prove, as a speaking telephone, is wholly inoperative as such;" and I emphatically protest against the counsel carving out pieces of sentences from my testimony, and attempting to mislead the Court, by giving them a signification completely negatived by the immediate context. The sentence which I complete, in answer, is quoted from my long reply, setting forth what I find in Bell's patent of March 7, 1876. I gave in that reply all my reasons for the conclusions reached; and I stated in conclusion, that I based my opinion apparently on all the foundation on which an opinion could be based, namely; the language of the specification, the drawings, and the actual test of the instrument; and I don't think I have anywhere given it to be understood, that I have allowed myself to be influenced, other than by fair consideration of all three of these means of knowledge.

[*Answer objected to by Mr. Storrow, as irresponsive and improper.*]

Cross-Q. 78. Have you meant to express the opinion, or have you expressed the opinion, in your deposition, that examining the specification and drawings, of that patent alone, would properly lead an expert to the conclusion, that no electrical speaking telephone is therein set forth?

Ans. I have said, and I still say, that Bell's patent of March 7th, 1876, specification and drawings, do not, in my belief, describe an operative electrical speaking telephone. That conclusion, I think, can be fairly reached from the specifications and drawings. But as against this conclusion, I have the opposite statement of Prof. Cross before me. Desiring to give that witness' statements all the weight possible, and at the same time to test the accuracy of my own conclusion in the matter, I had an apparatus made, fairly and honestly, in accordance with what is set forth in figure 7, of Bell's patent. The result of the experiment with this instrument, was not only to confirm my conclusions, but also to prove to me that Mr. Bell had not even indicated in his patent how to make an operative speaking telephone. And thus, taking the results of my test, and all that is set forth in the patent, together, as I have intended these matters should be taken, I fail to see how, under the broadest construction that can be given to his patent, Mr. Bell can be considered to have described an operative speaking telephone therein.

Cross-Q. 79. I understand from your last answer, that the reason why you think that patent does not set forth an electric speaking telephone is, because you think that instruments constructed as therein described could not transmit speech, and that you form that opinion, first, from examining the specifications and drawings, with your knowledge as an expert; and second, from actual tests or trial with the instruments you have produced. Is my understanding correct, and if not, please state wherein it is wrong?

Ans. It is right, so far as it goes; but all the reasons influencing me on the subject have been fully set out by me in my direct testimony, and notably, in answer to question 16.

Cross-Q. 80. Suppose you had found on trial, that instruments made according to the specification and drawing did transmit speech, what conclusion should you then have arrived at, as to whether that patent did, or did not set forth the invention of a speaking telephone?

Ans. If I found that an instrument made in accordance with what is set forth in that patent was, in fact, an operative speaking telephone, then I think it would be for the Court to say whether the description of the patent was legally sufficient. It would be one of those cases, I think, closely analogous to that in which a new use is discovered for a patented apparatus, never thought of by the inventor, and not specifically stated in his patent, but which he would nevertheless be entitled to the benefit of.

Adjourned until Monday, March 20th, 1882, at half-past ten, A. M.

March 20th, 1882, 11, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for Complainants, and Mr. Hill for Respondents.

Cross-examination of Mr. Park Benjamin by Mr. Hill continued.

Cross-Q. 81. Did you write an article in the *Scientific American* of October 6th, 1877, volume 37, pages 207 and 212, relating to the telephone; and, if so, state whether that was suited to convey a correct and intelligible idea to the public, so far as it went?

Ans. I don't think I wrote that article.

Cross-Q. 82. Do you think that article suited to convey a correct and intelligible idea to the public, so far as it went?

Ans. Yes; I think so.

Cross-Q. 83. In your twenty-second answer, you briefly summarize your opinion of the improvement set forth in Mr. Bell's first patent, March 7, 1876, and of the further improvement contained in the invention patented by his second patent, January 30, 1877. I understand you to say therein that the most important difference between them is, that, in your opinion, the second patent tells the community how to make an electric speaking telephone, and the first does not; do I understand you correctly in these respects?

Ans. The second patent describes an operative speaking telephone, and the first does not.

Cross-Q. 84. Will you tell me what is the difference in the construction of the instruments described in these two patents, respectively, which makes the one described in the second patent an operative speaking telephone, and leaves the one described in the first patent, in your opinion, not an operative speaking telephone?

Ans. I understand from the question, that I am to explain, first, why Bell's first device is, in my opinion, inoperative; and then show why the second device is operative, and point out the differences which lead to that result. I have already given my reasons with regard to the inoperativeness of the device shown in Bell's patent of March 7th, 1876, based, as I have already stated in this cross examination, on my study of the patent, and on the tests I have made. These reasons I need not now repeat; but, as under the question, I think it necessary for me to state all the reasons which I have for regarding the device shown in Bell's patent of March 7th, 1876, as inoperative, I have now to mention some which I have not before stated.

It is proper for me to explain here that, in view of the assumptions which I have been called upon to make during this cross-examination, to the effect that Bell's device of March 7th, 1876, is an operative contrivance, I have been led, during the late adjournment, carefully to examine the testimony of Professor Bell and Mr. T. A. Watson, stipulated into this suit, in order to discover whether I could find anything therein which would afford a substantial basis for the assumptions before referred to. I had looked over this testimony before, in order to seek out its affirmance or disaffirmance regarding other considerations which have occurred to me, but this was the first time that I had carefully examined it fully, in order to see what Professor Bell thought of the contrivance which he represented in his earlier patent. Professor Bell, in his answer to the 71st interrogatory, describes certain experiments made on June 2nd, 1875, in which he found, as he states in a letter of that date, written by him to Mr. G. G. Hubbard, and quoted by him in answer to interrogatory 7th, that he could transmit signals without any battery whatever, and that, "the musical note produced at the receiving end was sensibly the equivalent of that at the transmitting end, in *loudness* as well pitch." The italics are Professor Bell's. On the same date, as he says in his answer to the 74th interrogatory, he instructed Mr. Watson to make a membrane instrument; and Mr. Watson says, in his deposition in the interference, which has been put in evidence by Complainants', in answer to interrogatory 8, that the instrument he made according to said direction, is shown in the engraving embodied in his answer, which engraving is the same as that representing "Complainants' exhibit No. 31, Bell's Telephone of 1875."

On July 1st, 1876, Professor Bell, in answer to his 84th interrogatory, says that he ordered a second membrane telephone constructed, a duplicate of which he produces, which is marked "Complainants' exhibit No. 34." In his answer to interrogatory 20, Mr. T. A. Watson, who furnished these two instruments, says as follows: "They are duplicates with the following exceptions: In exhibit 31 the wooden framework is a little heavier, and the armature not so thick. In exhibit 34 the framework is heavier, armature thinner, and a different method for adjusting the differences between the pole of the magnet and armature is supplied. In the original the adjustment was made by sliding the crossbar that supported the magnet up and down in the slots in the sides, as in exhibit 31."

After testing these instruments, Professor Bell says, in his answer to interrogatory 92, that the "experiments demonstrated the practicability of transmitting articulate speech by instruments having the same mode of operation as these stretched membrane instruments," and that it was only necessary to make further experiments, to ascertain the best arrangement of the parts; and from the account of the test, given by Mr. Bell in his answer to the 90th interrogatory, I do not find it stated that articulate speech was heard through the apparatus, but that Mr. Watson had stated, that he (Watson) had heard Bell speaking, but could not make out what he said.

In his answer to the 94th interrogatory, Professor Bell sets forth a letter written by him, wherein he states what he wants to protect in his patent, and speaking apparently of the transmission of speech as something to be done in the future.

So far as I, therefore, have been able to learn from Mr. Bell's testimony, he had now constructed two instruments, a receiver and a transmitter, through which Mr. Watson had stated that he had heard the sound of the human voice. Mr. Watson himself on this point, in answer to the 13th and 15th interrogatories, says that with the membrane telephone alone as a transmitter he could hear a faint sound; that with the two membrane telephones the results were a slight improvement, but that his "recollection of this experiment is confused with those that precede." In September, 1875, Mr. Bell, it appears, went to Canada, and while there he made a drawing which is put in evidence by Complainants in this case, "Exhibit 37, Bell's Toronto Drawing," and in answer to the 129th interrogatory, Professor Bell swears, that the paper shows "the invention and apparatus described in my United States patent dated March 7th, 1876." In answer to the 126th interrogatory, he says that he made the drawing on the 28th day of December, 1875. In this drawing I find a sketch representing an apparatus, such as is shown in figure 7 of Bell's patent of March 7th, 1876, beneath which is written the following: "First attempt to transmit the human voice. The varying pitch of the voice could be discriminated, but not the quality. A sort of muttering effect was perceived at the receiving end when a person talked very loudly at the other end."

In his answer to the 101st interrogatory Mr. Bell says that he began to prepare the specification of his patent of March 7th, 1876, in September, 1875, and produces sheets containing rough drafts, made in October. So that this statement on the Toronto drawing was apparently penned by him after he had drawn his specification. I have already pointed out, in my direct testimony, that in the drafts of claims referred to by Mr. Bell in answer to the 103rd interrogatory, are claims for transmitting sounds differing in *timbre*, as well as pitch and loudness, which claims do not appear in Bell's patent of March 7th, 1876.

Finally, with regard to the specification which he did prepare, he says in answer to the 115th interrogatory, that on the 18th of January, 1876, after he had sent his specification to a solicitor in Washington, he wrote a letter in which he quotes Mr. Hubbard as being pleased with that specification, and as stating that, "it promises to be of great value if I (Bell) *prosecute my researches diligently*; if not, others may supplant me." The italics are Professor Bell's. The conclusion which I reach from all the foregoing, I think, entirely confirms the conclusion I have already attained in a wholly different way. I said that I believed that Professor Bell had left out reference to transmission of quality of sound in his patent of March 7th, 1876, purposely; and this is confirmed by Professor Bell's own statement, on the Toronto drawing, that the only apparatus, shown in that patent, which Professor Cross says will transmit quality, will in fact not do it. It is also confirmed by the fact of Bell's having made this statement after drafting the claims for his patent, as he quotes them, said claims including some for the transmission of quality, which claims he omitted in his specification of a patent signed twenty-two days after making the Toronto drawing, which specification, two days before he signed it, he thought described an invention which promised "to be of great value," if he prosecuted his "researches diligently."

Referring now once more to Bell's two membrane instruments, Complainants' exhibits 31 and 34, which, in their original form, do not, so far as I can discover, appear to have transmitted articulate speech, although in their reproduced form some results of the sort seem to have been reached, the consideration of these in comparison with what is shown in figure 7 brings me directly to the comparison between Bell's two devices, and to pointing out the differences called for by the question. I have already quoted Mr. Watson's answer with regard to these two instruments, from which it will be seen that both of them are provided with means for adjusting the relative distance between magnet and armature; whereas, I have already pointed out that no such means are described or suggested in Bell's patent of March 7th, 1876, and that the same are claimed as an original invention by Bell in his patent of January 30th, 1877. I have already dwelt quite fully on the importance of this contrivance, as affecting the practical operation of a speaking telephone, and it now appears that Mr. Bell both knew of it and used it long before the date of his first patent. There was nothing to have prevented him indicating it in that patent, that I can discover, unless he considered, as he has sworn that he does, that in a system of multiple harmonic telegraphy, transmission of quality as well as pitch is of no advantage whatever, and hence that it was perfectly open to him to leave out a device which mainly tended towards the operativeness of the instrument as a transmitter of quality. The absence of the adjusting device from the contrivance shown in the patent of March 7th, 1876, and its presence in the contrivance shown in the patent of January 30th, 1877, is one difference which renders the latter operative while the former is not. In the instrument shown in the patent of March 7th, 1876, the armature is hinged to the uncovered leg of the magnet, and connected in some unknown way to the centre of the diaphragm. This arrangement doesn't appear to have proved satisfactory, especially with a heavy armature; and at all events, in the lecture delivered before the Society of Telegraphic Engineers by Professor Bell, in October, 1877, and referred to by him in answers to interrogatories 174 to 180, he says, that with the two membrane telephones, complainants' exhibits 31 and 34, the results were only "partially successful," and that he determined to reduce the size and weight of the spring as much as possible. For this purpose, he says: "I glued a piece of clock-spring, about the size and shape of my thumb-nail, firmly to the centre of the diaphragm," and after this he was "enabled to obtain distinctly audible effects." In answer to the 180th interrogatory, however, Professor Bell says that he applied this clock-spring after the granting of his patent of March 7th, 1876.

Recess for lunch.

March 20, 1882, 2, P. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Mr. Park Benjamin by Mr. Storrow continued:

[*Witness continues.*] The adoption of the thin piece of clock-spring glued to the centre of the membrane seems to have been the first step in the advance which was consummated in the adoption of a metallic plate. By the use of that plate Bell was enabled to suppress the separate armature and membrane, and by employing a substance unaffected by moisture and not liable to swell and become loosened, as does membrane under the influence of the breath, thereby, for this reason as well as for others already mentioned, he constructed an apparatus in a much more operative form. The use of this plate is the second point of difference between the two devices named in the question. The employment of the permanent magnet in the later device also tends to make it a more operative machine than the earlier contrivance, in which no permanent magnet was embodied.

And finally, in the device shown in the patent of January 30th, 1877, are combined a number of instrumentalities, not combined in like manner in the earlier device, the special arrangement of which tends to make the instrument more operative and better adapted for practical use.

[*Complainants' counsel objects, that an argument, which is attempted to be founded on the evidence, and which has been prepared in the manner and at the time stated in the answer, was not called for by the question.*

Defendants' counsel calls attention to the fact that the so-called argument is merely a series of qoutations from the testimony of Complainants' two principal witnesses, Mr. Bell and Mr. Watson, tending to show what *was and what was not, accomplished, as a matter of fact, by the instruments referred to in the question, and enabling him not only to indicate more clearly why the instruments shown in figure 7 of Bell's first patent would not operate for the transmission of articulate speech, but also enabling him to point out more clearly what the changes were that enabled it to transmit speech, and that they were made after the date of the first patent, and therefore were necessarily included in the second patent, all of which Defendants' counsel submits comes within the proper scope of an answer to the question.*

Complainants' counsel objects, that the arguments of counsel cannot properly form part of the record of the evidence in the case.]

Cross-Q. 85. I call your attention to the two instruments which you have produced, and which are marked "Defendants' Exhibit Bell Telephone, 1876 Patent." Will you please measure, as carefully as you can, and tell me the distance between the centre of the core of each electromagnet and the centre of the armature?

Ans. The distance is about one-eighth of an inch in the receiver, and about three thirty-seconds in the transmitter, as the instruments now are.

Cross-Q. 86. Are they different from what they were when you used them, in this respect?

Ans. No; the instruments are in the same condition as when I used them, except that the studs have become detached from the membrane, and possibly more fastening cement may remain in one instrument than in another. I merely mention this because it may tend to account, possibly, for the difference in the measurement of the distances mentioned.

Cross-Q. 87. Will you please measure and state the length, breadth and thickness of each armature?

Ans. Length, one and a half inches in both; thickness, three thirty-seconds inches; width, a half inch in both.

Cross-Q. 88. Please state what passages of the testimony of Professor Bell and Professor Cross you referred to in your 62d answer?

Ans. For Mr. Bell's statement that quality is resolvable into the elements of loudness and pitch, see his answers to interrogatories 63 and 64, and his statement in his affidavit on page 19 of Complainants' moving papers, directly to this effect.

I understand Professor Cross to refer to quality as an element, in his affidavit in Complainants' moving papers, page 34, at top of page; also in his testimony, page 30, in answer to interrogatory 9. Professor Cross' statement quoted in my answer, and having reference to the very slight variations between the sound waves of inarticulate and articulate speech, is taken from his affidavit in Complainants' moving papers, page 27.

The statement that the instrument shown at A, figure 7, is a most essential mechanical modification of A, figure 5, but by reason of the entire change of structure from figure 7, it has become capable of transmitting vocal sounds of all kinds, including articulate speech, appears at the bottom of page 35, Professor Cross' affidavit in Complainants' moving papers for a preliminary injunction. Professor Cross' statement to the effect that pitch, quality and loudness are different things will be found chiefly in his answer to interrogatory 6, in his testimony, page 23, in which occurs the following paragraph:

"I have used the term 'quality or *timbre;*' quality is that peculiarity of a sound by which, independently of its pitch or loudness, we are enabled to determine the instrument by which the sound is produced; thus, for example, the note of a violin differs from the note of a flute in quality, even though the two are the same in pitch and loudness."

I believe these are all the statements of Professors Bell and Cross to which I have referred in the answer. I should have given the sources from which I derived them, while making that answer, if I had supposed that I would be charged with misrepresenting, as I afterwards was, by Complainants' counsel.

Cross-Q. 89. Will you please point out the sentences referred to in your last answer, either by reading them to the Examiner so that he can take them down, or by indicating the first and last words, or otherwise?

Ans. Read in connection with all of the answers to interrogatories 63 and 64 this sentence from Mr. Bell's letter of May 4th, 1875, as follows: "If this turns out to be the case, the oscillations of the current should correspond in amplitude, as well as in the rate of movement, to the vibrations of the string. One consequence would be that the *timbre* of a sound could be transmitted." Read also in this connection the following sentence from Bell's affidavit, page 19 of Complainants' moving papers: "Before this time I had perfectly satisfied myself that the true and only method for the telegraph is transmission of vocal sounds involved as its fundamental element, an apparatus which should transmit amplitude or intensity as well as pitch—for "quality," or *tim-*

bre, or articulation were ultimately resolvable into these two characteristics of vibration, &c., to be transmitted."

Professor Cross uses the word "elements" in the following sentence, page 30, of his testimony: "The entire 'form' or character of this curve can be determined and controlled, as already stated, by determining, or controlling for each point the length of the abscissa and of the ordinate for that point, or in other words, determining, or controlling the elements of time or frequency, amplitude or intensity, and direction; but it is obvious that it will require very many measurements of abscissas and ordinates to determine or control the 'form' of each complete set of vibrations." The language in the affidavit and testimony is the same. The reference to page 27 of Professor Cross' affidavit is fully quoted in my 62d direct answer. The reference to page 35, Professor Cross' affidavit, has been fully quoted in my direct testimony.

Cross-Q. 90. In the second paragraph of your 62d answer you say: "It will be found, I think, in Professor Cross' testimony, that he himself speaks of quality as an 'element' of sound, and as the word element simply means something that cannot be resolved into constituent parts, his very use of the term negatives the idea of its resolution." Will you please point out the passage in Professor Cross' testimony where he applies the term "element" to quality?

A. I have already quoted from Professor Cross as speaking of the "elements of time or frequency, amplitude or intensity, and direction." Read this in connection with what he states in his testimony, pages 22 and 23, especially at the top of page 23, and it seems to me to follow, as a matter of course, that for the words "time or frequency" the word "pitch" can be substituted; for the words "amplitude or intensity" the word "loudness" can be inserted; and the word "direction" similarly may be replaced by the word "quality." If that is not the logical meaning of what he says, I fail to understand what is, and I would be glad to consider any other signification which counsel may suggest.

Cross-Q. 91. In the passage which I have quoted from your 62d answer you say that Professor Cross "himself speaks of quality as an 'element' of sound," and you draw a conclusion from what you style "his very use of the term element." What I would like to have you do would be to point out and read the sentence in which he speaks of "quality" as an "element"?

A. In his answer to the 9th interrogatory Professor Cross produces a curve, which he says represents the motion of a particle under the influence of sound-waves; and he uses the word "element" in the following sentence: "The entire form or character of this curve can be determined and controlled, as already stated, by determining or controlling for each point the length of the abscissa and of the ordinate for that point, or in other words, determining or controlling the elements of time or frequency, amplitude or intensity, and direction; but it is obvious that it will require very many measurements of abscissas and ordinates to determine or control the 'form' of each complete set of vibrations." This is the sentence referred to in my previous answer.

Cross-Q. 92. In that sentence Professor Cross applies the word "element" to time or frequency, to amplitude or intensity, and direction; I wish you would point out where you find "his very use of the term '*element*' as applied to *quality*, because in your 62d answer you seem to attach some importance to the use which you said he made of that term, as applied to quality.

A. As I said in a preceding answer, the word "direction" in the foregoing quotation I think may be replaced by the word "quality;" and as to the importance which I applied to Professor Cross' statement in that respect, I am not aware that I stated that I regarded it of any special import, other than as corroborating what I take to be the general tenor of meaning of his statements with regard to the matter.

Cross-Q. 93. I wish you would read any passage from Professor Cross' testimony, wherein you find the words "element" and "quality" in the same sentence?

A. I have never said nor insinuated that the words "element" and "quality" were in the same sentence, and counsel knows it perfectly well. I have endeavored to give what I understand to be Professor Cross' meaning, and I have also stated fully the grounds of my understanding. If the counsel proposes to bar out all inferences in this case, and require specific statements for every fact, then he renders it certain that the speaking telephone is not described in Bell's patent of March 7th, 1876, because there is no statement whatever in that patent that any instrument there shown is capable of transmitting articulate speech.

[*Answer objected to by Mr. Storrow as not responsive.*]

Cross-Q. 94. Can you, in point of fact, find any sentence in Mr. Cross' testimony which contains both those two words, "element" and "quality"?

A. It would be just as reasonable to ask me whether I could find in Professor Cross' testimony two words in the same sentence in the Koptic language. I haven't said I could do this; neither have I said that I could find the words "element" and "quality" in the same sentence; and I can't.

[*All the answer, except the last two words, objected to by Mr. Storrow as irresponsive.*]

Cross-Q. 95. In the first paragraph of your 62d answer, you referred to a statement which you said will be found on page 19 of Mr. Bell's affidavit, and also, you believe, in his testimony. In the same paragraph you said: "Looked at in this way, it will be seen that Mr. Bell's statement, made long after he had obtained his patent of March, 1876, might easily be twisted into a bearing on this case, which would lead the Court astray, even if that object were wholly unintentional." I suppose when you so testified you did not remember that one of the passages in his testimony, which you have since referred to in this connection, and the only part of his deposition which you have specifically quoted in this connection, is found in his letter of May, 1875, which letter constitutes the whole of his 63d answer, did you?

Ans. That question involves a singular distortion of facts, owing to some lapse of memory, I fear, now on the part of counsel. It is not true, that the only part of Mr. Bell's statements that I have specifically quoted is taken from his letter of May 4th, 1875. On the contrary, in my answer to cross-question 89, will be found quoted in full, a sentence taken from the body of Mr. Bell's affidavit, embodying the specific statement of what I take to be his opinion, in the words, "for, 'quality' or *timbre* or articulation were ultimately resolvable into these two characteristics of vibration." That affidavit appears to have been sworn to by Mr. Bell on the sixth of September, 1880.

Cross-Q. 96. Did you not observe, when the preceding question was read, that it carefully stated that the passage from the letter was the only passage specifically quoted in this connection from Mr. Bell's deposition?

Ans. Certainly I did, and the other passage, to which I referred in my answer, was also quoted from a deposition of Mr. Bell, made in this case. In fact, the last deposition appears to have been made in this particular case, while the other one appears to have been taken in some other case and stipulated into this one. In my previous answers I refer to both of the depositions indifferently, assuming that both set forth Mr. Bell's sworn statements. If counsel desires me to restrict myself to the consideration of either one of them, it would avoid ambiguity if he would state the fact definitely in his question.

Cross-Q. 97. Have not both you, and counsel in this case, in taking your deposition, distinguished between the preliminary affidavits, and the testimony specially introduced for final hearing; by styling one "affidavit" and the other "deposition" or "testimony;" and did you not apply this very distinction to Mr. Bell, in the first paragraph of your 62nd answer, which was referred to in my question?

Ans. It is very likely we did, and that is just what I am trying to get counsel to do. The affidavits are, I think, rather more full than the depositions in the *prima facie* case—contain statements at length that the depositions do not so contain. I have endeavored usually to distinguish between them, by speaking of the affidavits as forming part of Complainants' moving papers for a preliminary injunction, and of the testimony as taken in Complainants' *prima facie* case. Counsel in his question merely spoke of "depositions," which I understood to mean all the testimony of Professor Bell, whether contained in one place or another.

Cross-Q. 98. Has the word "deposition" been applied to describe the affidavits, either by yourself or by counsel, in any answer or question in your deposition?

Ans. I am sure I don't remember. I may have used it, and I may not; if I did, the use was inadvertent on my part, for I generally meant to describe the affidavit in the terms already stated. I don't see what this has got to do with the understanding which I formed of counsel's question, which I have now fully explained, and which, if he thinks it was erroneous, he could easily correct by a word or two.

Cross-Q. 99. When you gave that part of your testimony, which is set down in the first paragraph of your 62nd answer, did you in fact have in your mind the letter of May 4th, 1875, which constitutes Mr. Bell's 63rd answer?

Ans. I cannot say that I did. I simply meant to say that Mr. Bell had made such and such a statement in his testimony. Of course I had seen the statement in the letter, but in my answer, as stated, I had reference merely to the fact itself, and not to the form in which it appeared.

Adjourned until March 21st, 1882, at half-past ten o'clock, A. M.

March 21st, 1882, 10.30 o'clock, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Cross-examination of Mr. Park Benjamin by Mr. Storrow continued:

Cross-Q. 100. In your 90th and 92d answers you allude to two passages of Professor Cross' testimony, and say, in substance, as I understand you, that the word "direction" in one of the passages which you quote may be replaced by the word "quality"; "time or frequency" may be replaced by the word "pitch"; "amplitude or intensity" may be replaced by the word "loudness." Do you think that those three sets of words are so far correlative in acoustics that the one can be replaced by the other in such statements as those in Professor Cross' deposition, which you have quoted or referred to in those answers?

Ans. My basis for the substitution noted in the question is Professor Cross' own use of the words "direction," "amplitude" and "frequency." Thus he says on pages 28 and 29 of his affidavit in Complainants' motion papers for a preliminary injunction, "What is needed, therefore, is that the transmitting instrument, moved by the voice of the speaker, shall control, at every instant and without any interruption, the direction of change, the amplitude or violence of change and the frequency of change in the current, and thus make these conform to the varying changes of motion in the air particles due to the voice of the speaker. These three kinds of change—in direction, in amplitude, and in frequency—cover all the variations of motion and all the variations of current strength involved." Variations in direction, variations in amplitude, and variations in frequency, result in variations in quality, loudness and pitch.

Cross-Q. 101. Will you please to examine Professor Cross' 6th answer, and state what paragraphs or what sentences in that you think are correct, and what paragraphs or what sentences you think are wrong, indicating them in such a way as may be most brief and convenient.?

Ans. I do not now notice any error in the answer from the beginning down through that paragraph ending with the words "desired sound at will." I disagree with all the rest of the answer, so far as it relates to Bell's patent No. 174,465, March 7th, 1876. I agree with the last four paragraphs of the answer, beginning with the words "no form of transmitter."

Cross-Q. 102. I observe that you limit your disagreement with him as to part of his answer, by the phrase, "so far as it relates to Bell's patent of March 7th, 1876." I infer from that limitation that you agree with him that a true and operative speaking telephone apparatus would act as he states in the passages referred to, but that you think that the apparatus described in Mr. Bell's said patent is not an operative speaking telephone, and will not so act. Do you intend to make a distinction of such a character?

Ans. I think that idea is correct.

Cross-Q. 103. Not far from the middle of your 16th answer, and as part of the statement of your opinion about Mr. Bell's first patent, I find this clause: "If the instrument was not capable of transmitting articulate speech before the cone and membrane were added, it certainly could not do so by their aid;" do you think that a correct statement?

Ans. Yes, sir; I do.

Cross-Q. 104. In the last paragraph of your 12th answer you speak of using in the fall of 1877, two small hand Bell telephones, in the ordinary well-known form, which were sent to the office of the *Scientific American* for examination. Are those the instruments which are figured in the *Scientific American* article of October, 1877?

Ans. I cannot say; my impression is that I had the instruments later than that date.

[*Complainants' counsel puts in evidence the said article, to be marked "Complainants' Exhibit Scientific American, article of October 6th,* 1877."]

Cross-Q. 105. You have spoken of the various trials you have made with the exhibits which have been put in evidence as Drawbaugh's instruments or as reproductions of instruments made by him; on what days did those tests take place, and what instruments did you test upon each day?

Ans. On referring to memoranda made at the time, in order to refresh my memory, I find that the tests were made on the following dates, and as follows: November 29th, 1881, instruments "A" and "D"; November 30th, instruments "D" and "E," "H," "A," "C," "I" and "F"; December 1st, instruments "D" and "E," "G," "O," "L," "M," "P," and "B"; December 14th, instruments "B" and "F." Some of these instruments were reproductions, as I have already stated.

Cross-Q. 106. What low conductor did you use in "F reproduced"?

Ans. A black powder, evidently carbonaceous, supplied to me by Mr. Drawbaugh, who put it in the instrument in my presence, and who informed me that it was, I think, pulverized gas-carbon mixed with charcoal or plumbago.

Cross-Q. 107. How fine was it?

Ans. It seemed to be a very fine powder, perhaps as fine as flour.

Cross-Q. 108. How thick a layer of it was there in the cup of the instrument when you used it?

Ans. It very nearly filled the cup, the upper plate resting on the powder, the plate being a little below the rim of the cup. I saw Mr. Drawbaugh put the powder into the cup, which he lowered down for the purpose. He filled the cup nearly full and then levelled the powder carefully on top; then he raised the cup, so that the surface of the powder came in contact with the plate; and then the plate was, as I have stated, apparently a trifle below the edge of the cup. The thickness of powder then was about a quarter of an inch. In adjusting the instrument the cup is, of course, somewhat raised or lowered; so that it is scarcely possible to state the exact position of the plate with reference to it. I think, however, the foregoing is substantially correct.

Cross-Q. 109. Will you please state, if you can, the electrical resistance of the various pieces of apparatus which you tried on those days and have testified about?

Ans. I cannot for the following reasons: first, because I wasn't asked to measure it; second, because there was no apparatus there to do it with, if I had been asked; third, because I wouldn't have done it anyhow, because I was testing simply to find out whether speech could be transmitted through the apparatus, and not to determine its electrical resistance.

[*Complainants' counsel now requests Defendants' counsel to cause the tests of the instruments "F reproduced," "B reproduced," "C reproduced," "I reproduced" and "A" to be repeated in New York in the presence of such persons as the Complainants may ask to attend, and request him to name a day for that purpose as early as may be convenient.*

Defendants' counsel replies that said instruments are all here in charge of the examiner, and the Defendants' expert, Mr. Benjamin, is in the hands of Complainants' counsel under cross-examination, and Complainants' counsel are at liberty to arrange for any test they desire, at any place in New York City, or time, and in the presence of any people they may elect; provided only that the Defendants' counsel and expert have opportunity to attend, and that the Examiner attend and retain control of the instruments.

Complainants' counsel now makes of the witness the same request just *made of Defendants' counsel; and Complainants' counsel states that in all other respects the cross-examination is now closed.*

Witness states that he will be glad to oblige Complainants' counsel in any way, but he will do whatever he is directed to do by Defendants' counsel.

Defendants' counsel directs the witness to do as Complainants' counsel requests, and states that Defendants will pay him all charges and expenditures in that behalf.

Counsel agree that the tests be made here in Mr. Benjamin's office, on Thursday, March 23rd, 1882, at eleven o'clock A. M., to which time and place the session is adjourned.]

THURSDAY, *March 23rd*, 1882.

By consent continued until Tuesday, March 28th, 1882, at eleven o'clock A. M.

March 28th, 1882, 11 *o'clock* A. M.

Examination resumed pursuant to adjournment, the place of meeting having been changed to No. 4 East 14th street, New York City, at the office of The People's Telephone Company, and private office of Mr. Marx.

Present Mr. Smith and Mr. Storrow for Complainants, and with them Messrs. Charles R. Cross, F. L. Pope, W. W. Jacques, Frank W. Smith, Arthur W. Wright; Mr. Hill for respondents, and with him Messrs. Park Benjamin, Daniel Drawbaugh, Marcus Marx, Ernest Marx, B. C. Paddock and S. Chamberline.

The morning was occupied in tests of various Drawbaugh telephone instruments.

Recess for lunch from 2 to 3 o'clock P. M.

The tests were continued in the afternoon, the same persons being present, and also Mr. August H. Girard, invited by Respondents' counsel, and Mr. Ernest H. Rydall, stenographer for Complainants' counsel.

The tests occupied the entire afternoon.

Adjourned at 7 P. M., until March 29th, 1882, at 11 o'clock, A. M.

March 29, 1882, 11 o'clock, A. M.

Examination resumed pursuant to adjournment.

Present Mr. Storrow for Complainants, and Mr. Hill for Respondents; also Messrs. W. W. Jacques, Frank Smith, F. L. Pope and Ernest Rydall, stenographer, on behalf of Complainants, and Messrs. Park Benjamin, Daniel Drawbaugh, Marcus Marx, Ernest Marx, George H. Benjamin, F. A. Klemm, S. Chamberline and Patrick Donahoe, stenographer, on behalf of Respondents.

The morning was consumed in tests of instruments.

Recess for lunch from 1.30 to 2.30 o'clock, P. M.

The tests were continued in the afternoon in the presence of the above named persons.

The tests occupied the whole afternoon.

Adjourned at half-past six o'clock, P. M., until March 30th, 1882, at 11 o'clock, A. M.

March 30*th*, 1882, 11.15 A. M.

Examination resumed pursuant to adjournment.

Present Mr. Smith and Mr. Storrow for Complainants, and Mr. Hill for Respondents; also, Messrs. Jacques, Pope, F. Smith, and Rydall, on behalf of Complainants, and Messrs. Girard, Paddock, Benjamin, Drawbaugh, Marcus Marx, Ernest Marx, and Patrick Donahoe, on behalf of Respondents.

Morning occupied in tests.

Recess for lunch from 2 to 3.30 P. M.

Examination resumed after lunch.

Present Mr. Storrow for Complainants, and Mr. Hill for Respondents.

Cross-examination of Mr. Park Benjamin by Mr. Storrow continued.

Cross-Q. 110. The record shows that since the last question I asked you, on the 21st of March, various tests have been made at the office of The People's Telephone Company, and the private office of Mr. Marcus Marx, in the building No. 4 East 14th street, New York City; will you please describe the arrangement of the rooms and places, and the lines of wires used in these tests?

Ans. The rooms between which the line was run are located respectively in the front and back of the building No. 4 East 14th street, a long hall or passage way extending between them. The depth of the building, between front and rear walls, is, I am informed, eighty-four feet. The front room was used chiefly as a receiving room, and the rear one as a transmitting room. A double line of wire, forming a metallic circuit, was led between these rooms, terminating at one end at the rear wall of the rear room, and passing into a closet in the front room. Upon this line most of the tests were made. Its total length, I think, was something over one hundred feet. A second line of wire was also led between the two rooms, and connected with the gas fixtures in each, so as to complete a metallic circuit through the wire, and gas pipes of the house. This line was used for general communication between the two rooms, such as reporting results, &c., and served as a means of verifying, in some cases, the messages transmitted by the other line. To this second line, which I shall call for convenience the "tell-tale line," were attached two Bell magneto-telephones of the ordinary "butter-stamp" form, these instruments being provided by Complainants. When the doors of the rooms were closed it was not possible to hear speech between them passing through the air; and when the person receiving the sentences, words, &c., shut himself up in the closet in the front room, the noise of the street was, in a large measure, cut off. Care was taken to check, as much as possible, noises occurring in the rooms, due to the speaking or moving about of persons in them, and although it was scarcely possible to obtain such a degree of quiet as was had during previous tests to which I have referred, the conditions in this regard were perhaps as favorable as could be had in a building located on a city business street.

Cross-Q. 111. Please state who did the listening, or most of the listening, at the receiving end, during the tests on these three days?

Ans. I did most of the listening. Professor Cross and Mr. Wright, on the first day, and Messrs. Pope and Jacques on the first two days, also listened frequently.

Cross-Q. 112. Please state what the arrangements and general course of proceeding were, in the receiving room, for listening or recording what was heard, so as to compare it with what was spoken in the transmitting room, and for informing the transmitting operator whether he was understood, and requesting him to repeat whenever the listener desired?

Ans. Speech was uttered into the instrument in the transmitting room and was received by me in the closet of the receiving room. If I distinguished the words or sentence, I immediately repeated the same aloud. If I did not distinguish it, I either said "no," or "repeat," or "once more," or "again," or something to that effect. During the first day the message, as I announced it verbally, was taken down in writing, chiefly by experts present for Complainants; and after they had done this, the same message was sent over the "tell-tale" line and received by Complainants' counsel, who compared what he heard with what had been written down. This plan was followed chiefly when series of numbers were transmitted. The newspaper paragraphs on the first day were not transmitted over the "tell-tale" line in their entirety, for purposes of comparison; and I believe that only the first two words of each paragraph were sent, so that the paragraph could subsequently be identified and comparison made at a future time. On the second and third days articles from newspapers, sentences, &c., were transmitted in short clauses which I repeated verbally, if I understood them, or else indicated that I did not, in the manner already stated. Then each clause, as I announced it, was sent back to the transmitting room through the "tell-tale" line, and the person receiving it there in turn repeated it aloud, so that the original sender could thus compare the message as I received it with the same as he had uttered it. If he found that I had misunderstood a word, or had failed to catch any part of the clause, he generally repeated it over again; and in this way it was possible to determine the accuracy of transmission as we progressed; and by the aid of the "tell-tale" line I was also enabled to suggest changes in the adjustment of the transmitting instrument.

During all these tests, I believe that there was a stenographer or other person present on behalf of the Complainants, taking notes of what was said and repeated back through the "tell-tale" line in the transmitting room; and on the second and third days a stenographer or other person on the part of the Defendants performed like service in the receiving room.

Cross-Q. 113. Will you please enumerate the different instruments which were used on the testing line during these three days?

Ans. Drawbaugh's original instruments "A," "E," "O," and "H"; the "reproduced" instruments "F," "B," "C," and "I"; Bell and Tisdel magneto-telephones.

Cross-Q. 114. When "H" and "O" were first produced in this cause, and marked for identification and drawn by Mr. Knight, the carbons, which were necessary to make the contacts and to transmit speech, were not in them; and their absence was indicated in Mr. Knight's drawings

AMERICAN BELL TELEP

by dotted lines; when the instruments were formally offered in evidence, some time after December 14th, such carbons were in them. I understand that those carbons were placed in them by Mr. Drawbaugh, about the time you performed your experiments with them, in November or December last, as you have testified, and for the purpose of enabling you to use them; is that a fact? I believe you have so substantially stated in your deposition.

Ans. I understand from hearsay that it is a fact.

Cross-Q. 115. At the close of your last examination, on the 21st of March, you called attention to the fact that the armature of "B reproduced" had become detached, by accident, and stated, that you thought some other displacement or disarrangement of the parts might have taken place since you used them at Eberly's Mills, in November or December, and it was then agreed that you might cause any such accidents or deterioration since your tests to be repaired for the purposes of the tests for the last few days. Will you please state what, if anything, has been done in those respects, and by whom, and when?

Ans. Shortly after the close of my last examination, while conversing upon the subject of these instruments, Mr. Ott, the Examiner in this case, reminded me of the fact, that many of them had been taken apart by Complainants' counsel during the progress of the examinations of Messrs. Knight and Drawbaugh, and that in some cases Complainants' counsel had put the instruments together again, and in other cases had left the parts of the instruments strewn upon the table, when the Examiner himself put such instruments together the best way he could; and as I remembered, myself, having seen many of the instruments apart in the hands of Complainants' counsel, I considered it almost a certainty that the instruments were not in working adjustment, as they were when I tested them before. The request made to me by Complainants' counsel was for a repetition of the tests previously made, and this, I considered, fairly involved a reproduction, so far as possible, of the conditions of the previous tests. One of these conditions was the putting in order of the instruments by Mr. Drawbaugh, and I accordingly asked Defendants' counsel to cause Mr. Drawbaugh to come here to New York, and make such repairs or adjustments as might be found necessary, in order to bring the instruments back to the state in which they were during my experiments of last winter and to neutralize, so far as possible, such deterioration as they might naturally undergo during nearly four months continual handling and two railroad journeys. Owing to Mr. Drawbaugh's familiarity with these instruments, I knew besides, that time could be saved by having him attend to them. Mr. Drawbaugh accordingly came on here, and, in the presence of the Examiner, I think, and mostly in my presence, made the following repairs:

In instrument "A," the thin wooden diaphragm was found to be warped, so that the armature attached thereto was not properly presented to the poles of the magnet. This diaphragm we slightly steamed, straightened in a copying-press, and replaced it in the instrument. During handling, a piece of the diaphragm was accidentally broken off. We glued this on again with a strip of paper pasted over the joint to hold it firmly. That is all that was done to that instrument.

In instrument "B," we simply re-secured the armature to the diaphragm with a little glue.

In instrument "C," we placed a piece of wood across and over the permanent magnet, and put a screw down through this piece and into the wooden base. The object of this was simply to hold the magnet in place, and to prevent accidentally moving the magnet during the experiments.

To instrument "E" nothing was done, beyond connecting with solder one of the conducting wires leading from the instrument, which wire broke in my hands this morning, while I was testing it.

To instrument "F" nothing has been done beyond re-filling the cup with the carbon powder, which, Mr. Drawbaugh informed me, is of the same composition as that used in the instrument during my previous experiments, and contains gas-carbon and plumbago.

We undertook to repair instrument "D" for use in this test, but on examining it discovered, that the conducting wire leading from the inner end of the coil had become broken off close up to the metal disc on the end of the core. It was impossible to attach a new conducting wire to this by twisting it on, and so we tried to solder on a piece of wire and establish the connection in that way. On trying the instrument, however, after the junction was apparently effected, we found that either the joint was very imperfect, or else that there was some short-circuiting in the coil itself, as the magnetism produced in the case by a battery-current was only barely perceptible. On testing the instrument myself, I obtained sounds through it very feebly. As the instrument had already been put in evidence, I did not feel justified in unwinding the coil to find out the trouble. In my previous experi-

AMERICAN BELL TELEP

ment with this instrument, I took it apart and rewound the coil with the original wire that was on it, after repairing a break upon it, which then occurred. I then found the instrument "D," as I have already testified, to receive and transmit speech well, and in all particulars to be as good an instrument as instrument "E," the construction of which is almost exactly similar. As I did not feel justified in unwinding the coil without the express consent of Complainants' counsel, and as to subject the instrument to trial in its present condition could not result in a fair showing of its capabilities when in good order, it was not used during the tests lately made.

In instrument "I" no change of any kind has been made beyond the insertion of one or two paper gaskets under the diaphragm, in order to modify the distance between the armature and the poles of the magnet. In instrument "O" nothing has been done beyond sand-papering the carbons to expose fresh surface. In instrument "H" a new intermediate carbon was put in between the two fixed carbons, the intermediate carbon or carbons used in the previous tests having been lost. This single carbon took the place of the three carbon balls shown by dotted lines in Defendants' "H" drawing.

We also put a new pair of brass hinges on the door of "H" instrument, leaving the old white hinges on, these last having become broken; and we also re-soldered some of the connecting wires at the old places from which they had become separated. I think I have now named everything that we did to the instruments, other than the adjustments made by the means provided in them for the purpose, these adjustments being made not only before, but frequently during the progress of the tests.

[*At the request of the Defendants' counsel the examiner certifies that all the above mentioned work in the way of repairs and adjustments, for the recent tests, was done in the presence of the examiner.*]

Adjourned until March 31st, 1882, at ten, A. M.

March 31*st*, 1882, 10, A. M.

Examination resumed pursuant to adjournment.

Present same counsel.

Cross-examination of Mr. Park Benjamin by Mr. Storrow continued:

Cross-Q. 116. Will you state, if you can now, how the carbon powder for the cup of "F" was prepared, and what proportion of plumbago was in it, if you have ascertained from Mr. Drawbaugh?

Ans. Mr. Drawbaugh has informed me that the powder used in instrument "F" is composed of carbon from gas-retorts, and plumbago, in the approximate proportion of five parts of carbon and one part of plumbago, the carbon being first ground and the plumbago being obtained in a pulverized state. The materials were mixed in a mortar. The proportions before stated were by bulk and not by weight.

Cross-Q. 117. I understand that when the instrument "H" was first produced and identified and marked by the examiner, the wires inside were so broken as to destroy the electrical connections and render the instrument incapable of use. It is evident from your deposition that the electrical connections had been repaired and restored by putting in new wires or resoldering the old ones, as well as putting in the intermediate carbon, between the time when Mr. Knight made his drawing and the time when you made your test, in December last. Please compare Mr. Knight's drawing with the instrument now present, and state what appears to be the fact in that respect?

Ans. The Defendants' "Exhibit H drawing, sheet 2," shows as follows: The primary wire leading from the diaphragm to the induction-coil is indicated as broken. In the instrument the separated ends have been twisted together, completing the connection, and a little solder applied to the twist. The other primary wire leading from the induction-coil is shown in the drawing passing through a plug marked L^2. The end of this wire appears to have been removed from this plug and soldered to a brass plate, marked K, attached to the inside of the box, leading the circuit through a wire marked L' in the drawing, sheet 2, which wire is led up through an aperture on the right hand side of the top of the box, not lettered in the drawing; and at this point another length of wire is connected to it in the instrument, to establish communication with the battery. The primary wire connected to the upper end of the plate D', in sheet 2, is shown as detached in the drawing from the plug or binding-post to which it should be attached on the side of the instrument. This connection has been re-established, and another piece of wire has been added on outside of the box for purposes of convenience in making connections with the battery. The two secondary wires leading from the induction-coil are shown properly secured to their binding-posts K^3. They are still so secured in the instrument. The short wire leading from the lower binding-post K^3 to the upper end of the switch K′ is now in place in the instrument, as shown in the drawing. In both series of tests this switch was left open. The bell connections and mechanism, shown imperfect in the drawing, have not been restored, nor has this part of the apparatus been used during the tests. Two wooden plugs have been inserted in the apertures through which the primary wires leave the instrument, in order to hold said wires in place. These connections are substantially, I think, the same as the drawing indicates to have existed in the original instrument. The change in the attachment of the primary wire from the plug L^2 to the plate K was rendered necessary by the loss of an outside swinging switch-lever not shown on the drawing, but which switch-lever extended from the pivot, marked L in "Exhibit H drawing, sheet 3," to the point L^2, where the wire was connected, and the wire leading out of the instrument was connected to this switch-pivot. What has been done is to make a direct wire connection through the plate K, instead of through the switch-lever, so that no material change has been effected in the arrangement of the circuit. The switch lever is not shown on any of the views of the instrument given in the drawings, and hence appears to have been absent when the latter were made.

Cross-Q. 118. Please state whether the instrument "H" was held in the hands of the operator or how it was supported, during the recent tests?

Ans. During the first day of the tests, this instrument stood on a long table in the rear room. It was not in any wise attached to the table. There were constantly a number of people in the room, and many of them were gathered about the table, often leaning upon it for purposes of writing, &c. I have found by actual experiment, that the instrument "H" is an exceedingly sensitive transmitter, and I noticed at once, when it was used in connection with the receiving instrument "A," during the tests made on the first day, that the sounds transmitted by it were being greatly interfered with and modified by accidental bodily movements of people about the table—by the vibration of the instrument as a whole upon the table, whether caused by the shaking of the latter, or by a possible slight movement of the instrument itself by the person speaking into it—perhaps through the influence of his voice itself. At all events, I noticed that the sounds and speech obtained through this instrument and "A," under these conditions, was much less clear and distinct than I had obtained with the same instruments during previous tests, when means were taken to give the instrument "H" a better support, or when it was not so liable to accidental disturbance. The tests of instruments "H" and "A" occurred at the end of the first day, March 28th, and immediately thereafter I caused the instrument "H" to be firmly secured to the walls of the room, by screws passing through the two holes, shown in the drawings, in the back-board of the case. I left the instrument "A" exactly as it was—made no change whatever in it—and on the following morning repeated the tests of the two instruments "H" and "A." The result proved, I think, that the difficulty was due to the cause I have indicated; for on this second trial, speech uttered into "H" was received by me through "A" clearly and distinctly, and with exceedingly little loss of words or misunderstanding, even under the rigorous conditions of test which I have already described. During the remainder of the tests the instrument was left attached to the wall, and no change was made in it, other than such as occurred during the ordinary adjustments of the carbons, as the same were judged necessary.

Cross-Q. 119. Will you please describe how the tumbler instrument, marked "F reproduced," was held or supported during the tests of this week?

Ans. Most of the time, I think, it rested on the table referred to in my last answer, and during the last day a large block of artificial stone was placed beneath it, so as to afford a little firmer support. The stone rested on the table.

Cross-Q. 120. Will you please to look at the original instrument "F," which is stated to have had at one time a membrane diaphragm, and state whether you perceive any way of attaching or securing the diaphragm, except tying or securing it to the top of the tumbler; and then state whether you think it possible to attach a diaphragm to a smooth glass tumbler, so as to stretch it and keep it stretched; and if so, how it could be done in that instrument?

Ans. I think I will undertake to put a membrane diaphragm on the instrument, if the counsel desires it, stretch it and keep it stretched; and I think I will do it in two ways, as follows: First, begin by wetting the membrane; that makes it soft and pliable and expands it some; take the plate and supporting wire out of the mouth-piece; lay the membrane across the bottom opening of the mouth-piece; bring its edges up around the sides of the mouth-piece and pass waxed silk or strong thread around membrane and mouth-piece, and above the bead or ridge which encircles the lower edge of the latter; leave the membrane rather loose. Now hold the mouth-piece up to the light, so as to show the hole, through which the plate rod passes, and make an aperture in the membrane for said rod, which can now be replaced; now put the mouth-piece on the tumbler, pressing it well down; the membrane being somewhat loose, and also yielding, will give considerably, and sufficiently to enable the mouth-piece to be pressed down in place; now set the apparatus aside, until the membrane is dry and consequently contracted, and I think it will be found firmly and tightly stretched across the top of the tumbler.

Second method, somewhat simpler; I have here a silk handkerchief; I place it over the top of the tumbler; I place the mouth-piece down on it, pushing the mouth-piece down slightly; there is the diaphragm secured in place by the mouth-piece and, I think quite tightly; and if this handkerchief was a wet membrane, on its becoming dry in its present position, it would be found stretched tightly and permanently. It will be noticed that this tumbler has quite a flare to it, so that there would be no difficulty in securing the diaphragm by a string, if any one chose to do it in that way; though that doesn't seem to be necessary, in view of the tight fitting of the mouth-piece. This method of fastening a membrane over the end of a smooth cylinder by a ring or band pressing down upon it is very old, and Mr. Drawbaugh need have looked only at the first drum he came across, to have got the idea.

Cross-Q. 121. In using the instrument marked "B reproduced," (tin can receiver), during the present week, have you found the operation of the instrument interfered with or stopped by the tin can slipping towards the magnet, so that the armature and magnet came in contact?

Ans. To a certain extent, yes; but that is due to the way I held the instrument, for purposes of convenience, in listening at it. It will be seen by the drawings, that this instrument was originally made to be placed upon a table, or other support, so that the person using it could bring his ear to the instrument, instead of holding the instrument to his ear, as I did. It will be noticed also, that the drawings show, that the distance from the mouth of the can to the edge of the base is the same in both instruments; while in the original instrument "B," the distance is greater than in "reproduced instrument B." I think the board has been cut off, in the latter case, merely to allow the instrument to be more conveniently handled, and to enable the user more easily to place his ear against the mouth of the tube, when the appar-

LEPHONE COMPANY,-2

atus is held in the hand. The can is not very tightly secured by its strap, in the reproduced instrument, and hence it slipped a little at times, with the result of occasionally interfering with the operation of the instrument; though this slipping, as I have said, was due to my handling, and could not have occurred if the instrument had been fastened to the table. During my tests at Eberly's Mills, I had the instrument "B" on a support, at a convenient height for my ear; and did not hold it in my hand, and consequently was not then troubled with the slipping of the can.

Cross-Q. 122. It appears to me that the instrument marked "B reproduced," and used in these tests, is not the same instrument, shown in Mr. Knight's drawing, marked "reproduced B drawing." Please compare the instrument and the drawing, and state what the fact is about that. I also call your attention to a statement of Mr. Hill, the Defendants' counsel, on page 1040 [1005] of Defendants' printed record.

Ans. The instrument "B reproduced," which I used, is essentially the same as that shown in Defendants' exhibit "reproduced B drawing," but differs in immaterial matters of detail, which differences will be apparent on inspection. From the statement of Defendants' counsel, which I have just heard read, I understand that the drawing while representing exactly one of the two reproduced instruments "B," mentioned by Mr. Drawbaugh, in his answer to X Q. 1328, does not precisely show the instrument "reproduced" "B" in evidence. A pair of couplers, which I put on during the tests for purposes of convenience, still remain upon the instrument.

Cross-Q. 123. What batteries were used, during the tests of the week?

Ans. Two Leclanche′ prism cells; sometimes only one was used; sometimes two; never more than two. I noticed no difference in results, whether one or two cells were used.

Recess for lunch from 1 to 2 o'clock, P. M.

Re-direct examination of Mr. Park Benjamin by Mr. Hill.

Q. Q. 124. In these recent tests, March 28th, 29th and 30th, under the conditions which you have described, you tested the several instruments named, by the transmission of articulate speech through them and the line; did you?

Ans. I did.

AMERICAN BELL TELEP

Q. Q. 125. On March 29th did you test the instrument "H," as a transmitter, with the instrument "E" as a receiver, the former being located, during the test in the back room, and the latter in the front room, or the closet opening therefrom?

Ans. I did.

Q. Q. 126. What instruments were used on the "tell-tale" line during that test, to report back into the back room, what you heard through "E," in the front room?

Ans. Two Bell magneto-telephones, of the "butter-stamp" form.

Q. Q. 127. Who were with you, in the front room, during that test?

Ans. Mr. Storrow, Mr. Jacques, Mr. Paddock and Mr. Donahoe, a stenographer, and Mr. Marcus Marx, were in the room most of the time, and others came in at intervals.

Q. Q. 128. Who operated the "tell-tale" telephone, in that room, during that time?

Ans. Mr. Storrow, chiefly; in fact nearly all the time, during the tests of the instrument mentioned.

Q. Q. 129. Referring to that test of those two instruments, "H" transmitter and "E" receiver, please give such a history of it as will enable the Court to understand it, and its results fully and exactly?

Ans. To do this I shall read from notes, taken in the transmitting room, of what was transmitted to me, and verified by repetition back through the "tell-tale" line. The speech transmitted was uttered by Judge Hill, Defendants' counsel, and received by me, and was transmitted back over the "tell-tale" line by Mr. Storrow, Complainants' counsel, and received by Mr. F. W. Smith, present on behalf of Complainants, and who repeated aloud what he heard. It will be noticed occasionally, where Judge Hill's utterences involved an inquiry, I repeated them, and added an answer.

The letter H shows what Judge Hill said; the words in *italics* were repeated once; words in SMALL CAPITALS were repeated twice. The asterisks (*) indicate the number of repetitions over the "tell-tale" line, through the Bell instruments.

H. "What time did you get to bed last night?"

(I repeated, and answered: "About half-past twelve.")

H. "Did you go by the elevated railroad?"

(I repeated, and answered; "No, I walked up.")

H. "It must have been a long walk."

(I repeated, and answered; "No, it is only a mile.")

H. "Do you want some elevated railway news? I will read a report about the little girl's case, who was killed the other day; do you want that?"

(I repeated, and answered; "Yes, give us all you can.)"

H. "To get information—"

(I said; "Anything cheerful," and repeated.)

H. "I did not say, 'anything cheerful;' I began with, 'to get information;' I will begin again."

(I repeated, and answered; "Yes," when Judge Hill proceeded to read continuously, as follows; uttering a clause of a few words, and waiting until the same was repeated back through the "tell-tale" line, to the transmitting room.)

H. "To get information from the elevated railway officials, respecting affairs which the public have a right to know about, is a very difficult undertaking. The officials are particularly out of humor at present, with newspaper reporters, who persist in their inquiries, regarding the fatal accidents, that are occurring at rapid and almost regular intervals. The sad fate of the little girl—"

(The proper name transmitted here, I failed to catch. It was repeated, and I repeated it over, as I understood it, five times, finally settling on "Marie Menzel." The following word, "who," was repeated once.)

H. "—— was killed at Sixth Avenue and Twenty-third street, on Saturday evening, provoking a keen search."

(I failed to understand the last four words, and they were repeated four times for me. I still failed to catch them, and the first word was spelled, letter by letter—four times. I still missed three of the letters, and couldn't make out the word.)

H. "I am tired of repeating that pro-vok-ing.—"

(I then understood the word "provoking," and repeated it.)

H. "Keen—k-e-e n."

(I understood and repeated that correctly.)

H. "Search,—Search—s-e-a-r-c-h—s-e-a-r-c-h."

(I understood and repeated correctly.)

H. "for particulars, on the part of the reporter, has had the effect of *sealing* the mouths of *nearly all* the employés of the road, and making it more difficult than usual to get information. To-day a reporter for the *Graphic* called on Col. Hain, the general manager of the line, to learn the name and address of the brakeman on whose car the accident occurred, and what steps, if any, the Company had taken to place the blame where it belonged. The following colloquy took place: 'Has any investigation been made in the matter of Marie *Menzel?*' 'No.' 'Why not?' 'Haven't had time.' 'Is any going to be made?' 'Yes.' 'When?' 'As soon as we get time.' 'Has any statement been RECEIVED from the brakeman, regarding the matter?' The following clause is in parenthesis: 'It is customary, when accidents happen on the road, for employés knowing the facts to report them in writing;'—End of parenthesis. 'No.' 'What is the brakeman's name?' 'Don't know.' 'How is that?' 'Haven't had time to find out.' 'What *is* his address? 'Don't know.' 'Doesn't the Company know the *names or addresses* of its employés?' 'Yes, the train-master does.' The latter official was found at the station over Battery Park. The following colloquy took place between him and the reporter: 'Will you be kind enough to give me the name and address of the brakeman on whose train Marie Menzel was killed on Saturday evening last?' '*Doctor Shine will give you all the information about that.*' 'COL. HAIN *said ten minutes ago*, that the names and addresses of all the employés were known to you.' At this juncture the TRAIN-master held a long whispered conference with some subordinate official in his office. 'Can you give me the man's name?' asked the reporter when the conference seemed to be over. 'What is the use of publishing so much about the thing?' answered the train-master, evidently much annoyed. 'To learn on whose shoulders should fall the responsibility of the little girl's death.' 'The conductor's name is Zabriskie,' said the trainmaster after a moment's reflection. 'What is the brakeman's name?' 'I don't know, because he didn't respond to the order asking for *names* and addresses.' 'What order was that?' 'An order issued recently to employés to send in their names and places of residence. 'Was the brakeman a green hand?' 'No.' 'How long *has* he been employed on the road?'* 'A long time.' 'Then his name is on the pay-roll. 'What is he called there?' 'Bishop.' The reporter drew a long breath, and then began *an* attack for the first name. His efforts were in vain. Dr. Shine was next sought. He is the surgeon of the Company, and is supposed to know the names of the employés. 'Doctor, where does brakeman Bishop live?' 'Really, I don't know.' 'What is his first name?' 'I have forgotten.' 'Is it Henry?' 'Yes, it's Henry.' '*Do you know any more about the man than that?*' '*Oh, we know the men by their numbers, you know.*' 'What is his number?' 'Let's see, looking up at the ceiling.' '*Well, really, I have forgotten.* By the way, said Dr.

Shine, 'Bishop will be here about half-past twelve o'clock sharp. Come in then and get his story. The Company doesn't want to conceal anything.' The reporter was on hand promptly at the time. 'Dr. Shine has gone out,' said the girl who answered the door bell; 'will you wait? He waited a long time. At twenty minutes to two the Doctor was still absent and Bishop had not come in. It *is* understood that the Company *is* having a *device* made similar to the iron gates in use on the North River ferry boats. These are to be so arranged *between* the car platforms that an accident by falling between the cars would be impossible. Two hundred of these gates are in course of construction. The company has six hundred cars in use every day. That is the end of the article. It's title is, 'A reporter's difficult task. An illustration of the reticence peculiar to elevated railroad officials.' Amen." (At the end of this reading I left the receiving station, and Mr. F. L. Pope took my place. I remained in the receiving room and heard him repea what he heard to Mr. Storrow, who transmitted it over the "tell-tale" line. I find the following record on the notes taken in both rooms:)

H. "Mr. Pope, is that you at the instrument? I am about five feet away from it now. Shall I go farther? 'About five feet' repeated again. "*I am now about* TEN *feet away*. About ten, ten, t-e-n. Did you hear? *Did* you hear me? (Didn't get that at all.) I will now retire from the instrument A FEW FEET. (Can't get that, six times repeated.) I am now about six feet away. I am now about ten feet away. About ten feet away. I am now about ten feet away. I will read to you from the *newspaper*. WAIT *till I find* a good article." (Not heard, repeats twice more.)

"I read from the *Daily Graphic* of March 27th, 1882, as follows:

Last Wednesday in San Francisco a Mrs. Andrews *was instantly killed while walking in a prominent street* in company with her husband, upon whose arm she was leaning at the time of the fatal accident. *A business sign*—b-u-s-i-n-e-s-s—twenty-five feet long and eight feet wide, *fell from a considerable* HEIGHT. I did not say anything about "wife." I said fell from a considerable height, striking the unfortunate lady, and crushing her to the ground. Mr. A. escaped *with a few severe bruises.* The accident was the outcome of a violation of the city ordinance, which *had* become a dead letter. Is not this a warning to New York City authorities?

That is the end of the article that was read.

Do you want me to read another?"

At this point Mr. Drawbaugh came to the transmitting instrument.

The letter D indicates what Mr. Drawbaugh said into "H" as a transmitter, the italics and asterisks denoting as before the number of repetitions through the Drawbaugh and "tell-tale" lines respectively.

D. "MASSACHUSETTS FACTORY OPERATIVES. *This year's report.* (Factory, was uttered four times.) (I answered, "You are too near the instrument. Something about Court—'something before report.'" "Don't know what is before report.")

D. "*This year's—t-h-i-s*—year's report of the Massachusetts bureau of statistics of labor IS DEVOTED (four times) *more largely than usual* to subjects of purely local CONCERN. Some of the FIGURES—*f-i-g-u-r-e-s*—are, however, of general interest. The first subject discussed is the CONSTANTLY INCREASING CANADIAN FRENCH ('French' uttered three times) population OF *New England.* In the last report of the Bureau SOME VERY SWEEPING (uttered five times) and, as it now appears, very unjust remarks were made about these people."

D. "See if you can get the words you lost." (I replied, "No.")

D. "I'll give it. In the last report of the bureau *some very* SWEEPING (five times)—*s-w-e-e-p i n-g.* THEY (five times) WERE DENOUNCED (three times)—*t-h-e-y*—as *dirty*, ignorant and immoral, and in *order* to TAKE all this back—*t-a-k-e*—nearly one hundred pages are required. THEY MAY WELL FEEL PROUD—"

(I understood this to be, "feeling very well," and so answered.)

D. "That is not right. (I asked 'what is in front of very well?') '*They may well* FEEL PROUD.' Do you get that?—feel proud—*f-e-e-l*—not 'feeling' but 'FEEL PROUD., 'Feel proud' is the word—OF THE SHOWING—not 'as the showing,' but 'of the showing.' Not 'as' but 'of'—o-f—*they* MAKE HERE."

(Judge Hill here spoke into instrument "H," I remaining at instrument "E.")

H. "Mr. Benjamin, are you at the instrument now?"

(I repeated; and answered, "Yes.")

H. "Do you hear me clearly? The trouble is with Drawbaugh's voice; is it not? I thought that was the trouble. We will try to let him get through the article. I know it is very husky, and bad for the telephone, but we will try to let him get through the article, and after that I will read something to you."

(Mr. Drawbaugh now resumed his station at instrument "H," while I remained listening at instrument "E.")

ELEPHONE COMPANY,-2

D. "Mr. Benjamin, do you hear me now?"

(I repeated, and answered, "Yes.")

D. "Shall I go on with the article? Do you hear me distinctly?"

(I repeated, and answered, "Yes.")

D. "Shall I go on with the article?"

(I repeated, and answered, "Yes.")

D. "I will go on then. Now listen—they make here."

(I understood and repeated—"A late beer.)"

D. "No 'beer'—'here'—*h-e-r-e*—have you got the three words *they make here?* The three first words are 'they make here.'"

(I replied that I didn't know what they were.)

D. "'They make here.' I will go on with the rest, 'AND NATIVE (five times) NEW ENGLAND (three times) *must feel a sense of relief*—'"

(Mr. Drawbaugh here retired from instrument "H," and Judge Hill took his place, I still remaining at instrument "E.")

H. "Massachusetts factory operatives. Are you ready now, Mr. Benjamin? This year's report of the Massachusetts Bureau of Statistics of Labor is devoted more largely than usual to subjects of purely local concern. Some of the figures are, however, *of general interest.* The first subject discussed is the constantly increasing Canadian French population—not 'French,' but 'Canadian French'—In the last report of the Bureau some very sweeping, and, as now appears, very unjust remarks were made about these people. *They were denounced* as *dirty,* ignorant and immoral, and in order to take all this back; nearly one hundred pages are required. They may well feel proud of the showing they make here, and NATIVE *New England* must feel *a sense of relief at* learning that they are rapidly becoming assimilated to the rest of the population."

(Mr. Jacques now took my place at instrument "E," Judge Hill continuing at instrument "H." The notes show the following conversation between them:)

H. "*Mr. Jacques, are you at the instrument now?*" (Understood and repeated by Mr. Jacques.)

H. "DO YOU HEAR ME DISTINCTLY? (the whole sentence twice and 'distinctly' twice more.) *D-i-s-t-i-n-c-t-l-y. I will speak* A LITTLE LOWER. *See whether you hear me better* (not heard at all) *in a lower tone of voice.* Do you hear me better now? What do you think of QUEEN VICTORIA? I was too far from the instrument probably. Do you hear me better now? I will give you another sentence. How would you like to have the *bonds* that Jay Gould showed his friends the other day—*bonds*, not the 'bargain,' but bonds—b-o-n-d-s—it *is* bonds. YOU HAVE GOT IT RIGHT NOW. How would you like them?"

(This was finally understood and repeated by Mr. Jacques.)

(Mr. Drawbaugh now took his place in front of instrument "H," Mr. Jacques remaining at instrument "E.")

D. "Mr. Jacques, Drawbaugh is speaking now. Can you hear me *distinctly?* Mr. Jacques, it is getting time to take a lunch. Do you understand that? Do you feel so?"

(This was understood and repeated by Mr. Jacques, and there was a recess for lunch.)

It will be seen that I had some difficulty in understanding Mr. Drawbaugh when he read from a newspaper, although I had little trouble in recognizing what he said in conversational form. Mr. Drawbaugh's voice was more than usually husky, and certainly not in its normal condition. For, during my previous tests made at Eberly's Mills, I preferred that Mr. Drawbaugh should talk through the instruments, as I got his speech better and clearer than that of anybody else present at the time. Mr. Drawbaugh is naturally very diffident, and to read a newspaper article with long words in it before a room full of people, I think rather overtaxed him. The same article read afterwards by Judge Hill I understood very well.

Q. Q. 129. After completing the above described tests with the instruments "H" and "E," did you make a test with the instruments "H" and "A"; if so, please inform the Court of that test, as fully and accurately as you have just described the other test.

Ans. I did; and I now read from the same notes, as follows:

(In order to adjust the instruments, a series of numbers and a few words were said; and as soon as the adjustment was completed, Judge Hill proceeded as below.)

H. "I will read from the Congressional report of March 27th, in the *Graphic.* 'The bill reported from the Library Committee by Mr. Sherman, to continue the publication of the *American Archives*, was passed.

Mr. Morgan introduced a bill granting the right of way over public lands in Alabama to the St. Louis and Florida Railroad.

Mr. Allison offered a resolution—Mr. Allison, not 'Anderson'—instructing the committee on Revision of Laws to report what further legislation is necessary to define the meaning of the word "Indian Country" in the various statutes. Adopted.

Mr. Hoar introduced a bill to amend the statutes relating to copyright.

A motion by Mr. *Vest*, (repeated and spelled,) to recommit the bill admitting Dakota as a State, led to a short debate—debate not 'dispute'—on the financial record of the territory, but finally prevailed.

The bill granting the right of way for railroad purposes, through the lands of the United States Powder Depot, near Dover, New Jersey, passed.

The bill granting a pension of $50,000 per year to Mrs. Garfield, Mrs. Polk and Mrs. Tyler, from September 10th, 1881, passed. That is the end of the Senate proceedings of yesterday.' "

H. "Are you ready? I will now pass to the House proceedings.

'House of Representatives, Washington, March 27. The House adopted a resolution asking the State Department, to furnish a copy of any protocol or other papers, signed by Mr. Trescot, in solution to Chilian or Peruvian matters; also, to furnish any information in its possession *touching the prospects of the release of* American citizens, in British prisons.

Mr. *Flower* of New York—F-l-o-w-e-r—introduced a petition—'Yes,' I've been reading all the time. Are you ready to go on?—signed by 2000 New York merchants, for the passage of the Lowell Bankruptcy Bill.

The following were among the bills introduced.

To authorize the issue of $25,000,000 in fractional currency—not '$45,000,000,' but 25,000,000.

For the appointment of a commission to examine into the overflow of the Mississippi, *and report what is needed to prevent its reoccurence.*

To grant lands to Alabama, to the St. Louis, Montgomery and Florida Railroad.

To establish a Department of Industry.

To establish experimental farms in various sections of the country.

To pay the Government experts in the Guiteau case, $25 per day.

To survey the route of the Maryland and Delaware Canal.

To repeal the license tax of Commercial Agents in the District of Columbia.

Defining copyright, and to enact laws for the punishment of the violation of the rights.' That is the end of the House proceedings yesterday. Now I will try something else, if you want it.' "

H. "All right, I'm ready, are you?"

"A special Bankruptcy Commission of the New York Board of Trade and Transportation has published a broadside *comparing the Lowell bill and the Equity scheme'*—No, that's not right—'comparing the Lowell bill and the Equity scheme, now pending in Congress. To be sure, the Lowell bill makes a good show, and the Equity does not, but the latter is less important as the draft of a Bankruptcy act than as an obstacle raised for preventing the consideration of Judge Lowell's excellent bill.

The Equity scheme is dignified rather too much, when compared with the only well matured Bankruptcy proposition before the country. Why the latter is not taken up before Congress, *it* would be difficult to say, unless it be true, that Congress is partial to those measures which either are urged by the importunities of the country or like the *franking bill*—f-r-a-n-k-i-n-g—promote the personal interests of Congress, or like the apportionment act, help some political interest. If bills be judged upon their merits, the Equity scheme is not worth considering.

That is the end of the article about the Equity scheme."

Mr. Klemm now took Mr. Storrow's place at the "tell-tale" line, and Judge Hill continued reading into instrument "H."

H. "*A protest against the admission of* Dakota, was presented in the Senate yesterday, by Mr. Hale of Maine, who gave notice, that when the bill *for making* that territory a State was considered, he should propose an amendment, before the admission, until the record of the territory was clear. The allegation is, that the county of Yankton as principal, and the legislature of Dakota, as accessory, have violated the condition under which $200,000 was obtained under bonds, *to secure the construction of a railroad.* Mr. Hale said, his information was obtained from responsible citizens of Maine, who had been sufferers.

(Mr. Jacques now took my place, at instrument "E," and Mr. F. Smith spoke to him through instrument "H."

S. "Halloa, Mr. Jacques; are you ready? Do you understand what I say? Mr. Jacques, it is a lovely day. There is a great deal of news in the paper this morning, would you like some of it? I wonder if it is raining in Boston this afternoon?"

(Mr. Pope now took instrument "E," and Judge Hill spoke to him using instrument "H," as a transmitter.)

H. "Mr. Pope, do you hear me now?"

H. "Did you ever *eat* Boston baked beans and brown bread?"

H. "I will read from a newspaper article. Do you hear that? The new *wheat* regions. All estimates of the probable crop of wheat the country will produce this year, and the years immediately following, must take into account the remarkable development of the new grain fields of the far Northwest; Eastern Dakota and the adjoining portions of Manitoba are fast becoming an immense granary—'Halloa, shall I read to you from the newspaper. Well, what do say?'—Many thousands of new farms will be opened in that section this spring, and the settlers of last year almost without exception sow an *increased area of ground*. In fact, the *rule* among the *farmers*—the rule is to work as many acres as they can command the labor of men and animals to plough in season for seeding. The profits on wheat growing have proved to be so large and so trustworthy that the settlers are eager to make as large crops as possible. The experience of those who have been a few years in Dakota shows that an average net profit of $10 for every acre sown can be depended on with almost absolute certainty."

The speech received through instrument "A" was, I think, fully as good as that received through instrument "E." It is, of course, scarcely possible on these notes to indicate the cause of the repetition of words and clauses. In some cases I lost them through accidental noises occurring in the room, building or street. Sometimes there would be simultaneous talking at the receiving end of the "tell-tale" line, taking off my attention; and frequently I called for the repetition of a whole clause of several words because of my misunderstanding one in it. The percentage of words which I actually failed to understand until after numerous repetitions is exceedingly small, and most of these words were proper names. I was particularly careful to avoid guess-work, and often called for repetitions when I was reasonably certain of what the words were, by their general sound or context, because I had not heard them clearly enunciated; and I think I can say, that, taking everything into consideration, the speech which I heard, through the instruments "H" and "E," and "H" and "A," was fully as good, if not better, than any I have ever heard over the local telephone lines in this city.

Q. Q. 130. You have given an account of the demonstration of the capacity of instrument "E" as a receiver. In these recent tests, here in New York, has any demonstration been made of its capacity as a transmitting instrument; if so, please give the Court full and accurate knowledge of the facts?

Ans. On March 30th, the third day of the tests, instrument "F" was placed at the transmitting end, and instrument "A" at the receiving end. On the "tell-tale" line a Bell instrument was attached in the transmitting room and instrument "E" in the receiving room. Judge Hill spoke into instrument "F, reproduced." I received his words at instrument "A," and repeated them aloud to Mr. Marcus Marx; and he repeated them into instrument "E," and what he said was heard by Mr. F. W. Smith and Mr. Ott, and possibly some others at the Bell instrument on the other end of the "tell-tale" line. The testing of "F" and "A" required considerable conversation back and forth on the "tell-tale" line, owing to the extreme delicacy of "F" in the matter of adjustment, and this conversation was maintained intelligibly, as I know by the fact that I got intelligible answers through instrument "A" to questions which I heard Mr. Marx put through instrument "E," used as a transmitter. I also heard Mr. Marx converse for a considerable time with persons at the other end of the "tell-tale" line, through the two instruments mentioned. Subsequently I talked into the instrument "E" as a transmitter, with Mr. F. W. Smith, and also with Judge Hill, as follows: Some adjustment was first found necessary, as very loud talking by Mr. Smith at first resulted in faint tones received by me through "E" as a receiver. In the following conversation I used instrument "E" both as a transmitter and a receiver.

I talked into "E" as a transmitter, as follows: "I will read you something from a newspaper. Please repeat."

Mr. Smith answered, "Halloa. Once more. The door opened and spoiled it all. Now go on."

(The following is a note of what was uttered by Mr. Benjamin in the closet, and he understood that everything was received correctly by Mr. Smith, except when his, (Mr. Benjamin's) utterances indicated the contrary.)

"A test of the—Halloa, are you ready—A test of the underground—telegraph wires—laid in Market street—was made on Saturday—Saturday—in the presence of a number—of gentlemen from Boston, New York, Chicago and this city—one of the unfinished east rooms—one of the—one of the unfinished—unfinished—unfinished—east rooms of the new—public buildings—had been connected by five wires—with a store at Ninth and Market streets—and by a single wire—with the dynamo-electric machine—in the Grand depot—across the way—Three of the five running to Ninth street—were connected to telegraph instruments—these which were all solenoids—these which were all solenoids—solenoid—solenoid—s-o-l-e-n-o-i-d—Get that?—Halloa—Did you get that?—S-o-l-e-n-o-i-d—sol-en-oid—Yes, that is right—you have got it—Now I am going on—Halloa—you got that—are composed of one straight insulated wire—before one straight insulated wire, I said, are composed of—wrapped by another, their ends being joined—worked perfectly."

(The following is taken from Mr. Marx's notes on the same tests, taken in the back room where listening, Mr. F. W. Smith, was:)

"A test of underground telegraph wires laid in Market street was made on Saturday, in the presence of a number—a number of gentlemen from Boston, New York, Chicago—I do not get that—once more; I lost that—one of the—Don't get that—unfinished—the road of the new public buildings was then connected by five wires—being connected in a store at Ninth and Market streets; then by a single wire in the dynamo-electric machine in the Grand Depot across the way. Three of five running to Ninth street were connected with telegraph instruments (Mr. Smith says, 'Please repeat.')" These were all.

S. "It is loud but indistinct; you will have to spell it. It sounds like Alloid—No; please spell once more. A little slower and a little louder. I fail to get that."

B. "Solenoid."

A. "Yes, I'll listen; yes, that's all right."

B. "One great insulated wire—on the pole of one great insulated wire—ran by another, their ends being joined—worked perfectly."

(Judge Hill then took the Bell telephone at one end of the "tell-tale" line, and I talked into instrument "E" at the other end of that line. There was some little adjustment done, until he reported back to me that he heard me clearly; when I read to him the following article, clause by clause, which he repeated back to me in the same manner and as he heard it. The following is taken from the notes of Mr. Marx in the back room:)

"It was rumored at the hotels last evening that Mr. W. H. Vanderbilt had been taken ill very suddenly. A still later rumor had it—"

Judge Hill said, "repeat that louder." (I repeated last six words)—"that he had suffered a stroke of paralysis. An intimate friend of Mr. Vanderbilt, who was found at midnight, said that Mr. Vanderbilt went to his physician's office yesterday forenoon to consult him about a cold that he had taken, and that Mr. Vanderbilt—"

Judge Hill said, "The rest I lost because they were talking here." (I repeated part of the clause)—" when asked why he did not have his physician come to him, he answered, that he was quite well enough to go out—"

"I got that all right." (Said by Judge Hill.)

"This gentleman was to have called at Mr. Vanderbilt's house last evening, but was prevented by the rain. He said that if Mr. Vanderbilt had been stricken with serious illness he would have been likely to hear of it. He had heard of the alarming rumors, but he himself—"

Judge Hill said, "Did you say 'had no concern'?"

"Yes," I answered.

Judge Hill said, "That's what I thought you said at first"—'had no concern about them.'"

The only error in the reception of this was at the end of the last sentence, which involved a misunderstanding on the part of Judge Hill and myself. I said "He gave himself no concern," which was understood, "He himself had no concern," and so repeated back to me, when I understood it to be what I had originally said.

I read the foregoing article from the *New York Sun* of October 30th, 1881.

(The following is taken from notes made in the front room:)

"It was rumored about the hotels—last evening—last evening—Did you get that 'last evening'—Halloa—it was rumored about the hotels last evening that Mr. William H. Vanderbilt—had been taken ill very suddenly—still later rumor had it—that he had suffered—that he had suffered a stroke of paralysis.—An intimate friend of Mr. Vanderbilt—who was found at midnight—said that Mr. Vanderbilt—went to his physician's office yesterday—forenoon to consult him—about a cold he had taken—and that Mr. Vanderbilt, when asked—when asked why he did not have—why he did not have his physician come to him—answered that he was quite well enough to go out.—This gentleman was to have called—at Mr. Vanderbilt's home last evening—but was prevented by the rain.—He said that if Mr. Vanderbilt had been stricken with serious illness—he would have been likely to hear of it.—He had heard of the alarming rumors—but gave himself no concern about them.—That is all."

Adjourned until April 1st, 1882, at ten o'clock, A. M.

TELEPHONE COMPANY,-2

April 1st, 1882, *ten*, A. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Re-direct examination of Mr. Park Benjamin by Mr. Hill, continued.

The morning was occupied in verifying and copying notes.

Recess for lunch from 1 to 2 o'clock, P. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Re-direct examination of Mr. Park Benjamin by Mr. Hill, continued.

Q. Q. 131. You have given an account of the demonstration of the capacity of the Drawbaugh instruments "E" and "A" as receivers, and also of said instrument "E" as a transmitter; have you, since the cross-examination commenced, used the Drawbaugh instrument "A" as a transmitter? If so, under what circumstances, and with what results?

Ans. I have. On Monday afternoon, March 27th, 1882, the day before the recent tests began, I attached instrument "A" in the front room, and connected the line with a Tisdel magneto-telephone in the rear room of No. 4 East 14th street, New York, placing a battery in the circuit. Under this arrangement I found no difficulty in causing a person listening at the Tisdel instrument in the back room to hear what I uttered into the "A" instrument in the front room, through the line; and the conversation back and forth was for some time successfully maintained between us. I should have repeated this experiment during the recent tests, if I had not been fearful that the very thin wooden diaphragm "A" might become warped through the warmth and moisture of my breath. Mr. Drawbaugh regarded this as possible, and therefore I thought best not to use the instrument, as indicated. I will, however, if Complainants' counsel desires it, repeat this test at any future time.

The instrument "A," I understand, was constructed for use as a receiver, and, of course, when so employed, the diaphragm is not liable to become warped through the agency mentioned.

Q. Q. 132. From your various tests of the instrument "E" as a transmitter and as a receiver, and of the instrument "A" as a transmitter and as a receiver, and of the instrument "H" as a transmitter, state whether these instruments severally are, or are not, complete, practical electric speaking telephone instruments, for the transmission of spoken speech over electric circuits by means of electricity ?

Ans. I think that they are, unquestionably.

Q. Q. 133. Assume that Drawbaugh's instrument "A" was constructed in 1874, and take into consideration the comparison you have already made between this instrument and the apparatus shown in Bell's patent of March 7th, 1876, also your tests of said instrument "A," and state which of the two devices was the first practical working electric telephone for transmitting articulate speech ?

Ans. Drawbaugh's instrument "A." This instrument I have proved by a series of tests, now twice repeated under strict conditions, to be a good, practical, working electric speaking telephone. Even if Bell's device in his patent of March 7th, 1876, answered to this description, which it does not, as I have proved by making instruments in accordance with the patent, testing them and finding them utterly inoperative, still, under the assumption in the question, Drawbaugh's instrument "A" would be first in invention by more than one year.

Q. Q. 134. Assuming that Drawbaugh's instruments "D" and "E" were made in January and February, 1875, and having in view the same considerations to which I called your attention in the last question, please institute the same comparison, as to the device shown in Bell's patent of March 7th, 1876, on the one hand, and Drawbaugh's instruments "D" and "E," on the other hand.

Ans. I have proved Drawbaugh's instrument "E" to be a good, practical working electric speaking telephone, both as a transmitter and as a receiver, during both of the series of tests which I have made. I proved the same of Drawbaugh's instrument "D," which is constructed in almost a similar manner to Drawbaugh's "E," during my tests made at Eberly's Mills, and would have re-demonstrated the fact here in New York had not the instrument become accidentally injured in the interval, in the manner which I have already fully explained.

Even if the apparatus shown in Bell's patent of March 7th, 1876, is an operative one, which I have proved not to be the case, then, under the assumption in the question, Mr. Drawbaugh's instruments "D" and "E" were made about a year earlier, and at that time were capable of transmitting and receiving articulate speech through an electric circuit.

It would in my opinion be perfectly possible to place these two identical instruments ("D" being repaired) on any telephone line, and use them successfully as and for the purpose for which Bell hand telephones of the "butter-stamp" form are now commonly employed, under which conditions I think that very nearly, if not fully, as good results would be obtained as with said last mentioned Bell instrument.

Q. Q. 135. Bell's second patent, dated January 30th, 1877, lays particular stress on dispensing with a battery; please compare it, in that respect, with Drawbaugh's instruments "D" and "E"?

Ans. Drawbaugh's instruments "D" and "E" need no battery for their operation, both being magneto-telephones embodying a permanent magnet; so that in this respect they have the same advantage which Bell's device of 1877 has. No battery, it will be remembered, was used in my recent test, when I talked through Drawbaugh's instrument "E" and the "tell-tale" line to Mr. F. W. Smith and Judge Hill, in turn, who listened at a Bell "butter-stamp" instrument, and talked back to me over the same line.

Q. Q. 136. You mentioned the fact that Mr. F. L. Pope listened in the front room at instrument "A" or "E," or both; after listening did he make any remarks indicating his satisfaction, or want of satisfaction?

Ans. I was present in the room when Mr. Pope listened at the two instruments named, and I instructed the stenographer present, on behalf of the Defendants, to be particularly careful in noting down exactly what Mr. Pope said, if he should say anything at all, with regard to them. On the stenographer's notes I find the following, which accords with my recollection of what Mr. Pope said.

After hearing Judge Hill read to him the article already quoted in one of my previous answers, beginning "Last Wednesday in San Francisco, a Mrs. Andrews," which Mr. Pope heard through instrument "E," the words being spoken into instrument "H" at the other end of the line, Mr. Pope said: "I had no trouble at all in hearing anything spoken through Drawbaugh's instrument, and it compares favorably with any telephone that I ever heard. Words that were indistinct was the fault of the transmitter, and not of the receiver."

Mr. Pope also listened at instrument "A" to speech transmitted through instrument "H" and the line. During the course of the article on the new wheat regions, quoted in one of my previous answers, Mr. Pope said: "That is good enough. Let the other man try it now." I asked him, "Don't you think it (meaning instrument "A") is as good as "E"?" Mr. Pope answered, "That is first-rate." Mr. Pope then continued listening, and after another quite long section of the same article had been read to him—said section being quoted in one of my previous answers—said: "That is enough." I asked him, "How is that for a receiver?" (meaning instrument "A.") He answered, "That is very good indeed."

Q. Q. 137. State whether, during your recent tests here, you made any test of Drawbaugh's instrument "F reproduced" as a transmitter and if so, what instrument or instruments were used as receivers in connection with it?

Ans. I did. Instruments "E," "A," and "reproduced" "B," also Bell and Tisdel magneto instruments were used as receivers with it.

Q. Q. 138. State whether, during your recent tests, and while using "reproduced" "F" as a transmitter, and "E," "A," "reproduced" "B," the Tisdel instrument or the Bell instrument as a receiver, words, numbers or entire sentences were successfully transmitted through the line, and heard and understood by you?

Ans. There was no instance in any of the arrangements of instruments mentioned, when I failed to hear and understand articulate speech through instrument "F," the line and the receiving instrument, while listening at the last.

Necessarily, however, on account of the varying construction of the different instruments used as receivers, the proportion of words understood to that of words lost, as well as the relative clearness of articulation, varied. Using the comparatively crude instrument "B reproduced" as a receiver, I recognized and repeated words and parts of series of irregular numbers·

With instrument "A," the results obtained were almost phenomenal, in that I could distinctly recognize conversational speech, even in quite long sentences, although, strangely enough, I find difficulty in understanding selections read aloud into the transmitter from a newspaper.

Here are some sentences, which I read from the notes, which I heard distinctly through "F" and "A," and caused to be repeated back through the "tell-tale" line to the room from which they were transmitted, and where the notes were taken by Mr. Marx.

"What shall I do now? Shall I read to you something?"

"I will read again."

"Now listen while I talk. Do you hear that?"

"How plainly can you hear me?"

"Is now almost at its height."

"For his action in the Lamson case"

I have taken these sentences at random from the notes made in the back room, and I introduce them here merely to show the extent of the sentences that I clearly heard through "F" and "A."

The instruments "F" and "E" were not used together during the tests, although I tried them before the session on the morning of March 30th, and obtained through "F" and "E" rather better results than I afterwards obtained through "F" and "A." As "E" was subsequently fully tested in other connections, I did not think it necessary to include this trial among the tests. When "F" was used as a transmitter with a Tisdel magneto instrument as a receiver, sentences and words were received a little, though not much, better. Here are some of the sentences heard and repeated by me, and taken down by the stenographer in the front room:

"Have you heard of Judge Wallace's appointment? How do you like it?"

"Shall I read an article to you now?"

"How far can you understand what I say?"

I was, and am still, of the opinion that the Tisdel hand instrument used was somewhat out of adjustment, owing to rough handling, as it did not receive speech as clearly as the other instruments of the same kind which I used in my previous tests at Eberly's Mills. I took the Tisdel instrument off the line, after using it for quite a short time with "F" as a transmitter, and substituted a Bell instrument, through which I received in the front room the following sentences spoken into "F" in the back room.

The following are some of the sentences heard:

"Dan Drawbaugh is standing by my side."

"Do you like a Bell receiver better than a Tisdel?"

"Do you get it better now than before?"

"Do you think you can hear reading?"

"I will read something from the paper."

"I said, 'Repeat what you read, so that I can see whether you get it right or not.'"

"Why the devil can't you hear me when I read as well as when I talk?"

The whole test of this instrument "F" with a Bell instrument was, in fact, a constant trial for adjustment. Some of the results were very striking. Several times I heard short sentences, such as "Do you hear me now?" or others of a conversational nature, with absolute clearness and distinctness of enunciation. At times again the sounds would be very faint and far off, although the inflection of the voice could always be recognized. At one time the adjustment was such that the sound emitted by the receiving instrument was so loud as to make it painful to hold the instrument to the ear. These sounds I continued to hear coming from the receiver, even when I held the latter off at arms length. Of course, when these sounds were so exceedingly loud, articulation could not be clearly distinguished, although it was possible to recognize frequently the inflections of the voice. When I couldn't understand the words transmitted through instrument "F," the sound that reached me at the receiving instrument very much resembled the speech of Edison's phonograph. Vocal sounds were there, and the shape of the words, so to speak, could be distinguished, but the articulation wasn't clear enough for certain recognition of the words.

I think these tests demonstrated very conclusively the remarkable delicacy required in the adjustment of "F"; for the reason that the capacity of the instrument seems to range between the production of sounds loud enough to be heard at three feet distance, perhaps, from the receiving instrument, to those barely audible in the latter; and the change from one extreme to the other is effected by the movement of an adjusting-screw over an infinitesimal fraction of an inch. The difficulty of hitting an exact adjustment between these extremes, which shall give the requisite loudness, and at the same time the greatest possible clearness of articulation, will, I think, now be evident; although there is apparently a wide range of adjustment on each side of this best one, when the instrument will transmit articulate speech with sufficient loudness and clearness for practical purposes.

Q. Q. 139. Along towards the close of the test with Drawbaugh's instrument reproduced "F" as a transmitter, in the back room, and the Bell magneto instrument as a receiver in the front room, on the third day of the recent tests here, you complained through the "tell-tale," that the person who was speaking into instrument "F," was speaking too loud, whereupon said person, during the remainder of the tests with those two instruments on the line, spoke in a tone but slightly louder than a whisper; that is to say, in a very low tone, would only be audible a very few feet in the open air. When commencing to use this tone, he told you through the instrument, that he was speaking not much above a whisper, and thereafter, he continued to speak in that tone to the end of the test.

TELEPHONE COMPANY,-2

[*The examiner certifies that he was present at the time, and that the above statement, as to the tone of voice used by the person operating the instrument reproduced "F" towards the close of the tests on the third day, is substantially correct.*]

Q. Q. 140. Now, after the person speaking into "F," adopted, and while he was using this low tone of voice, but little above a whisper, in the transmitting instrument reproduced "F," did you hear any words and sentences come clearly through the line? If so, will you give an account of it, and state some of the sentences which you so heard?

Ans. After the sounds which I received through the instruments "F reproduced" and the Bell apparatus became very loud, as I mentioned in my previous answer, I could not tell whether the continued excess of loudness was due to the person shouting in the transmitter, or to the peculiar adjustment of that instrument. Consequently, when I continued to receive the speech too loud, I kept sending back instructions through the "tell-tale" line, for the person speaking into the transmitter to use a lower tone of voice. I read from the notes of Mr. Donahoe taken in the front room, where I was, the following conversation received by me through the "F" and Bell instruments, and repeated, and answers sent back through the "tell-tale" line.

Paragraphs marked H. indicate the speech I heard. Paragraphs marked B. indicate the answers I sent back through the "tell-tale" line.

"H. I am speaking very low indeed. Can you hear me read in this tone? What do you think about it?

B. Try it.

H. Well, what do you think about it?

B. Try it. Don't speak so loud.

H. Well, what do you think about it now?

B. That's better.

H. I am speaking; do you hear me?

B. Go on and read—

H. (Not understood.)

B. Repeat that, please.

H. (Again not understood.)

B. I didn't get the last part of it.

H. (Again not understood.)

B. No, the instrument breaks.

H. I said, I am speaking not much above a whisper.

B. I got that clearly.

H. (Not understood.)

B. Too loud; it will take my ear off.

H. (Not understood.)

B. Go on, and read very low.

H. I want to see whether you hear. Do you hear?

B. Yes.

H. Well, shall I read now?

B. Yes, go ahead very low.

H. I read from the *New York Tribune* of yesterday.

B. Go on.

H. (Not understood.)

B. I didn't get all of that. Try it again.

H. I said: 'Repeat what I read, so that I can see whether you get it right or not.'

H. Well, now I will read.

H. (Not understood.)

B. Repeat.

H. (Not understood.)

B. Repeat again.

B. Go ahead with your reading.

H. (Not understood.)

B. No.

H. (Not understood.)

B. No.

H. Tell the man at the telephone to speaker louder to Mr. Ott."

(This last remark was by way of instruction to Mr. Marx, who was transmitting my answers through instrument "F" and the "tell-tale" line, to Mr. Ott, who was then listening at the Bell instrument at the other end of that line.)

"H. Well, I am going to read a little. Do you hear that?

B. Go on.

H. (Not understood.)

B. No.

H. I will read something about Ben Butler.

H. (Not understood.)

B. No.

H. Benjamin F. Butler, of Massachusetts.

H. (Reads something which he repeats, as requested, four times, and is still not understood.)

H. Why the devil can't you hear me when I read, as well as when I talk ?

H. Halloa.

H. (Says something which is repeated twice but is not understood.)

H. Do you hear that ?

B. No.

H. (Says something, which is repeated twice, but not understood.)

H. I am not talking louder than above a whisper.

H. Well, you got that pretty straight.

H. (Not understood.)

B. No.

H. It is expected.

B. Got "it is expected." Did not get the rest.

H. Of the telephone.

H. (Not understood.)

B. No.

H. (Not understood.)

B. No.

H. (Not understood.)

B. No.

H. (Not understood.)

B. No.

H. Well, can you hear me now ?

B. Yes.

H. (Not understood.)

B. No.

H. It is expected that.

B. Heard 'it is expected that.' The rest sounds like 'Judge Blatchford.'

H. (Not understood.)

B. Say it again.

H. Who is talking into the other machine ?

B. Marx is.

Adjourned until Monday, April 3d, 1882, at ten o'clock, A. M.

Monday, April 3d, 1882, *ten o'clock,* A. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

Re-direct examination of Mr. Park Benjamin by Mr. Hill continued.

Q. Q. 141. State whether any and what tests you made on March 28th, 29th, or 30th, with the Drawbaugh instruments "reproduced" "C," or "reproduced" "I," or either of them, and what were the results?

Ans. On March 28th, Drawbaugh's instrument "reproduced" "C" was attached to the line, in the back room, and I listened at Drawbaugh's instrument "reproduced" "I," attached to the same line, in the front room. I heard words and sentences, while so listening, and repeated the same aloud as I so heard them; in order that they might be subsequently verified by the aid of the "tell-tale" line.

It should not be understood, that I received speech uninterruptedly through "C" and "I," or as clearly and distinctly as I afterwards received it through "H" and "A," or "H" and "E," for example, but I did clearly recognize, understand and repeat spoken words and sentences, and thus demonstrated beyond any question the capability of the apparatus to transmit and receive articulate speech by the electric current.

Q. Q. 142. During your recent tests, on any of said three days last mentioned, did you use the Drawbaugh instrument "O"? If so, in what manner, and with what results?

Ans. I did. Instrument "O" was attached in the rear room, and I attached various receivers to the end of the line in the front room, and there listened. The following is taken from notes made in the front room, by a stenographer, of the speech received and repeated by me at that end of the line. Instrument "O" having been attached in the back room, and a Tisdel magneto instrument being applied in the front room, I listened at the latter, and heard as follows:

"H. Yes, I get you distinctly. Do you get me distinctly now?

H. Benjamin, do you hear me now?

B. Yes.

H. Repeat what I say. This is the instrument "O" on the line. Shall I read you a newspaper article?

B. Yes.

H. I will read from the *Boston Daily Advertiser*, of March 27th—not March 27, but March 22nd. Now listen. 'The New York Court experiences much difficulty in attempting to suppress policy-shops, a form of lottery in which Judge Cowing, who addresses the jury—'"

(The Tisdel instrument was now taken off the receiving end of the line, and the Bell hand magneto instrument put on in its place, when I heard as follows:)

"H. Yes. Shall I read again? 'The New York Courts experience much difficulty in attempting to suppress policy-shops, a form of lottery in which Judge Cowing, in addressing the jury, declares, gives not even a shadow of a chance to those who patronize them. Three cases in succession have resulted in a disagreement of the jury, and the Judge confesses that these shops would become soon an unbearable evil if—

B. Repeat.

H. —evil if complaints ended in failure to secure a verdict. The statute and the jurymen evidently both need amending.' That is all of that article."

(Instrument "A" was now put on as a receiver.)

"H. What instruments have you on now?

I will count a few numbers to get the right sound and distance—1-2-3-4-5-6-7-8-9-10. Do you hear that?

H. That is right now. Now I will read from a newspaper. 'General Grant and his wife arrived at the White House to-night on their visit to the President. John Russell Young, the newly appointed minister to China, came with them. Owing to the President's numerous engagements he finds it impossible to give a reception to the Massachusetts—now in the city.'

H. 'It appears to be as certain as anything of the kind can be—'

B. No.

H. '—That Senator Henry M. Teller, of Colorado, is to be appointed Secretary of the Interior. When it was first intimated among the knowing ones that the Western man, who had not been mentioned in connection with a Cabinet position, was to be given that department, there was at once much curiosity in the matter. While the Senator does not affirm or deny the truth of the report, the matter has been pretty thoroughly canvassed during the few days, and the conclusion is that there is no doubt about it. Mr. Teller is now serving his second term, and is nearly at its end. He will go into the Cabinet.'

B. No.

H. He will go into the Cabinet.

B. No.

H. 'If he goes into the Cabinet—'

B. No.

H. 'If he goes into the Cabinet—'

B. No. That last was too weak. Make it stronger.

B. No.

B. No.

H. It will not be—That was not right. 'If he goes into the Cabinet he may not—'

B. Repeat.

H. 'He may not see.

H. He may not seek a good connection—may not seek a re-election. On the other hand his chances of re-election are good.'

B. Try it again.

B. No.

B. Give the whole clause.

H. 'It may affect his chances of re-election—'

B. Something.

B. Not right.

H. 'He may think his chances of re-election improved. He is a man of fair, but not distinguished, ability, very positive in his opinions, an industrious business man. His views on questions are pretty well known. Where he appears disposed to be just, he is not favorable to the proposition that has lately received attention, and appears to be growing in favor. He is strongly opposed to the measure.'

B. Repeat.

H. 'He is strongly opposed to the measure for giving the Indians lands in severalty—for giving the Indians lands in severalty.'

B. That sentence begins with the words "last winter."

H. Now I will go on with the next sentence."

Q. Q. 143. In the ordinary business of the electric speaking telephone, as now known and used for business purposes, is it required to transmit newspaper articles, or is it mainly used for conversational purposes, asking and answering questions?

Ans. Mainly for conversational purposes. I don't know of any more severe test that can be applied to the instrument than that of transmitting newspaper articles; for the reason that such a test not only involves the accurate transmission by the apparatus of the articulate sounds uttered into it, but, to a large extent, the acuteness and readiness of the person receiving to recognize them. It is a well-known fact, I believe, that in ordinary conversational speech but a comparatively small percentage of the words in the language are used. These words become so familiar to the ear that we can recognize and understand them, even when greatly mispronounced, by a foreigner for instance; and under this same analogy a telephone, which would serve all practical purposes for conversation, might easily be found wanting in capacity to make clear to the listener proper names or words not in common conversational use. Nobody talks as a newspaper article reads, unless a previously prepared speech, or something of that kind, is being uttered. And obviously the number of unusual words employed by a writer in deliberately preparing an article is very much greater than those commonly used in every day talk. So also, in hearing an article read to him, a person listening loses greatly the aid of the inflections of the voice, which occur in conversation. In fact, the difficulty of understanding, in the two cases, is nearly as apparent when the words are simply spoken aloud in the person's hearing. Almost anyone, no matter how uneducated, can make himself intelligible in conversation, while to read a newspaper article, or in fact anything written, correctly, so as to convey its entire sense, as well as the proper sound of the words, requires a certain degree of skill. So far as my experience has gone with the telephone system in this city, and I have repeatedly talked over the lines, I very much doubt if an article as long as that, which I heard through Drawbaugh's instruments "H" and "E," could ordinarily be transmitted with as few repetitions and errors.

Q. Q. 144. Is it, or not, true that different persons possessing ordinarily good hearing differ considerably from each other in capacity to accurately hear and understand through a speaking telephone?

Ans. Undoubtedly; I think people differ just as much in their capacity to hear, as they do in their capacity to see or to speak; and I have found in my own case, and, so far as I can learn, the general experience is about the same, that even some little practice with the instrument is required to get the best results. I have met people, however, who apparently didn't hear through any telephone with any degree of certainty; and I have had others listening in turn with me at the same instrument who said that they couldn't distinguish what was said, while I myself heard and recognized every word. This happened in using Bell instruments.

Q. Q. 145. Mention any possible sources of error in the recent tests not properly chargeable to the working of the instruments themselves?

Ans. First, errors resulting from failure to catch and distinguish words, due to noises produced by people moving or speaking in the neighborhood of the instrument, or to the passing of heavy vehicles in the street. The sounds I obtained were frequently impaired by these causes. Second, involuntary bodily movements of the person listening, such as a chance cough, or impairment of hearing due to a cold, or not happening at the moment to have the instrument properly held to the ear. Third, the recorded results of the tests would be, and I think are to some extent, affected by errors in transmission through the "tell-tale" line. The words which I spoke aloud as I received them were repeated into the "tell-tale" line by one person, received by another, and taken down by a third; so that mistakes in understanding might readily occur, especially at the receiving end of that line. As a matter of fact, there were several times when from one cause or another repetitions were required through the "tell-tale" line. I think all of these disturbing causes should be taken into consideration and given proper weight in estimating the final result of the tests.

Q. Q. 146. On one occasion, when Mr. Pope went to the receiving instrument in the front room, and after he had been listening some time and reporting what he heard, the line went suddenly out of operation, to the surprise of the parties in the back room who were transmitting, and after several ineffectual efforts to re-establish communication with Mr. Pope through the line, somebody was sent to the front room to investigate the matter, and it was then discovered that Mr. Pope had accidentally short-circuited the line in some way. Do you know anything about that?

Ans. I think I was in the rear room when that happened, and Mr. Pope at that time was using Drawbaugh's instrument "E" on the test line, in the front room. I instructed the messenger to tell Mr. Pope to look at the uncovered wires, which connected the test line with the instrument, and see whether these were not in contact, thus short-circuiting the line and cutting the current off the instrument. I understood that he so found them, and at once rectified the difficulty. We afterwards wrapped the wires around the case of the instrument and fastened them with string to prevent a recurrence of the accident. The same thing happened to me once while I was using the instrument "E." I think we fastened the wires with string, as stated, on the afternoon of the second day, or morning of the third day, before beginning.

Q. Q. 147. In all these tests of the Drawbaugh instruments, on March

28th, 29th and 30th, what was demonstrated as to their capacity, respectively, to transmit by means of the electric current, the three characteristics or essential conditions of spoken speech; to wit, the variations in "quality," "pitch" and "loudness"?

Ans. In my opinion these tests have demonstrated conclusively the entire capability of all of Mr. Drawbaugh's instruments experimented with to transmit "pitch," "loudness" and "quality" of sound.

Q. Q. 148. In connection with the instrument "F," which requires a very delicate adjustment, did anything occur to confirm the opinion in which I believe the experts on both sides agreed, that an instrument which makes and breaks the electric circuit by means of the sound-waves will not, while so doing, transmit spoken speech intelligibly?

Ans. Yes; on some occasions, while adjusting instrument "F," especially while testing it with the Bell instrument as a receiver, so slight a contact was produced between plate and carbon that the motion of the diaphragm under the influence of the voice would, at times, cause complete separations of said plate and carbon, these separations occurring at very rapid intervals. When this happened the sounds received were entirely unintelligible, being a mere series of noises, often very loud and abrupt.

Q. Q. 149. While you were using the Drawbaugh instruments on the test line did you at any time recognize, through the instruments, the difference in the voices of the persons transmitting in the back room, or the fact that one person had been substituted for another at the transmitting instrument?

Ans. Yes, I recognized quite clearly, for example, the difference between the voices of Mr. Hill and Mr. Drawbaugh, and on one occasion when Mr. Drawbaugh took the place of Mr. Hill at the transmitter, I discovered the fact by the difference in their voices without any other knowledge. I did not make such full tests on this point during the regular trials as I did during some previous experiments, which I conducted while we were repairing the instrument. Then I caused two persons to talk and count into the same instrument alternately, and I found I could distinguish their voices, so as to tell afterwards what each person had said. I did this using instruments "E" and "H," and "E" and a Klemm transmitter; also, I think, with instrument "A" and a Klemm transmitter, and with some others that I don't recall.

[*Mr. Hill offers in evidence the following newspaper articles, and parts of* *newspaper articles, which were used during the tests, the same to be marked respectively:*

Re-cross examination by Mr. Storrow:

Re-cross-Q. 150. You read some passages from the long-hand notes of Mr. Marx, and the short-hand notes of Mr. Donahoe. Please let me see those notes from which you read?

Ans. Here they are.

[*Witness hands the notes to Complainants' counsel.*

Complainants' counsel requests the examiner to mark them for identification, and to furnish Complainants' counsel with a copy of them at Complainants' expense.

Defendants' counsel states that notes were taken also on the part of Complainants in both the front and back rooms, and he requests Complainants'

ELEPHONE COMPANY,-2

counsel to furnish him, Defendants' counsel, with a copy of said notes at Defendants' expense.]

Examination taken, reduced to writing, and by the witness subscribed and sworn to before me, this third day of April, 1882.
FRED. M. OTT,
Examiner.

PARK BENJAMIN.

Mr. Hill inquires whether Messrs. Watson and Bell are available for cross-examination at this time.

Mr. Storrow states that those gentlemen are living abroad; that he has heard a rumor that both of them are expected to be in this country in the course of a month; that he understands that Mr. Hill has a right to cross-examine both of them if, and when, they do return, at any stage of the case, and that when he learns of their return, he will notify Mr. Hill for that purpose.

Mr. Hill states that he reserves that right in closing his testimony.

Mr. Hill requests Complainants' counsel to reproduce the tests which are said to have been made at Boston with instruments embodying Professor Bell's alleged invention of the telephone in its earlier form, and if possible, with the identical instruments used in that test. He refers to that test of which evidence has been given on the part of the Complainants, as having been made at No. 40 *State street, Boston, Massachusetts, and elsewhere, for the purpose of demonstrating the capacity of those earlier forms of instruments to transmit articulate speech. And Mr. Hill desires an opportunity to have his expert present at such tests, and, if he shall then elect to examine his expert as to such tests, he wishes to reserve the right so to do.*

Mr. Storrow states, that said instruments all have membrane diaphragms, and were made about three years ago; that they have been used in various suits; and that many, or all of them, have become broken; but that he has intended to invite the Defendants to witness tests of the character referred to, and will do so.

Mr. Hill states, that, with the reservations above noted, Defendants now close the evidence in support of their answer.

This deposition has been begun within the time limited for Defendants to close their testimony, and it is now agreed that it shall stand with the same effect as if completed within that time.

AMERICAN BELL TELE

Dauphin County, } ss:
State of Pennsylvania. }

I hereby certify that the foregoing depositions of witnesses, on behalf of Respondents, were begun at Harrisburg, Dauphin county, aforesaid, on the nineteenth day of April, A. D., 1881, and continued by adjournment, to the times and places set forth, in the foregoing record; and that the several witnesses were duly qualified by me, and subscribed their several depositions in my presence, as above set forth.

Witness my hand and seal, this 28th day of April, 1882.

EPHONE COMPANY,-3

Circuit Court of the United States,

SOUTHERN DISTRICT OF NEW YORK.

IN EQUITY.

AMERICAN BELL TELEPHONE COMPANY ET AL.
v.
THE PEOPLE'S TELEPHONE COMPANY ET AL.

BILL OF COMPLAINT.

To the Honorable the Justices of the Circuit Court of the United States for the Southern District of New York:

The American Bell Telephone Company, a corporation
duly established under the laws of the Commonwealth of
Massachusetts, and the Metropolitan Telephone and Telegraph
Company, a corporation duly established under the
laws of the State of New York, bring this their bill of
complaint against the People's Telephone Company, a
corporation organized under the laws of the State of New
York, Joseph Loth, Julius Bien, Marcus Marx, Auguste
H. Girard, John N. Goodwin, Frank A. Klemm, and
Ernest Marx, all of the city and State of New York; 1
Edgar W. Chellis, of Harrisburg, in the State of Pennsylvania,
Richard C. McCormick, of the Territory of
Arizona, Henry D. Cook, Jr., of the city of Washington,
in the District of Columbia, Max L. Gutmann, of
Rochester, in the State of New York, Moritz Loth, of
Cincinnati, in the State of Ohio, and Simon Wolf, of
Washington, in the District of Columbia. And thereupon
your orators complain and say, that before the seventh
day of March, 1876, Alexander Graham Bell, then of

AMERICAN BELL TELEPH

2 Salem, in said Commonwealth, being the original and
first inventor of a new and useful improvement in telegraphy,
which was never known or used before his invention
thereof, and which had not at the time of his application
been in public use or on sale for more than two years,
made application according to law for Letters Patent of
the United States to be granted to him therefor, upon
which application, due proceedings being had in all respects,
said Letters Patent were on the seventh day of
March, 1876, granted, issued and delivered to said Alexander
3 Graham Bell, signed by the Secretary of the Interior
and countersigned by the Commissioner of Patents and
numbered 174,465, whereby there was secured to said
Alexander Graham Bell, his heirs, administrators or assigns,
for the term of seventeen years from the seventh
day of March, 1876, the full and exclusive right and liberty
of making, constructing, using and vending to others to be
used, the said improvement, a description whereof is given
in the words of the said Bell, in the schedule annexed to
said patent, and forming a part thereof, as by said patent,
4 numbered 174,465, or a copy thereof here in court to be
produced, will fully appear.

That before the thirtieth day of January, 1877, the said
Alexander Graham Bell, being the original and first inventor
of another new and useful improvement in electric
telegraphy, which was never known or used before his invention
thereof, and which had not at the time of his application
been in public use or on sale for more than two
years, made application according to law for Letters Patent
of the United States to be granted to him therefor; upon
5 which application, due proceedings being had in all respects,
said Letters Patent were, on said thirtieth day of January,
1877, granted, issued and delivered unto said Bell, signed
by the Secretary of the Interior and countersigned by the
Commissioner of Patents, and numbered 186,787, whereby
there was secured to said Bell, his heirs, administrators or
assigns, for the term of seventeen years from the said
thirtieth day of January, 1877, the full and exclusive right

EPHONE COMPANY,-3

and liberty of making, constructing, using and vending to others to be used, the said improvement, the description whereof is given in the words of said Bell in the schedule 6
annexed to said last-named patent, and forming a part thereof, as by said patent, numbered 186,787, or a copy thereof, here in court to be produced, will fully appear.

That said Alexander Graham Bell assigned said Letters Patent, numbered respectively 174,465 and 186,787, to Gardiner G. Hubbard, trustee, by deed of assignment dated July 9, 1877, and recorded at the Patent Office July 28, 1877, liber R^{21}, page 399 of Transfers of Patents. That said Gardiner G. Hubbard, trustee, assigned said Letters Patent, numbered respectively 174,465 and 186,787, 7
to the Bell Telephone Company, by assignment dated July 20, 1878, and recorded at the Patent Office, Oct. 3, 1878, liber Y^{22}, page 460 of Transfers of Patents.

That said Bell Telephone Company has granted the same to your orator, the American Bell Telephone Company, by an instrument in writing, dated June 22, 1880, and recorded at the Patent Office, June 24, 1880, liber I^{25}, page 282 of Transfers of Patents.

That the sole right to manufacture electro-speaking telephones under said patents thereby became and still is 8
vested in the said American Bell Telephone Company; that the only right granted to or possessed by any persons other than the said American Bell Telephone Company under said patents has been and is the right to use telephones procured from said American Bell Telephone Company, and its predecessors, upon payment of stated royalties under said two patents to the said American Bell Telephone Company.

That by license under said American Bell Telephone Company, the Metropolitan Telephone and Telegraph 9
Company, a corporation organized under the laws of the State of New York, has acquired the sole and exclusive right to use and to license others to use telephones within a territory which includes all the States of New York and New Jersey within thirty-three miles of New York City

Hall, and all of Monmouth County, New Jersey, and all of
Long Island, and is now engaged in the business of supply-
ing electric speaking telephones and erecting telephone
lines in said territory; which telephones it receives from
10 said American Bell Telephone Company, and for the use
of which it pays a yearly license fee and royalty to said
American Bell Telephone Company, and receives a yearly
royalty and license fee from its sub-licensees.

That electric speaking telephones had never been pub-
licly known or used before the grant of said patent, and were
first publicly made known and first introduced into public
use by said Bell and his licensees under said Bell patent,
and but for the unlawful acts of the defendants and
their associates, hereinafter complained of, your orators
11 would be in the full and exclusive enjoyment of said rights.

Your orators further show, that after the grant of said
Letters Patent, the inventions therein described and
claimed, or substantial and material parts of the same, em-
bodied in instruments known as Bell telephones, and in
instruments known as Blake transmitters, were, before
July, 1877, introduced into general public use by the
said Bell, the said Hubbard, trustee, the said Bell Tele-
phone Company and your orators. That many thousands
of persons have put the said invention into daily use
12 under the authority and license of the said Hubbard and
your orators and their predecessors and those holding
rights or licenses under them, and have paid for such
use of said inventions the amount fixed by the owners of
said patents as a reasonable compensation therefor, such
payments amounting in the aggregate to many thousands
of dollars. That telephone exchanges now exist in more
than two hundred and seventy-five towns and cities of the
United States, and in every State thereof, and exist in sub-
stantially every city in the United States having more than
13 15,000 inhabitants, and in many smaller places; and all
said exchanges use telephones licensed by your orators, the
American Bell Telephone Company, and its predecessors,
as owners of said Bell patents, and pay royalty therefor

LEPHONE COMPANY,-3

to your said orators. That the fact that said Bell was the original and first inventor of said inventions, and that the patents above named are good and valid patents, have been generally recognized and acknowledged by those who have used the inventions and the public generally, in all parts of the United States, and the claims of the said Bell, Hubbard, and your orators and their said prede- 14
cessors to the exclusive right to the said inventions under said patents have been generally acknowledged and acquiesced in. That from time to time several persons have attempted to make, sell and use telephones, or parts thereof, embracing said inventions, but that in such cases said Hubbard while owner of, and your orators, and their said predecessors, since they have owned said patents, have immediately, upon hearing of such acts or attempts, notified such parties to desist therefrom, and that such parties have generally, upon receiving such notices, complied therewith, 15
and acquiesced in and recognized as valid the claims of said Hubbard and your orators under said patents; and said Bell, said Hubbard and your orators have always asserted and maintained, and but for the wrongful acts of the defendants would and have hitherto almost universally enjoyed the sole and exclusive right to practise said inventions: that they have not acquiesced in any infringement of their exclusive rights; and that the said exclusive rights of your orators are of great value to them.

That there are now in use more than 100,000 electric 16
speaking telephones licensed by and paying royalty to your orators, the American Bell Telephone Company; that the owners of said Bell patents, and those who now are or heretofore have been licensed by them, have devoted great time and attention and large sums of money to the development of the telephone and the introduction thereof into extensive use, and to the proper construction of the most suitable telephone lines and systems, and telephonic appliances, and have constructed many thousand miles of telephone lines for use with telephones owned by your orators, 17
the American Bell Telephone Company, and licensed by it

AMERICAN BELL TELEPH

for such use, and that nothing which the defendants, or F. A. Klemm, A. G. Tisdel, and D. A. Drawbaugh (hereinafter named) have done, has contributed in any substantial way to the development of the telephone, or the introduction thereof into use.

That in the year 1878 Addison D. Hard, of Boston,
electrician, infringed said Bell patents by making and
selling telephones, or by making and selling the material
18 and substantial parts thereof for the purpose of being put
together and used as telephones; that thereupon the said
Bell Telephone Company brought their bill in equity
against him, in the Circuit Court of the United States for
the District of Massachusetts; that an injunction was
issued against him to desist from such infringement; and
afterwards, and after hearing, the defendant was adjudged
in contempt for violating said injunction, and was ordered
to pay a sum of money into court, which sum was afterwards,
to wit, Feb. 4, 1879, ordered to be paid, and was
19 paid to said Bell Telephone Company.

That in the year 1878 one Jerome C. Redding also infringed said patents, and a bill in equity was brought against him in said court to restrain said infringement, and no defence was made, and an injunction issued, and said Redding desisted from further infringement.

That in the year 1878 one Jesse H. Bunnell, manufacturing
electrician, did, in the city of New York, in like
manner infringe said Bell patents; that thereupon the said
Bell Telephone Company brought their bill in equity
20 against him in the Circuit Court of the United States for
the Southern District of New York; that he appeared
thereto by counsel; that thereafter he submitted to the
claims of the plaintiff; and that on the eighth day of
February, 1879, an injunction was issued against him,
restraining him from further infringement of said patents,
and no further proceedings have been had in said cause.

That in the year 1878 Charles E. and William H. Jones, manufacturing electricians, did, in the city of Cincinnati, in like manner infringe said Bell patents; that thereupon the

LEPHONE COMPANY,-3

said Bell Telephone Company brought their bill in equity 21
against them in the Circuit Court of the United States for
the Southern District of Ohio, on said two patents; that
they appeared thereto by counsel; that thereafter they submitted
to the claims of the plaintiff; and that on the thirteenth
day of December, 1878, a decree and injunction was
issued against them, declaring the validity of said two Bell
patents, and restraining them from further infringement
thereof, and ordering an account of damages and profits;
and no further proceedings have been had in said cause.

That in the year 1880, Pearce & Jones, manufacturing 22
electricians, did in the city of New York infringe said
Bell patents, by making and selling instruments of the
form and character known as magneto-telephones, and
which operated by varying the electro-motive force by
magnetic induction, and by making instruments of the
form and character known as battery telephonic transmitters,
which operated by varying the resistance of a circuit
supplied with electro-motive force from a battery; that
thereupon your orators brought their bill in equity against
them in the Circuit Court of the United States for the 23
Southern District of New York, and moved for a preliminary
injunction on said two patents; that they appeared
thereto by counsel, and asked for additional time to prepare
affidavits in defence to said motion; that the Court thereupon
ordered an injunction or restraining order to issue,
and allowed said defendants further time to file affidavits,
with leave to have a hearing thereon on a day named; that
on said day named, to wit, Aug. 10, 1880, the said
defendants appeared by counsel and declined to contest
said case further, and submitted to a decree declaring the 24
validity of said two patents, and perpetually enjoining
said defendants from infringing the same, and ordering an
account of damages and profits; and that such decree was
made by order of said Court, on or about the tenth day of
August, A. D. 1880; and such injunction was ordered
and issued accordingly by order of said Court, on the
eleventh day of September, A. D. 1880; and no further
proceedings have been had in said cause.

That in the year 1880, the Eaton Telephone Company,
25 a corporation established under the laws of the State of
New York, did in the city of New York in like manner
infringe said Bell patents, by making and selling instruments
known as magneto-telephones or telephonic battery
transmitters as aforesaid; that thereupon your orators
brought their bill in equity against it and others in the
Circuit Court of the United States for the Southern District
of New York on said patents, and moved for a preliminary
injunction; that said motion came up for hearing
on Aug. 10, 1880; that thereupon said defendants appeared
26 by counsel and asked for further time to file affidavits in
defence to said motion, which time was allowed them until
Sept. 15, 1880; and on said day said defendants declined
to file and did not file affidavits, and declined to contest
said motion, and thereupon a preliminary injunction was
ordered and issued against them restraining them, their
agents and servants, from infringing said patents; and no
further proceedings have been had in said cause.

And at or about the same time your orators the American
Bell Telephone Company brought their bill in equity on
27 said two patents in the Circuit Court of the United States
for the District of Massachusetts, against Albert Spencer,
an agent and employé of said Eaton Telephone Company,
and against Enoch Waite, a user of telephones made by
said Eaton Telephone Company; said Waite declined to
contest said suit; said Spencer appeared by counsel and
asked for and obtained time to prepare and file affidavits,
and thereafter declined to file affidavits, and submitted to a
preliminary injunction in like manner as said Eaton Telephone
Company did as aforesaid.

28 That in the year 1880, one J. L. Lazelle, a manufacturer
of electrical apparatus in the city of New York, did,
in the city of New York, in like manner infringe said
patents by making and selling magneto-telephones called
the Lazelle telephone, and by making and selling battery
transmitting telephones, called the Little Gem Transmitters;
that thereupon your orator brought its bill in equity against

LEPHONE COMPANY,-3

said Lazelle, in the Circuit Court of the United States for the Southern District of New York, on said patents, and moved for a preliminary injunction; that said motion came up for hearing on the day of October, 1880; that the said 29
defendant made default, and thereupon an injunction was ordered and issued against him, restraining him, his agents and servants, from infringing said patents; and no further proceedings have been had in said cause.

That all said orders and decrees stand in full force and effect.

That none of said parties so enjoined as aforesaid have been licensed under said Bell patents, and, as your orators believe, they have entirely refrained from making and selling and using telephones, or in any way infringing said patents 30
since the making of said decrees respectively.

That the said exclusive rights of said Bell, and your orators and their predecessors as his assigns and grantees, have never been openly or publicly violated, except at one time and in the year 1878, by the Western Union Telegraph Company, and by the Gold and Stock Telegraph Company, and by the American Speaking Telephone Company, said three corporations having associated themselves together for that purpose; that said Bell Telephone Company brought its bill in equity in the Circuit Court of the United States for 31
the District of Massachusetts, against Peter A. Dowd, an agent of said associated companies, engaged in the business of using their infringing telephones, and in said suit complained of the defendant that he had infringed the fifth claim of said patent 174,465; and also complained that he had infringed the third, sixth, seventh and eighth claims of said patent 186,787; the said associated corporations assumed the defence of said suit, and employed in said defence their counsel and experts learned in the law and skilled in the art; in said suit evidence was 32
taken and completed by the complainants in chief, and by the defendant in defence, and by the complainants in reply; and thereupon, upon consideration of said proof, and the opinions of their professional advisers, the defendant and

AMERICAN BELL TELEPHO

said corporations became satisfied that said Bell was the
true, original and first inventor of the electric speaking
telephone, and the inventions covered by said patents;
whereupon they submitted to the said claims of the com-
plainants, and agreed to desist from further infringements,
33 and have since desisted from further infringements, and
placed and caused to be placed all telephones within their
power or control under license under said Bell patents, and
paid, or caused to be paid, the usual and customary yearly
royalties therefor habitually charged by the assigns of said
Bell to other parties for like uses, and agreed that they
would not thereafter make electric speaking telephones,
and would not thereafter use electric speaking telophones,
except such as should be made and furnished to them by
your orators or the assigns of said Bell, and under license
34 under said Bell patents, and that for the use of the same
they should pay not less than the usual and accustomed
royalties from time to time charged to others by your
orators.

And your orators show that the telephones made by your
orators and the infringing telephones of the defendants are
small instruments, and easily concealed, and easily used
in private, and easily transferred from one person to an-
other, so that it is generally extremely difficult for your
orators to detect all instances of such use and extremely
35 difficult to prove the use thereof by persons not licensed by
your orators, and the extent of such use, and would be
extremely onerous and burdensome for your orators to
bring separate suits against each user to restrain said in-
fringing use; and so, if the defendants, or any of them,
shall be allowed to continue to manufacture and supply
such instruments for use during the pendency of this suit,
your orators will be wholly without adequate remedy in
the premises.

Yet the defendants, well knowing the premises and
36 the exclusive rights of your orators as aforesaid, but con-
triving to injure your orators and to deprive them of the
benefit and advantage which might and otherwise would

accrue to them from said inventions, without the license or consent of your orators, and in infringement of the said patents, have, as your orators are informed and believe, made, sold and used telephones embracing the inventions secured to your orators in said Letters Patent, or substantial and material parts of them, and have used the several improvements secured to your orators by said patents, and are still using the said several improvements at the city of 37 New York, and divers other places within said district, and have furnished electric speaking telephones made by them to a considerable number of persons within this district, to be connected up, and used as electric speaking telephones for the transmission of articulate speech, by and according to the method secured to said Bell and to your orators by said patents, and still continue so to do; but precisely how long the defendants have made, sold and used the said several improvements, and to what extent they have made, sold and used them, your orators, for want of 38 a discovery thereof, do not know and cannot set forth, and they pray that the defendants may be compelled to set forth the same in their answer.

Your orators, upon information and belief, aver and charge that F. A. Klemm and A. G. Tisdel claimed to have made certain alleged improvements in electric speaking telephones, and applied for patents therefor; that the defendants Klemm, Wolf, Ernest Marx, and Moritz Loth acquired the ownership of said alleged inventions; that thereafter patents of the United States issued on said appli- 39 cations, or some of them, to wit, patent 227,270, dated May 4, 1880, to said four defendants on an improvement in telephonic battery transmitters, alleged to have been invented by said Klemm, and patent 227,861, dated May 18, 1880, to the same persons, on an improvement in magneto telephones, alleged to have been invented by said Tisdel; that after said purchase of said inventions the said defendants, being well aware that any electric speaking telephone apparatus which would embody said improvements would infringe your orators' said patents, and particularly the first 40

Bell patent 174,465, and thereafter, hearing that one Daniel
Drawbaugh, of or near Harrisburg, Pa., claimed that
he had made some experiments relating to electric speaking
telephones (which experiments if made were incomplete,
imperfect, unfruitful, and were long before abandoned),
entered into an arrangement with him to set up
and claim that he was the first inventor of the speaking
telephone, and to make application for a patent therefor.
And thereafter alleging and pretending that said Drawbaugh
41 was the original and first inventor of the electric speaking
telephone, and that electric speaking telephones had not
before such application been in public use or on sale for
more than two years with the knowledge and consent of
said Drawbaugh, they did, on or about the twenty-first day
of July, 1880, induce him to make and cause to be filed in
the Patent Office of the United States, an application for
a patent to issue to them as assignees of said Drawbaugh
as the first and original inventor of the electric-speaking
telephone, the said defendants well knowing at the time
42 that electric-speaking telephones had been in public use by
your orators and the licensees of your orators for more
than two years before said application; all of which claims
and pretences your orators charge to be wholly unfounded
and untrue.

And further to carry out their plans, the said defendants,
or some of them, did associate with themselves the other
individual defendants, and did, on or about the thirty-first
day of August, 1880, form or undertake to form a corporation,
under the laws of the State of New York, having
43 its principal place of business and office in the city of
New York, with a nominal capital of $5,000,000, called
"The People's Telephone Company," of which, by the
articles of association, the defendants, Edgar W. Chellis,
Joseph Loth, Julius Bien, Marcus Marx, Auguste H.
Girard, John N. Goodwin, Richard C. McCormick, Henry
D. Cook, Jr., and Max L. Gutmann, are declared to be
and in fact became the trustees and directors, for the declared
purpose of manufacturing, selling and using telephones,
under and in accordance with what they pretend

EPHONE COMPANY,-3

are the inventions and improvements of said Klemm, Tisdel and Drawbaugh. 44

Your orators aver and charge that the infringing telephones made and sold and threatened to be made and sold by the defendants conform to the improvements and forms alleged to have been devised by said Klemn and Tisdel before they knew of said Drawbaugh's alleged inventions, and do not copy or conform to the forms experimented with by said Drawbaugh as of his own invention.

And your orators aver that said pretended inventions of said Drawbaugh (if ever made by him) have not been 45
by him, or any one claiming under him, introduced into public use, and that knowledge thereof has been withheld from your orators, and from the public, except so far as they have been disclosed within the three months last past by certain newspaper publications.

Your orators aver and charge that the defendants, or some of them, caused to be published the following newspaper articles, or furnished for publication the matter therein contained, on or about the date of the publication thereof:

[*From the Cincinnati Commercial of July* 22, 1880.] 46

"TELEPHONE COMBINATION.

"*Special to Cincinnati Commercial.*

"WASHINGTON, D. C., July 21. — An application for a patent was filed to-day that, in consequence of its vastness of interest, as well as wealth of prospect, renders it a subject of national interest. A company of leading business men had been formed, that has bought up all the telephone patents antedating those now in use, and known as the Bell, Gray and Edison patents. The company is composed of leading business men from all parts 47
of the country, Cincinnati being largely represented and interested. The cash capital of the company is $5,000,000, with headquarters in New York, and in about sixty days they will open up the telephone, which will certainly result in the driving out of all telephones in the market,

AMERICAN BELL TELEPH

save the ones they hold, or else the compelling the Gray,
Bell and Edison lines to pay the new company a munificent
royalty. It appears from the testimony now on file
and in the possession of the new company, which is conclusive
48 and exhaustive, that the inventor of the telephone
is a poor mechanic, living near Harrisburg, Pa., named
Daniel Drawbaugh. Owing to his poverty, he was unable
to push his patent on the market. The new company have
secured and are sole possessors of this invention, antedating
those now in use. They are alse owners of four patents
for telephones issued to Mr. Klemm, of New York.
A large number of capitalists were here to-day to see the
filing of the application, and they assert, with a positiveness
that is almost convincing, that it will not be long till
49 they have entire charge of the telephones, not only in this
country but in the world, and that they will be able to
establish lines by which messages can be transmitted for
almost a song."

"Mr. Lipman Levy, of the law firm of Moulton, Johnson
& Levy, of Cincinnati, was here to-day in the interest of
the Cincinnati parties, who, as already stated, are among
the most prominent financial men of our city."

[*From the New York Journal of Commerce of Monday, Aug.* 23, 1880.]

50 "A New Telephone Company. — A company has recently
been formed in this city with a capital of $5,000,000,
for the purpose of manufacturing telephones. The company
is to be known as The People's Telephone Company,
and a number of leading capitalists in this city and Cincinnati
are interested in it. The telephones are to be manufactured
under the patents of Frank A. Klemn and Abner
G. Tisdel, and the application for patents of David
Drawbaugh, of Eberly's Mills, Cumberland County, Pa.,
filed July 21, 1880. It is claimed by those interested in
51 the new enterprise that Drawbaugh is really the inventor
of the telephone, and had completed one years before Professor
Bell or any one else had manufactured one. He

EPHONE COMPANY,-3

was, however, in very humble circumstances, and his neighbors who knew of his experiments looked upon him as a harmless lunatic. He continued improving his original telephone, and it is claimed that the one which the new company proposes to furnish is superior to any now in use. The company has fitted up a factory in Brooklyn, and in three months will be prepared to supply 1,000 of the new telephones. As soon as operations are actively commenced, 52
it is expected that legal proceedings will be begun against the new company by the Gold and Stock Telegraph Company, which holds most of the existing patents, and a long and interesting legal fight is anticipated."

Your orators have requested the said defendants to acknowledge their rights in the premises, and to desist and refrain from the said acts, and from disregarding and infringing your orators' said rights, and to account with and pay to your orators what is justly due to your orators by reason of said infringement. 53

But now so it is, may it please your Honors, that the defendants wholly refuse so to do; but, on the contrary, continue and threaten to continue said infringement of the rights of your orators aforesaid, and particularly threaten to make and put out other like instruments, and thereby cause irreparable injury to your orators' lawful business. All which is contrary to equity and good conscience.

To the end, therefore, that the said defendants may if they can show why your orators should not have the relief herein prayed, and may upon their oaths, and according to their 54
best and utmost knowledge, remembrance, information or belief, full, true, direct and perfect answer make to all and singular the matters hereinbefore stated and charged, as fully and particularly as if the same were here repeated, and they especially interrogated as to each and every of said matters, and more especially may answer, discover and set forth whether during any and what period of time, and whether at said New York or elsewhere, and when and where they used said improvements, or either of them;

AMERICAN BELL TELEPHO

55 and whether they manufactured or sold any electric
speaking telephones or apparatus to transmit speech by
electricity, or the various parts of such telephones, and how
many they have made or sold, and to whom they have sold
the same, and how the said telephone and the several parts
of the same are constructed and used.

And your orators show that they are entitled to restrain
all further use of telephones which have been or shall be
manufactured and disposed of by the defendants or either
of them, and to receive and collect from each user thereof
56 a suitable sum as and for damages and profits in consequence
of and growing out of such use by each person who
has used the same; and not waiving said rights, but wholly
insisting thereon, and asserting that they intend to pursue
and enforce said rights against said users, your orators aver
that the defendants are also liable to pay to your orators
other sums as and for profits by them actually realized by
and from said infringement and unlawful acts. Wherefore
your orators pray that the defendants may be decreed to
account for and pay over to your orators all such gains and
57 profits resulting to them from said infringements; and may
be restrained, together with their servants and agents, by
an injunction, to be issued out of this honorable Court, or
by one of your Honors, according to the law in such case
provided, from making, selling or using the said improvements,
patented as aforesaid, or either of them; and that
they may also be enjoined and restrained as aforesaid, during
the pendency of this suit, and for such other and further
relief in the premises as the nature of the case may
require and to your Honors shall seem meet.

58 May it please your Honors to grant unto your orators
not only a writ of injunction but also a writ of *subpœna*,
to be directed to the said defendants and each of them,
commanding them and each of them, at a certain time and
under a certain penalty, therein to be limited, personally
to be and appear before your Honors and this honorable
Court then and there to answer unto this bill of com-

PHONE COMPANY,-3

plaint, and to do and receive what to your Honors shall seem meet in the premises.

REPLICATION.

CIRCUIT COURT OF THE UNITED STATES,

SOUTHERN DISTRICT OF NEW YORK.

IN EQUITY.

62 AMERICAN BELL TELEPHONE COMPANY ET AL.

v.

PEOPLE'S TELEPHONE COMPANY ET ALS.

The replication of the above-named complainants to the answer of the People's Telephone Company, Marcus Marx, Auguste H. Girard, John N. Goodwin, Frank A. Klemm, Richard C. McCormick, Julius Bien and Simon Wolf.

These repliants, saving and reserving unto themselves all
and all manner of advantage of exception to the manifold
63 insufficiencies of the said answer, for replication thereunto
say that they will aver and prove their said bill to be true, certain and sufficient in the law to be answered unto; and that the said answer of the said defendants is uncertain, untrue and insufficient to be replied unto by these repliants; without this, that any other matter or thing whatsoever in the said answer contained material or effectual in the law to be replied unto, confessed and avoided, traversed or denied, is true.

All which matters and things these repliants are and will
64 be ready to aver and prove as this honorable Court shall
direct, and humbly pray as in and by their said bill they have already prayed.

EVIDENCE FOR COMPLAINANTS.

TAKEN PURSUANT TO THE SIXTY-SEVENTH RULE OF THE SUPREME COURT OF THE UNITED STATES, IN EQUITY, AS AMENDED, BEFORE ME,

CHARLES H. SWAN, *Examiner.*

Boston, Feb. 16, 1881.

Present: James J. Storrow, Esq., *of Counsel for Complainants;*
Lewis Abraham, Esq., *of Counsel for such Defendants as have been served with Subpœna in this cause, or have heretofore appeared or answered.*

Counsel for complainants offers in evidence the following documentary evidence: —

An Office copy of Letters Patent No. 174,465, granted Alexander Graham Bell, March 7, 1876, and marked "Exhibit Bell Patent, No. 174,465."

An Office copy of Letters Patent No. 186,787, granted Alexander Graham Bell, Jan. 30, 1877, and marked "Exhibit Bell Patent, No. 186,787."

A certified copy of assignment, Alexander Graham Bell to Gardiner G. Hubbard, dated July, 1877, recorded in Book R^{21}, page 399, of Assignments of Patents.

A certified copy of assignment, Gardiner G. Hubbard to Bell Telephone Company, dated July 20, 1878; recorded Book Y^{22}, page 460, of Assignments of Patents.

A certified copy of assignment, Bell Telephone Company to American Bell Telephone Company, dated June 22, 1880; recorded Book I^{25}, page 285, of Assignments of Patents; marked "Exhibit Assignments."

[*Defendants' counsel admits the execution of the above assignments.*]

A certified copy of the charter of the American Bell Telephone Company, and a certified copy of the certificate of its organization, from the secretary of the Commonwealth of Massachusetts.

Complainants' Counsel also puts in evidence the instruments: "Complainants' Exhibit Klemm Battery Telephone, E. L. Bradley," and "Complainants' Exhibit Tisdel Magneto Telephone, E. L. Bradley," heretofore filed in this case, and referred to in the affidavit of Edward L. Bradley, and in the affidavit of Charles R. Cross, heretofore filed in this case, to be used upon an application for a preliminary injunction.

DEPOSITION OF CHARLES R. CROSS.

Direct Examination by JAMES J. STORROW, Esq., *of Counsel for Complainants.*

Int. 1. State your name, age, residence, and occupation.

Ans. Charles R. Cross; I am thirty-two years old; I live in Boston, and am Thayer Professor of Physics in the Massachusetts Institute of Technology.

Int. 2. State how long and to what extent you have been engaged in the study of the physical sciences; and to what extent, if at all, you have been accustomed to make experiments in the several branches of physics, especially those relating to electricity and acoustics.

Ans. I have been an instructor at the Institute of Technology

PHONE COMPANY,-3

during the past ten years, and during that time I have been constantly engaged in the study of various branches of physics. During the past eight years I have especially investigated the subjects of acoustics and certain branches of electricity. In the prosecution of my studies during this time I have constantly been engaged in the experimental study of the subjects mentioned, and have been practically familiar with all the apparatus ordinarily used by scientific men in the investigation of sound and electricity.

Int. 3. What attention have you given to the speaking telephone and to its principles and mode of operation?

Ans. I have been familiar with the rise and development of the speaking telephone from its very beginning, having been in frequent communication with Professor Bell ever since the winter of 1873–4. I am familiar with Mr. Bell's patents, have investigated with great care the theory upon which these patents are based; and am practically familiar with the construction and use of the various forms of instruments constructed in accordance with said patents. During the past two years, I have conducted a very extensive series of experiments relating to the different branches of telephony, in the capacity of expert for the Bell Telephone Company.

Int. 4. State whether or not you have testified as a witness in any cases in the courts of the United States upon the principles of the invention embodied in patents, and in machines or apparatus.

Ans. I have done so frequently.

Int. 5. You say you have been familiar with Mr. Bell's patents. State whether or not among these patents are those which have been introduced in evidence in this case marked "Exhibit Bell Patent No. 174,465," and "Exhibit Bell Patent No. 186,787."

Ans. The patents No. 174,465 and No. 186,787 are among those which I have had frequent occasion to examine.

Int. 6. Referring to the patent No. 174,465, will you explain the mode of operation of the apparatus referred to in the fifth claim of the patent; explaining, as far as may be necessary, the character of sounds, their action upon the apparatus, and the manner in which the apparatus operates to produce the results which are ascribed to it in the patent?

Ans. The sensation of sound is produced by the action upon the ear of the vibrating particles of air which are set into a vibratory, or to-and-fro motion, by the vibrations of the sounding body. The primary impulse given by the sounding body to those particles of air immediately in contact with it, is gradually transmitted from particle to particle, in consequence of the elasticity of the air, or other medium through which the sound passes. In consequence of the mode of action of the elasticity of the air, the motion originally communicated to the particles of air in contact with the sounding body is not transferred instantaneously to all the other particles; but in consequence of their *inertia*, as the sounding body vibrates to and fro, a similar movement is impressed upon one after the other of the particles surrounding it. This to-and-fro motion of the vibrating body generates a similar minute to-and-fro motion of the air particles, so that they are alternately crowded more closely together, and separated more widely from each other, thus producing alternate condensations and rarefactions in the air. It is to these alternate condensations and rarefactions that the term "sound wave" is given. It will be observed that each particle vibrates to and fro in a straight line in the direction in which the wave motion is propagated. If we consider that the vibration of the air particles is produced immediately by the vibration of the sounding body, we see that the motions of the air particles must be a perfect copy of the motions of the particles of the vibrating body. Such vibrations may differ in three separate ways, viz., in the extent of the path of the vibrating particle, in the frequency of its vibration, and in the character of its vibration. It is evident, in the first place, that the vibrating particle may, in its to-and-fro motion, traverse a longer or shorter path; in the second place, it may traverse this path a greater or less number of times in each second, that is, its rate of vibration may differ; in the third place, while traversing its path it may move according to different laws of acceleration or retardation of its velocity: for example, its acceleration during a part of its course may be, andin some cases is constant, or the rate of acceleration may constantly change, and the law of its change may vary in different ways. To the changes in motion thus caused, what I have called the peculiar character of the vibration is due. If we consider these three kinds of variation, in their effect upon the senses, we find that variations in the extent of the path or amplitude of vibration of the particle determine, other things being the same, the loudness of the sound; the variations in the frequency of vibration determine the pitch of the sound; and variations in the character of the vibration determine what is known as the quality, or *timbre* of the sound.

In the statements which I have just made I have spoken of the motion of a single particle; but it is evident, from the mode of transmission of sound, that all of the particles of the air through which the sound is conveyed partake of the various characteristics of vibration which I have discussed.

I have used the term "quality or *timbre*"; quality is that peculiarity of a sound by which, independently of its pitch or loudness, we are enabled to determine the instrument by which the sound is produced; thus, for example, the note of a violin differs from the note of a flute in quality, even though the two are the same in pitch and loudness.

It is well known to scientific men that these differences in quality, which, as I have said, are due to differences in the character of the motions of the vibrating particle, are produced acoustically by the combination of a number of separate or partial tones, which can be shown to be produced when a particle is in vibration; and which partial tones differ in number, in pitch and in intensity or loudness, in accordance with differences in the character of the motion of the vibrating air particles.

The lowest of these partial tones is called the "fundamental," the other and higher notes "overtones." Hence it is evident that the quality of a sound depends upon the relative pitch, intensity and number of partial tones present. In a very few exceptional cases only the fundamental is present, and what is called a simple sound is produced. In general, the pitch of a note is determined by the fundamental, the overtones determining the quality. These facts, constituting what is known as Helmholtz's Theory of Quality, were first discovered by the physicist whose name the theory bears. The human voice owes its peculiar quality to the presence of great numbers of these partial tones; and very slight changes in the partial tones will produce very considerable changes in the voice.

From what I have said thus far, it will be seen, that in order to reproduce articulate speech, we must be able to reproduce, in the air, vibrations which shall possess all these characteristics of pitch, intensity and quality; and which shall, moreover, possess those same characteristics of pitch, intensity and quality; that is, of rate of vibration, amplitude of vibration, and character of vibration, which are possessed by the vibrating particles which are set in vibration directly by the organs of speech. If we can determine the speed and direction of motion of an air particle at each instant, and hence, also, the extent of its path, we can evidently impress upon it all three of the characteristics that I have mentioned; and hence can produce any desired sound at will.

In Mr. Bell's patent No. 174,465, a method is described by which the motions which are produced in the air at one place, the transmitting station, can be reproduced by an electrical method of intercommunication at the receiving station. By means of his invention he is able, by the use of certain electrical apparatus, to impress upon the particles of air at a distant place, the receiving station, motions substantially identical with those which are immediately impressed by the voice upon the particles of air at the transmitting station.

According to the specification, he effects this result by the use of the transmitter, which takes up from the air at the transmitting station the motions which are impressed upon it by the voice of the speaker, and the vibrating portion of which transmitter moves in substantial accordance with the movements of the air particles themselves. This transmitter, being connected with a line wire joining the two stations between which speech is to be transmitted, is enabled, by its electrical connection with that wire, to produce in it electrical variations which correspond to and are similar in form to the motions of the movable part of the transmitter, and hence to the motions of the air particles which have actuated the movable part of the transmitter. These electrical variations, in their turn, set in motion a movable part of a receiving instrument with which the line wire is connected, and in their turn produce in this movable part of the receiver vibrations corresponding to and similar in form to those electrical vibrations by which they are produced, and hence to the motions of the air particles at the transmitting station. The movable part of the receiving instrument, thus vibrating, impresses upon the air at the receiving station vibrations similar in form and corresponding to its own motions.

The motions thus produced in the air particles at the receiving station are therefore evidently similar in form, and correspondent to the original vibrations impressed upon the air at the transmitting station by the voice of the speaker at that station. This being the case, it is evident, from what I have said, that the sound uttered by the speaker at the transmitting station will be reproduced at the receiving station.

It appears from these facts that Mr. Bell's apparatus consists essentially of a transmitter adapted to take up the vibrations of the air at the transmitting station; a line wire connecting the transmitting with the receiving station, together with a battery or some other form of electrical apparatus, which is capable of furnishing a supply of electricity; which line wire shall serve to transmit the electrical variations produced by the transmitter from one station to the other; and a receiver which, actuated by the electrical variations thus transmitted by the line wire, shall be caused to reproduce the motions of the transmitter and of the air particles by which that transmitter is actuated. It is true that the receiving instrument may not always reproduce the vibrations of the air particles at the transmitting station in every minute detail, but the instrument is a speaking telephone only so far as it is adapted to reproduce those motions with substantial fidelity; and its practical construction and reproduction must be such that these vibrations shall be substantially reproduced.

It is evident that when the transmitter is in operation, variations in the electrical current may take place in three ways, — there may be a variation in either the direction of the current; the rate or violence of change of the current; and the frequency of change of the current: and from these three kinds of variations similar variations in the direction, rate and frequency of change of the motion of the movable part of the receiver will result. And hence, from these different electrical variations, differences in the quality, intensity and pitch of the sound produced by the receiving instrument will follow. Therefore, to reproduce articulate speech or any other sound in all its characters of pitch, intensity and quality, it is necessary that the movable portion of the receiving instrument should be constantly under the guidance of, and controlled by, the movable portion of the transmitting instrument; and in case this constant control is not exercised, and in precisely that degree in which it ceases to be exercised, the instrument becomes incapable of transmitting articulate speech.

No form of transmitter which operates by making and breaking an electrical circuit can possibly transmit articulate speech, or any other sound in its different characteristics of pitch, intensity and quality; for the reason that the constant control of which I have spoken is not exercised in such an instrument. With any circuit-breaking instrument the loudness and quality of the sound produced at the receiving station are dependent solely upon the physical construction and action of the receiving instrument itself, and of the battery or other source of electricity by which the transmitter is acted upon. The intensity and quality of the sound produced at the receiving station are therefore, with such an instrument, entirely independent of the intensity and quality of the original sound produced at the transmitting station. It is for this reason that an instrument of this class, such as, for example, the well-known Reis instrument, is incapable of transmitting either intensity or quality; and hence is incapable of transmitting articulate speech.

As will be seen from what I have already said, the Reis transmitter, or any other transmitter which operates by making and breaking the circuit, is capable of transmitting pitch, and pitch only.

There is also another reason which prevents a Reis transmitter, or other circuit-breaking instrument, from transmitting articulated speech; this is the effect of the interruptions of the current, in producing a loud and disagreeable noise in the receiver, which, of itself, would be sufficient to overpower and obliterate those fine shades of variation upon which differences in quality depend.

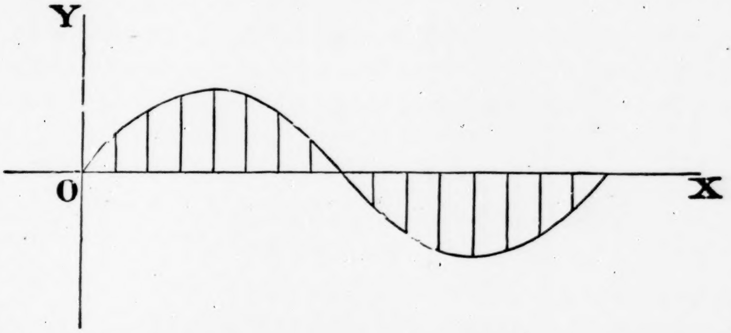
In fact this noise is so marked, that an ordinary battery transmitter can be used as a telephonic call by so operating it as to cause it to actually make and break the electrical circuit. Under these circumstances, the noise which proceeds from the receiving instrument, which, when the transmitter is used in a normal and proper manner, can be heard only by one close to the instrument, is capable of being heard throughout a large room.

Int. 7. You speak of the sound waves, and explain the mode in which they are produced. Do you understand that the actual existence of these sound waves has been demonstrated, or is accepted as a fact by scientific men?

Ans. The existence of such sound waves has been accepted as a fact by scientific men for several hundred years. Within a few years past, they have been visibly shown to exist by a method which demonstrates the existence of alternate condensations and rarefactions to the eye.

Int. 8. Has any method of representing such waves been adopted; and if so, what is it?

Ans. It is customary among physicists to represent the motions of the particles of a sound wave, and also the variations in condensation and rarefaction at different points in a sound wave by a graphical method. I can best illustrate this by reference to a diagram which I produce, to be incorporated in my answer.



The curve in the diagram is what is called a sinusoidal curve, such as corresponds to the sound waves produced by a simple sound, consisting of a single note without overtones. (Such a sound can be produced by a tuning-fork, mounted on a resonant case, and bowed in a manner suitable for this purpose.) O X is divided into a number of equal spaces to represent equal periods of time. The length of these spaces is purely arbitrary. The distances from O to the beginning of any one of these divisions in all its characters of pitch, intensity and quality, it is necessary that the movable portion of the receiving instrument should be constantly under the guidance of, and controlled by, the movable portion of the transmitting instrument; and in case this constant control is not exercised, and in precisely that degree in which it ceases to be exercised, the instrument becomes incapable of transmitting articulate speech.

No form of transmitter which operates by making and breaking an electrical circuit can possibly transmit articulate speech, or any other sound in its different characteristics of pitch, intensity and quality; for the reason that the constant control of which I have spoken is not exercised in such an instrument. With any circuit-breaking instrument the loudness and quality of the sound produced at the receiving station are dependent solely upon the physical construction and action of the receiving instrument itself, and of the battery or other source of electricity by which the transmitter is acted upon. The intensity and quality of the sound produced at the receiving station are therefore, with such an instrument, entirely independent of the intensity and quality of the original sound produced at the transmitting station. It is for this reason that an instrument of this class, such as, for example, the well-known Reis instrument, is incapable of transmitting either intensity or quality; and hence is incapable of transmitting articulate speech.

As will be seen from what I have already said, the Reis transmitter, or any other transmitter which operates by making and breaking the circuit, is capable of transmitting pitch, and pitch only.

There is also another reason which prevents a Reis transmitter, or other circuit-breaking instrument, from transmitting articulated speech; this is the effect of the interruptions of the current, in producing a loud and disagreeable noise in the receiver, which, of itself, would be sufficient to overpower and obliterate those fine shades of variation upon which differences in quality depend.

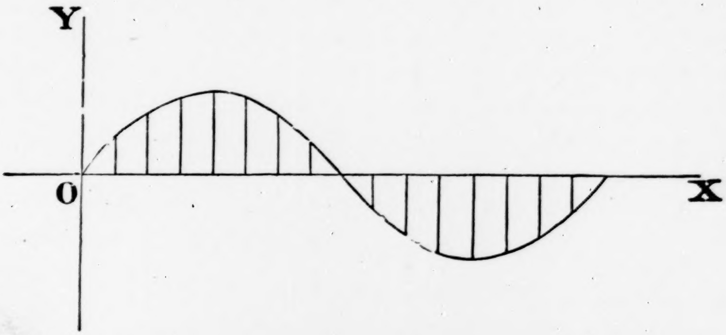
In fact this noise is so marked, that an ordinary battery transmitter can be used as a telephonic call by so operating it as to cause it to actually make and break the electrical circuit. Under these circumstances, the noise which proceeds from the receiving instrument, which, when the transmitter is used in a normal and proper manner, can be heard only by one close to the instrument, is capable of being heard throughout a large room.

Int. 7. You speak of the sound waves, and explain the mode in which they are produced. Do you understand that the actual existence of these sound waves has been demonstrated, or is accepted as a fact by scientific men?

Ans. The existence of such sound waves has been accepted as a fact by scientific men for several hundred years. Within a few years past, they have been visibly shown to exist by a method which demonstrates the existence of alternate condensations and rarefactions to the eye.

Int. 8. Has any method of representing such waves been adopted; and if so, what is it?

Ans. It is customary among physicists to represent the motions of the particles of a sound wave, and also the variations in condensation and rarefaction at different points in a sound wave by a graphical method. I can best illustrate this by reference to a diagram which I produce, to be incorporated in my answer.



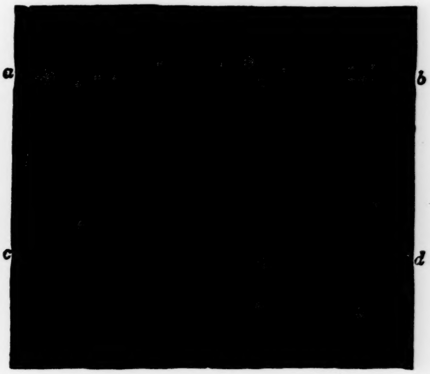
The curve in the diagram is what is called a sinusoidal curve, such as corresponds to the sound waves produced by a simple sound, consisting of a single note without overtones. (Such a sound can be produced by a tuning-fork, mounted on a resonant case, and bowed in a manner suitable for this purpose.) O X is divided into a number of equal spaces to represent equal periods of time. The length of these spaces is purely arbitrary. The distances from O to the beginning of any one of these divisions are called *abscissas*. From each of these points on O X, representing successive intervals of time, lines are drawn parallel to O Y, and proportional in their relative lengths to the distance of the particle from the point of rest at the successive periods of time. In the case of the particle pursuing a simple vibration, these magnitudes will increase to a maximum which will be attained at the instant when it reaches the extremity of its path; they will then diminish, as it comes back to the starting point; and as it passes beyond it, moving in the other direction, they will be indicated by distances measured off below the line O X. Joining then the extremities of the perpendicular lines, we obtain a broken line somewhat resembling a curve; and if we put the perpendicular lines close enough together, the broken line joining their extremities becomes a curve. This curve is determined by the length of two sets of lines or distances, — the *abscissas* measured on O X, and the *ordinates* measured parallel to O Y. In the case stated, the starting point is assumed to be in the middle of the path (*e. g.*, the position of a pendulum when at rest), and the motion is measured in both directions from it; *i. e.*, the curve is on both sides of the line, and part of the ordinates have one direction, part the other. But the point from which the measurements are taken is purely arbitrary; and the line O X, which represents this point, might be placed lower down and tangent to the lowest part of the curve. In that case the curve would not change its character, but the ordinates would all be measured in one direction and on one side of O X. Algebraically expressed, they would all be + quantities, instead of being alternately + and — quantities in the two branches of the curve; only the + quantities would be greater than shown in the diagram. In the case indicated by the diagram we should consider that an increase in the length of the ordinates, in passing from one to the next, signified motion in one direction, and a decrease signified motion in the other direction. In this method of representation one set of lines, measured along O X, corresponds to the period in which the movement is executed, or its frequency; and the other, measured along O Y, to the amplitude or extent and also to the direction of the motion; and these measurements express frequency, amplitude and direction. The same curve will represent the extent of rarefaction and of condensation of the air produced by the movement of the particles, and also, when correctly interpreted, the motion and the varying velocity of the particles.

It is from this habit of graphical expression that a vibration is commonly spoken of among physicists as having "form"; form of vibration is a phrase used to signify the "character" of a vibration, as I have explained it.

It must be remembered that this curve does not represent the path of the moving particle; that always moves to and fro in a straight line. This curve is merely a convenient form of expressing to the eye the character and variation of the motion.

Int. 9. If you can produce from any scientific work a diagram representing the manner in which overtones are combined with a fundamental to give quality to sound different from that due to the fundamental alone, and representing the form given to the curve as the result of all the vibrations, will you do so, stating the source from which you derive it, and explaining, as far as you think necessary, the diagram?

Ans. The following diagram, taken from Mayer on "Sound," p. 153, represents the motion of a particle under the influence of sound waves: —



The curves *a b* represent six sound waves of six simple sounds. When these are sounded together as fundamental and overtones, and with relative intensities corresponding to the amplitude of the curves, as drawn, so as to produce a sound having the quality due to this combination, the vibrational "form," as it is called, of the sound perceived by the ear is represented by the curve at *c d*. The set of vibrations which constitutes one complete vibration is shown twice between *c* and *d*. The entire "form" or character of this curve can be determined and controlled, as already stated, by determining or controlling for each point the length of the abscissa and of the ordinate for that point, or in other words, determining or controlling the elements of time or frequency, amplitude or intensity, and direction; but it is obvious that it will require very many measurements of abscissas and ordinates to determine or control the "form" of each complete set of vibrations.

The curve representing one set of vibrations is about three inches long; and it is apparent, even to a casual observer, that by taking the ordinates as little as one eighth of an inch apart, we should miss the little twists which most strikingly represent to the eye the "quality" or the effect of the overtones in this vibrational form, and which are equally important to the "quality" of the sound as perceived by the ear; and as in the articulate speech of a woman there are twenty-four thousand of these *complete* sets in a minute, it will be obvious that in order to reproduce this vibration the control must be exercised not merely twenty-four thousand times a minute, but really without any interruption or cessation whatever.

Int. 10. If observations have been made upon the curves produced by spoken words, and you can produce a diagram representing the results of such observations, will you do so, giving the authority from which they are made?

Ans. The minute changes which took place during articulation are well shown in a series of curves made by Prof. E. W. Blake, Jr., of Brown University, and described in "Silliman's Journal" for July, 1878. These curves were produced by reflecting a ray of light from a mirror, so attached to the plate of a speaking telephone that the vibrations of this plate were communicated to the mirror. The reflected ray is caused to act photographically upon a sensitized plate of glass, the mirror at the same time being caused

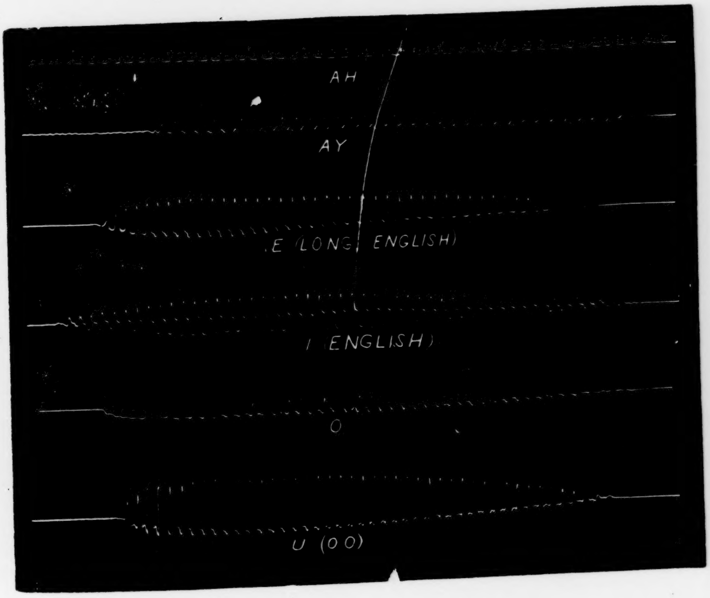
DO
YOU
DO



AH
AY
E (LONG ENGLISH)
I (ENGLISH)
O
U (OO)

to vibrate by the action of the voice upon the telephone plate. On rapidly moving the plate of glass in a direction at right angles to that in which the reflected ray was caused to vibrate by the vibrations of the mirror, a photographed representation of the complex vibrations of the mirror was produced. In Prof. Blake's figures the vibrations characteristic of different vowels, and the rapidly changing vibrations produced in the case of a spoken sentence, are very beautifully shown. According to the statement made by Prof. Blake in the article referred to, the vibrations are magnified in the accompanying cuts one hundred and twelve times. Notwithstanding the accuracy of Prof. Blake's drawings, the mere thickness of the lines in the wood-cut is sufficient to obliterate many of the more delicate variations in those vibrations which characterize articulate speech.

Int. 11. Referring again to the first Bell patent (No. 174,465) to which your attention has been called, will you state what the moving parts are which you have referred to as being put in motion by sound waves or by variations of current produced by sound waves?

Ans. In Fig. 7 the transmitter possesses a movable armature, *c*, one end of which is hinged, while the other is so attached to a membrane at *a* that when this membrane is set in vibration by the utterance of a sound into the cone A, the armature shall be caused to take up the vibrations of the membrane. By the vibration of this armature, as it approaches nearer to or recedes from the pole of the electro-magnet *b*, in accordance with the well-known laws of magneto-electric induction, electrical undulations or waves are produced in and transmitted by the line wire *e*. The receiving instrument which is in electrical connection with the line wire possesses an electro-magnet, *f*, whose magnetic strength varies in accordance with the electrical variations produced in the line wire, in the manner described. In front of this electro-magnet of the receiver and opposite its pole is a vibratory armature of inductive metal hinged at *k* and connected at *i* with a membrane stretched over the larger end of the cone L, so that variations in the magnetic strength of the electro-magnet *f*, produced by electrical variations in the line wire *e*, produce vibrations in the armature *h*, and consequently in the attached membrane, so that this attached membrane vibrates in correspondence with the motions of the membrane of the transmitting instrument, and therefore in correspondence with the vibrations of a voice by which the membrane of the transmitter is actuated. I should have said that the vibrating armatures of both the transmitting and receiving instruments are of iron or other inductive metal; and I would also call attention to the fact that the hinged end of each of these vibratory armatures is in magnetic connection with that pole of the electro-magnet which is farthest from the vibrating part of the armature itself; this mode of connection serving to increase to a certain degree the magnetic strength of the apparatus.

Int. 12. Will you explain a little more in detail the function of the battery represented in Fig. 7 of the Bell patent of which you have been speaking, and the manner in which the undulations in the current are produced in the apparatus represented in that figure; and in what way the undulatory current acts in the receiving instrument to produce the proper results?

Ans. The magnets *b* and *f* in Fig. 7 are electro-magnets having soft iron cores, which cores are magnetic only when a current of electricity is passing through the coils surrounding them. The object of the battery shown in Fig. 7 is simply to produce this current, which shall cause the cores to be kept magnetized. The armature *c* of the transmitter, which is of iron or other inductive metal, will, as it moves to and fro, alternately increase and diminish the magnetic strength of the magnet *b*. These variations of magnetic strength will correspond to the various changes in motion of the vibrating armature. In accordance with the well-known laws of magneto-induction, as discovered by Faraday, every change in the magnetic strength of the core of the electric magnet *b* will produce corresponding changes in the current of electricity which passes through the line wire *e*. These variations in the strength of the current will cause corresponding variations in the magnetic strength of the electro-magnet *f*, and these variations in the strength of the magnet will act immediately upon the vibratory armature at *h*. An increase of strength in the magnet *f* will cause the armature to approach to the magnet, while diminution of magnetic strength will allow the armature, under the influence of the tension of the membrane to which it is attached, to recede farther from the pole *f*. Hence, under the influence of the varying magnetic strength of *f*, the vibratory armature at *h* will execute vibrations corresponding to these changes in magnetic strength, and therefore corresponding to the changes in the electric current in the line wire *e*, to the changes in the magnetic strength of the magnet *b*, and therefore corresponding to the variations in the motion of the vibratory armature at *c*, when moved by the vibrations of the membrane with which it is in contact. The membrane of the receiving instrument at *i* will therefore vibrate in correspondence with the membrane *a* of the transmitting instrument.

Int. 13. Do you find any method suggested in the patent as an alternative one to that you have described for producing the variations or undulations in the current between the transmitter and receiver; if so, will you quote from the specification the language which refers to such other mode?

Ans. It was well known to electricians, long before the date of Mr. Bell's first patent, that the strength of electrical current can be varied, either by increasing its electro-motive force, or by diminishing the resistance of the circuit, in accordance with the well-known law of Ohm, $\text{Current} = \frac{\text{Electromotive force}}{\text{Resistance.}}$

In the apparatus which I have described, Mr. Bell explains a method of producing these electrical undulations by varying the electro-motive force of the current. He also clearly recognizes the possibility of producing such undulations by varying the resistance of the circuit. In his specification, No. 174,465, I find the following: —

> "Electrical undulations may also be caused by alternately increasing and diminishing the resistance of the circuit. . . . The internal resistance of a battery is diminished by bringing the voltaic elements nearer together, and increased by placing them farther apart. The reciprocal vibration of the elements of a battery, therefore, occasions an undulatory action in the voltaic current. The external resistance may also be varied. For instance, let mercury or some other liquid form part of a voltaic circuit; then the more deeply the conducting wire is immersed in the mercury or other liquid, the less resistance does the liquid offer to the passage of the current. Hence the vibration of the conducting wire in mercury or other liquid included in the circuit, occasions undulations in the current. The vertical vibrations of the elements of a battery in the liquid in which they are

immersed, produce an undulatory action in the current, by alternately increasing and diminishing the power of the battery."

Int. 14. If electricians have been in the habit of stating the law to which you have referred in algebraic terms, will you give the form of expression which has been used, explaining the symbols; and state how long that law has been known, and whether or not it is one which has been found of use in the practical application of electricity?

Ans. The law of Ohm is usually expressed by a formula $C = \frac{E}{R}$, in which C is the strength of the current, E, the electro-motive force, that is the force producing the current; and R, the total resistance of the circuit. Ohm's law was, if I recollect rightly, first stated by him about the year 1830. For the last thirty years its importance has been fully recognized by physicists, and it has been applied by constructors of electrical apparatus in determining the dimensions and arrangement of the different parts of such apparatus.

Int. 15. State whether or not, in your judgment, the substitution of one of these ways of varying the current for the other, changes substantially the character of the described apparatus as an apparatus for transmitting sounds; or changes substantially the method by which sounds are transmitted or reproduced.

[*Objected to by counsel for defendants as incompetent, on the ground that the question involves, in part, a question of law and a legal construction of the patent of Bell.*]

Ans. Speaking as a scientific man, I should say that it does not.

Int. 16. If you have examined the two instruments which have been produced in evidence, marked respectively Exhibits "Klemm Battery Transmitter" and "Tisdel Magneto Telephone," and find them adapted to be used for any purpose when connected in electrical circuit with a battery, state what you find their purpose to be.

Ans. I find that the instruments referred to are, from their construction and method of operation, adapted, when suitably connected with a battery, to transmit articulate speech.

Int. 17. State whether so not, in your judgment, when so connected and used for that purpose, they constitute an apparatus substantially like that described in the Bell patent of which you have been speaking, and referred to in the fifth claim, and which will operate in transmitting sounds by substantially the same method; and whether or not, in your judgment, they embody, when so used, the invention described in said patent and referred to in said claim?

[*Same objection as to Int.* 15.]

Ans. The apparatus to which I have referred in my last answer, Exhibits "Klemm Battery Transmitter" and "Tisdel Magneto Telephone," when connected and so operated as to transmit articulate speech, use the method invented by Mr. Bell, and described in his specification No. 174,465, for transmitting vocal or other sounds telegraphically, by causing electrical undulations similar in form to the vibrations of the air accompanying such sound. The instruments in question most certainly embody the invention which Mr. Bell describes in his specification referred to; and when used in the transmission of articulate speech, constitute an apparatus which is substantially that described by Prof. Bell.

Int. 18. Will you compare these instruments, when so connected and used, with Mr. Bell's apparatus to which you have referred, pointing out the functions and mode of operation of the several parts; and if you find that these instruments differ specifically from the Bell apparatus, explain the nature of the differences, and give your judgment as to their affecting the substantial likeness of this apparatus to the Bell apparatus, and its method of operation.

Ans. In Mr. Bell's patent No. 174,465 I find a transmitting instrument, a receiving instrument, a line wire connecting these and a battery or other source of electricity. In the apparatus described the transmitter possesses a movable part which is capable of being set in vibration by the agency of the voice. This movable part is so arranged that it shall cause electrical variations in the current traversing the line wire. The receiver is so arranged that the variations of current referred to shall communicate motion to a movable part, which shall in its turn communicate motion to the air about it. As I have already shown, at some length, the vibrations of this movable portion, when actuated by the sound waves produced by the voice, correspond to these in form; and by their action upon the receiving instrument cause it to vibrate in a similar manner, and hence

PHONE COMPANY,-3

produce corresponding vibrations in the air about the receiver. The function of the transmitter, it is evident, is simply to produce in the line wire electrical undulations similar in form to the vibrations of the air particles through whose agency they are produced. The function of the receiver is simply to translate, so to speak, the electrical undulations produced by the transmitting instrument and conveyed to the receiving instrument by the line wire, into vibrations of the air at the receiving instrument. Mr. Bell indicates that these electrical undulations may be produced either by varying the electromotive force of the current, or by varying the resistance of the circuit.

In the exhibits specified I find a transmitter and a receiver, which, when placed in electrical connection with each other by means of a line wire, and provided with a battery as a source of electricity, are adapted to transmit, and will transmit articulate speech from one station to another.

In the Klemm battery transmitter, I find an instrument which, from its construction, is adapted to produce, and when properly operated by the voice, will produce electrical undulations in the current traversing the circuit, similar in form to the air waves by which these electrical variations are produced.

In the Tisdel receiver, I find an instrument which is adapted to produce vibrations in the air, similar in form to vibrations originally produced in the air, at the transmitting station, by the voice; as I have already explained. The defendants' apparatus, like the Bell apparatus, contains a transmitter, which from its construction is adapted to produce electrical undulations as described, and a receiver which is adapted to retranslate these electrical undulations into vibrations of the air.

The Klemm battery transmitter adopts one of the methods mentioned by Mr. Bell, as suitable for the production of electrical undulations similar in form to the air waves produced by the voice; namely, by varying the resistance of the circuit. The precise method adopted in the Klemm transmitter for varying the resistance of the circuit is different from the particular method referred to by Mr. Bell, inasmuch as it utilizes the property of variation in resistance with variation in pressure possessed by various substances.

In my opinion, however, the adoption of one rather than another particular method of varying the resistance of the circuit does not materially affect the substantial likeness of the apparatus of Mr. Bell and the defendants, or its method of operation.

Int. 19. Will you state whether the fact to which you refer, that the resistance of substances may be varied by pressure, was one known before the date of Mr. Bell's patent, and recognized in the construction of electrical apparatus; and if you can refer to any electrical works of authority, where this fact is referred to, will you do so, and quote the references to the fact?

Ans. It was known long before the date of Mr. Bell's patent, that the resistance of a circuit is varied, without being broken, by variations in the intimacy of contact or amount of pressure between two electrodes in contact, from one to the other of which a current is passing. This fact was noted and recorded by Du Moncel in his book, "Applications de l'Electricité," Vol. II., page 246, edition of 1856, published at Paris in that year. In "Comptes Rendus," for July, 1874, a communication from the same writer described some experiments as to the resistance offered to the current in passing from one electrode to another, in the case where one was a good conductor and the other a poor conductor, and showed that a moderate increase of pressure at the contacts would materially increase the conductivity and thereby the current; and he gave his explanation for this phenomenon.

In Du Moncel, "Applications de l'Electricité," ed. 1856, Vol. I., p. 246, I find the following: —

> "Une chose assez curieuse, et qui paraît être au premier abord en contradiction avec la théorie que l'on s'est faite de l'électricité, c'est que la plus ou moins grande pression exercée entre les pièces de contact des interrupteurs influe considérablement sur l'intensité du courant qui les traverse. Cela tient souvent à ce que les métaux de l'interrupteur ne sont pas toujours dans un état parfait de décapage au point de contact, mais peut-être aussi à une cause physique encore mal appréciée. Ce qui est certain, c'est que, dans les interrupteurs où la pièce mobile de contact est sollicitée par une force extrêmement minime, le courant éprouve souvent des affaiblissements assez notables pour faire manquer la réaction électrique qu'on attend d'eux."

Which I translate as follows: —

"A somewhat curious fact, which at first sight appears to be in

PHONE COMPANY,-3

contradiction to the views ordinarily received as to the action of electricity, is that the greater or less pressure exercised between the contact pieces of interrupters has an important influence upon the strength of the current which traverses them. This often happens because the metal of the interrupter is not perfectly free from rust at the point of contact, but perhaps also because of a physical cause as yet but little appreciated. This is certain, that with interrupters in which a movable contact piece is acted upon by a very slight pressure, the current often sustained such an enfeeblement as to cause a failure in the electrical action which was expected."

The same writer describes in "Comptes Rendus" for July 6, 1874, a series of experiments in which he measured the current in a circuit, part of which consisted of a platinum electrode and a piece of wood, more or less damp, kept in constant contact, but with varying pressure, and says, page 41, in an article entitled "Récherches sur les transmissions électriques a travers les corps ligneux," as follows: —

"Les expériences que j'avais à faire pour avoir une constatation exacte des effets produits, étaient assez délicates, car une foule de causes étrangères peuvent intervenir, et changer les résultats fournis. Ainsi le dégré de serrage des plaques metalliques de communication avec le bois, son isolement plus ou moins parfait du sol et des murs de l'appartement, où l'on expérimente, la grandeur des surfaces mises en communication avec le circuit métallique, la masse du bois, l'état plus ou moins humide de l'air du cabinet expériences, le contact fortuit des doigts sur les fils de communication avec le galvanometre, et l'état d'isolement de ces fils sont autant de causes qui peuvent modifier les résultats que l'on obtient.

. . . .

6. "Que le dégré de la pression de la plaque de platine contre le bois a telement influé sur l'intensité du courant ainsi transmis, qu' étant de 12 dégrés avec un serrage maximum elle est devenue à zéro quand la plaque était abandonné a son propre poids, et a 5 dégrés seulement avec un faible serrage."

This I translate as follows: —

"The experiments that I have had to make in order to have an exact proof of the effects produced were very delicate, because a number of foreign elements might enter and change the results. Thus *the amount of pressure upon the metallic plates in communication with the wood* is more or less perfect insulation from the earth or the walls of the room, the size of the surfaces put in communication with the metallic circuit, the mass of the wood, the greater or less humidity of the air, the accidental contact of the fingers with the wires leading to the galvanometer, and the condition of the insulation of these wires were causes which might modify the results that would be obtained.

. . . .

"6. That the amount of the pressure of the platinum plate against the wood has so much influence on the strength of the current thus transmitted, that from twelve degrees, with a maximum pressure, it became reduced to zero when the plate was pressed only by its own weight, and to five degrees only with a slight pressure."

In Du Moncel's "Traité de Telegraphie Electrique," Paris, 1864, Part IV., page 559, in speaking of apparatus designed to establish electrical contact, the author says,

"L'expérience montre que plus la pression des contacts est grande, plus est énergique l'intensité du courant qui les traverse," that is, in English, "Experiment shows that the greater the pressure of the contact pieces, the stronger is the current passing through them."

This fact was also constantly acted upon in the practical use of electrical apparatus; care was always taken that contacts should be firm and with considerable pressure, for otherwise the full and desired strength of current was not obtained.

Int. 20. In the Exhibit Klemm Magneto Telephone the magnet, as I understood it, is a permanent magnet and differs somewhat in form from the electro-magnet shown in the Bell receiver. State whether or not these differences affect the substantial likeness of the two instruments in respect to their function and mode of operation, and the work they do in the transmission of sounds.

Ans. They do not, since the function of the battery represented in Fig. 7, of Mr. Bell's specification, is merely to keep the cores of the electro-magnets magnetic. When permanent magnets are employed the permanent magnetism of such magnets is substituted for the magnetization produced by the battery current.

Int. 21. Will you refer to the second Bell patent No. 186,787, which has been produced in evidence, and describe briefly so much of the apparatus therein described as is referred to in the fifth, sixth and eighth claims, pointing out the functions or results which are attributed to the parts of the apparatus referred to in those claims?

Ans. Claim 5 relates to the special form of magnet suited for use in an electric telephone; the coil being placed about the end or ends of the magnet nearest the plate. The object of thus placing the coil is to render the magnet quicker in its working, that is, more ready to respond with the requisite rapidity to the variations in the strength of the current passing through the coil. A magnet with the coil thus placed responds more quickly by changes in its strength to slight changes in the strength of the current, and hence it is better adapted for use in the speaking telephone than a magnet in which the coil surrounds the whole length of the magnet, and which consequently acts more slowly.

In claim 6 is mentioned the sounding box, which is combined with the telephone. This sounding box has an important influence in screening the plate of the instrument from the effect of extraneous sounds. The thin air space in front of the plate also exercises an important influence.

In claim 8 I find mentioned the combination of a permanent magnet, with coils upon its end or ends, as described, with a plate of iron or other material, capable of inductive action. The use of the plate of iron, in connection with the magnet, as described in a system of electric telephony, furnishes a most excellent method of causing the electrical and magnetic variations of the apparatus to produce corresponding vibrations in the air.

Int. 22. Referring to the defendants' instruments which have been introduced in evidence, will you compare them with the apparatus described in the patent last referred to, and state how far, if at all, you find them to embrace the features or combinations described in the patent and referred to in the claims above specified?

Ans. In the defendants' magneto-telephone, I find a magnet with a coil upon the end nearest the plate, as described in claim 5. This magnet is placed within a sounding box, as described in claim 6. I find, also, a permanent magnet, as described in claim 8. The mouthpieces of both instruments are so arranged as to leave a thin space filled with air in front of the vibrating plate.

Int. 23. Do you find in the defendants' Klemm battery transmitter that the diaphragm is protected from the action of extraneous sound by a box substantially like that described in the Bell patent?

Ans. I do find that it is thus protected.

Int. 24. I find, in the second Bell patent, a statement that the same instrument is used both as a transmitter and a receiver; and I understand that the electrical portion of the apparatus described in Bell's first patent is the same both in the transmitter and receiver. Will you state whether the exhibit marked "Klemm Magneto Telephone" is, when properly connected in line with another instrument of the same kind, capable of being used as a transmitter as well as a receiver?

[*Objected to as immaterial and as not relating to any issue in this case.*]

Ans. It is.

Int. 25. You referred, I believe, to the fact that in the Klemm battery transmitter the reduced space is present, shown in front of the plate in Bell's second patent. State whether or not you also find in that transmitter the reduced orifice which admits the sound waves to the plate directly at its centre.

Ans. I do.

Int. 26. Please to examine the instrument complainants' Exhibit Tisdel Magneto Telephone, and look particularly at the armature tongue there found; and state how it is connected with the magnet; and what kind of effect that magnetic connection between the armature plate and the magnet has upon the condition of the armature plate, and upon the operation of the apparatus.

Ans. In the instrument mentioned the armature tongue is attached to that pole of the magnet opposite the pole which carries the soft iron pole piece and coil. The armature tongue is attached by means of a screw; and on account of the flexibility of the tongue the portions of this nearer its extremity are capable of vibrating when acted upon either by the diaphragm or the magnet.

The effect of the attachment of the armature tongue to the pole of the magnet is to so polarize it that that portion of the tongue which is opposite the pole piece and coil shall be of an opposite polarity to that of the pole piece itself. The effect of this polarization, provided it has any practical effect, would be to cause slightly stronger currents in the coil than would otherwise be produced.

Int. 27. Please to examine the two Bell patents, which you have already referred to, and state whether you do or do not find in either of them a speaking telephone apparatus, in which the armature tongue is polarized by magnetic connection with the uncovered leg

PHONE COMPANY,-3

of the operating magnet, the other end of which carries the operating coil; and, if you do, point out where you find that feature.

Ans. In Mr. Bell's first patent, No. 174,465, Fig. 7 represents an instrument of this kind. The armatures marked *c* and *h* respectively, in that figure, are fastened loosely at one extremity of the magnets *d* and *k*, so that they can vibrate readily, and so that the vibrating tongues shall be opposite the other pole of the corresponding magnet. These armatures are evidently polarized by induction; and, in consequence, tend to produce greater variations of the current in the coils than would be produced if they were not thus polarized.

Int. 28. In your twenty-sixth answer you indicate that part of the Tisdel instrument which is enclosed in the coil, as a soft iron pole piece mounted on one pole of the permanent steel magnet. Please state what effect that arrangement has on the condition of the said soft iron core, and whether or not you find such an arrangement for the same purpose in either of said Bell patents; and if so, point out the figure which shows it.

Ans. The soft iron pole piece, from its position in connection with the permanent magnet, is constantly polarized, without the necessity of connecting the coil with a battery. A magnet made in this way is much quicker in its action; and, owing to this increased sensitiveness, much better fitted for use in a speaking telephone than if the coil covered a greater portion of the magnet.

This construction of a pole piece surrounded by a coil in contact with and continually polarized by a permanent magnet is shown in Fig. 5 of Mr. Bell's second patent No. 186,787.

Int. 29. I observe that the said Tisdel instrument contains an armature tongue which operates upon or is operated by the electromagnet; and also a diaphragm of insignificant inductive capacity, which acts upon the air or is acted upon by sound waves in the air, according as the instrument is used as a receiver or transmitter.

Will you please state what connection the vibrations of the one have upon the vibrations of the other, if any, and how that connection is secured, if it exists?

[*Objected to as leading; assuming a condition and state of facts by counsel; and not interrogative; and assuming the operation of the device without any demonstration.*]

Ans. The armature tongue is so placed in relation to the diaphragm, that a small piece of rubber which is attached to the tongue (being inserted in a hole drilled in the tongue) shall constantly be in contact with the diaphragm. Hence the armature tongue is, in consequence of this attachment, forced to follow the motions of the plate in its vibration, when the instrument is used as a transmitter; and the plate is forced to follow the vibrations of the armature tongue when the instrument is used as a receiver.

In the instrument exhibited, the armature seems to be mounted so that the rubber shall always be in contact with the plate throughout its whole vibration.

[*Adjourned.*]

FEB. 17.

Cross Examination by LEWIS ABRAHAM, Esq., *of Counsel for Defendants as aforesaid.*

Cross-Int. 30. In answer to Int. 3, in your examination in chief, you say you are practically familiar with the construction and use of the various forms of instruments made in accordance with the Bell patents. Please describe the various forms to which you refer.

Ans. I refer to instruments in general in which the "undulatory current" produced through the action of the voice upon the transmitter is used to reproduce this motion in the receiver. As special forms of the instrument constructed and operated in accordance with the claims of Prof. Bell, I would mention, among others, those represented in Fig. 7 of Mr. Bell's first patent, and those represented in the various figures of Mr. Bell's second patent; also the various forms of microphone transmitter as used by Berliner, Edison, Hughes, Blake and others.

Cross-Int. 31. Are the speaking telephones now in general use built in exact accordance with the specifications and claims of patent No. 174,465, without any additions or improvements either of Bell or others?

Ans. There have been various improvements upon the particular form of apparatus shown in Fig. 7 of that patent; and certain modifications in the precise manner of varying the resistance of the circuit, in cases when this one of the two methods mentioned by Mr.

Bell for producing the undulatory current is used; but all of these variations are intended to accomplish more perfectly the result mentioned in claim 5 of said patent, and operate in the manner there set forth.

[*Answer objected to as not responsive, and the question is repeated.*]

Cross-Int. 32. [*Cross-Int.* 31 *reread.*]

Ans. They are not.

Cross-Int. 33. You state also in your answer to Int. 3, that during the last two years, in the capacity of expert for the American Bell Telephone Company, you have conducted a series of experiments relating to the different branches of the telephone. Please state when your employment commenced, and what duties you have performed as an employé of that company.

Ans. I was first employed by the company in the spring of 1879, in connection with one of the patent cases then in progress; since that time I have been employed by them quite frequently in connection with various cases. I have also frequently been consulted by them with regard to improvements and modifications in the operation of the telephone.

Cross-Int. 34. Are you generally retained as expert for the American Bell Telephone Company?

Ans. They have frequently called upon me when issues have arisen involving the discussion of scientific facts. As I know nothing about the legal operations of the company beyond those specific cases in which I have been asked to testify, I can give no more definite reply than what I have already indicated.

Cross-Int. 35. In whose behalf and at whose request have you testified as a witness in the cases of the courts of the United States, or in cases in the United States Patent Office, upon the principles of inventions embraced in patents or apparatus relating to what is known as the telephonic art?

Ans. At the request of the attorneys of the American Bell Telephone Company, and in behalf of that company.

Cross-Int. 36. Please name, as nearly as you can recollect, the several cases in which you have testified on behalf of that company, either in the courts or before the Patent Office.

Ans. I have testified in connection with the Dowd case, in 1879; and with cases involving the alleged inventions of Messrs. Chinnock, Eaton, and others; I have also given affidavits in connection with the People's Telephone Company, Messrs. Pearce and Jones, and a number of others. The only interference controversies I have testified in relation to, in the Patent Office, relate to certain improvements embodied in the instrument known as the Blake transmitter.

Cross-Int. 37. Referring to claim 5, in patent No. 174,465, do you understand that the electric undulations therein claimed are similar in form, and pass over the line wire similar in form from end to end of said wire, to the form of the sound waves that set the transmitter in motion?

Ans. I do.

Cross-Int. 38. Please explain what you denominate as "continuous voltaic current." Does such a current flow as a continuously uninterrupted flash along the wire without any reference to what distance there is between the *termini*, without any aberration, undulation, pulsation or sinuosity?

Ans. By a "continuous voltaic current," I understand such a current as flows through a conducting wire connecting the two poles of an ordinary galvanic battery. On making or breaking, or in any way electrically altering the battery, conducting wire, or any part of the circuit, electrical changes are of course produced whose nature and the rapidity of whose propagation depend, among other things, on the electrical condition, size, length, etc., of the conducting wire. But when a steady condition of flow has been reached, this flow will continue unchanged so long as the conditions of the circuit remain unchanged. Such a current would be a continuous current.

Cross-Int. 39. In your last answer you speak relatively of the length of the circuit wire. Please approximate the maximum length over which you say a continuous current can practically pass, without any aberration or change.

Ans. Under the conditions supposed, of freedom from disturbing influences, acting to produce an electric change in the circuit, I do not see any limit to the length of the wire.

Cross-Int. 40. In practice, are not all circuit wires affected by atmospheric or other influences?

PHONE COMPANY,-3

Ans. I suppose that there is always a certain influence from disturbing causes; sometimes it is too slight to be detected; sometimes it is so considerable as to produce great annoyance.

Cross-Int. 41. You have testified very learnedly and at great length, on the law of physics relating to the transmission of ordinary sounds. If I correctly understand you, each sound wave acts on an elastic particle of air, and moves it or expands it forward, which, in turn, acts upon its next adjacent particle, and so on continuously, similarly affecting successive adjacent particles, that in consequence of their *inertia* or normal state of rest, they rebound in a direction contrary to that in which they were first impelled by the force of sound; and that, therefore, there is a constant and successive to-and-fro motion imparted to these chains of connecting air particles.

Please explain, if I am correct; and if not, the particular method in which chains of air particles transmit sound from point to point, and thence to a finality.

Ans. Your supposition is correct, so far as the propagation of the original forward motion of each particle, that is, so far as the production of a condensed wave is concerned. The backward motion of the particles is brought about in the following manner: When the sounding body in the course of its vibration moves backward, its motion tends to produce a partial vacuum, the neighboring particles rush in to fill up this space, producing in their turn a diminished pressure a little farther on, and in this way the backward motion or rarefied wave is propagated.

Cross-Int. 42. Is the transmission between these particles a continuity of repeated physical blows, or an expansion and contraction of the several particles of air or their interstices?

Ans. The modern theory of gases which is universally accepted among scientific men supposes all gaseous pressure to be caused by the perpetual "bombardment" of the walls of the containing vessel by the gaseous molecules. By "bombardment," I mean a series of blows very rapid and forcible, produced at almost infinitesimal intervals by the molecules of the gas as they strike against each other, and the vessel containing them.

Cross-Int. 43. Is the sound wave you allude to, and place in inverted commas, in your answer to Int. 6, a sinuous, curved, bent, or simply a plane and rectilinear motion.

Ans. The particles composing the sound wave move to and fro in straight lines in the direction in which the sound progresses. A graphical representation of this sound wave is a sinuous line constructed as I have explained in my answer to Int. 8.

Cross-Int. 44. In further answer to said interrogatory, you say that all the particles of air through which the sound progresses partake of the various characteristics which you have previously named. What are these characteristics? Does each particle in succession partake of all these characteristics?

Ans. The three characteristics of the motion of the air particle mentioned are stated in my answer to Int. 6, in the sentence beginning, "It is evident in the first place" [page 22 of this printed record]. The variations in the sound produced are pitch, intensity, and quality or *timbre.* Each particle in succession partakes in its motion of the three characteristics mentioned.

Cross-Int. 45. Further on you speak of difference in quality being due to difference in character of the motions. Describe the different character of motions to which you refer. Please explain fully the course, direction and contour of these motions; whether spherical, curvilinear, angular or otherwise.

Ans. The motions of the air particles are always to and fro in the same straight line. Difference in quality depends upon the manner in which the rate, frequency and direction of this to-and-fro motion change. This fact will be more clearly understood by reference to the figure given in my answer to Int. 9. Any one of the series of upper curves represents graphically, as previously described, a simple sound of a certain quality. The lower curve represents graphically the complex sound of a different quality. The curves in question are simply graphical or geometrical statements of the algebraic equation which represents the more or less complex motion of the vibrating air particle As I have already said, the motion of the particle itself is always a rectilinear to-and-fro motion.

Cross-Int. 46. In what manner have you demonstrated that the receiving instrument in a telephone moves in exact unison with the

PHONE COMPANY,-3

movements of the several particles of air that have been set in motion at the starting point?

Ans. The only practical demonstration that I know of this perfect correspondence between the motions of the two, lies in the fact that the receiver is practically able to reproduce the various characteristics of the voice itself.

Cross-Int. 47. Are not the diaphragms of the transmitting and receiving instruments, as described in the Bell patents, at right angles, or nearly so, to the line wire?

Ans. In Fig. 7 of the first patent, the diaphragms are substantially at right angles to the line wire. In the diagrams on sheet 2 of the second patent, the diaphragms are parallel to the general direction of the line wire.

Cross-Int. 48. Do I understand you to say that no form of transmitter which operates by making and breaking an electric current, can possibly transmit articulate speech; and that any transmitter which operates by making and breaking an electric circuit is capable of transmitting pitch, and pitch only?

Ans. That is my statement.

Cross-Int. 49. You have testified to the receiving instruments, as described in the Bell patents, vibrating or moving in correspondence with the sound motions propelled or carried over a line of wire; and you have particularly referred to a membrane stretched over the larger end of the cone L. Please state the thickness of this membrane, and at what degree of thickness would it cease to give responsive vibrations.

Ans. I have used membranes as thin as goldbeater's skin; and in some auxiliary experiments I have used a thin soap film, not more than from $\frac{1}{300000}$ to $\frac{1}{500000}$ of an inch thick. Of course this last was not directly in a telephone. The thickest membrane I have ever used was heavy sheepskin. I do not know at what limit of thickness the membrane would cease to respond to sounds of ordinary intensity.

Cross-Int. 50. At what degree of thickness would the membrane, or what is known as the diaphragm, in a transmitting telephone, fail to convey forward on a line wire sound waves or sound impulses?

Ans. Prof. Bell has used heavy iron boiler plate as a diaphragm, and found it sufficiently responsive to transmit the voice. I know of no experiments in which diaphragms thicker than this have been used.

Cross-Int. 51. Do you know of any speaking telephones in common use, built in exact accordance with the specification and claims of patent No. 186,787, without any additions or improvements either by Prof. Bell or others?

Ans. The box telephone, which I think is still occasionally used, is built in accordance with that patent. The only alteration is that the speaking tube, marked E in the figures, is greatly reduced in length. I mean to indicate by this answer, simply that I do not know that the box telephone is entirely disused; although various improvements have caused the original form to be superseded.

Cross-Int. 52. Do not the telephones placed upon the market by the American Bell Telephone Company, and the Metropolitan Telephone and Telegraph Company, consist of and combine several other improvements and inventions besides those of Prof. Bell?

Ans. They do.

Direct Examination resumed.

Int. 53. Please to look at the instrument now shown you, and tell me whether it is or is not the instrument commonly known as the "Bell hand magneto-telephone"; whether it is or is not the form of magneto-telephone commonly put out by the American Bell Telephone Company, except that this particular instrument has been cut open to show its interior.

Ans. It is.

Int. 54. Will you state about how long, so far as your knowledge extends, hand telephones of this particular form, style and construction have been put out for general commercial use by Mr. Bell and his licensees? I mean to include in this question instruments with wooden handles as well as hard rubber handles, if you have ever known of any such distinction in material.

Ans. My impression is that I first knew of their use either late in 1877 or early in 1878.

Int. 55. Please state whether any patented invention relating to telephones or improvements in telephone is embodied in

EPHONE COMPANY,-3

that instrument, other than those set forth in the two Bell patents (No. 174,465 and No. 186,787), the dates of which are stamped on the face of it; and if you know of any other such patents, please name them.

Ans. I do not find in the instrument exhibited any patented improvements beyond those mentioned.

[*The instrument referred to is put in evidence and marked " Complainants' Exhibit Bell Hand Magneto-Telephone."*]

CHAS. R. CROSS.

Attest: CHAS. H. SWAN, *Examiner.*

Counsel for defendants calls upon counsel for complainants for copies of the agreements dated March 20, 1879, and May 8, 1880, referred to in the assignment of the Bell Telephone Company, dated June 2, 1880, and now in evidence as an exhibit; and requests that the same be filed in evidence.

Complainants put in evidence Office copy of patent No. 235,635, dated Dec. 21, 1880, issued to Frank A. Klemm, assignor, by mesne assignments, to the People's Telephone Company, of New York; application filed Nov. 18, 1879.

Also Office copy of patent No. 227,861, dated May 18, 1880, issued to Abner G. Tisdel, assignor to Frank A. Klemm, Ernest Marx, Simon Wolf and Moritz Loth; application filed May 18, 1880.

Also certified copy Patent Office Digest of assignments, agreements, etc., up to Dec. 18, 1880, under or relating to Letters Patent granted to, or inventions of, Daniel Drawbaugh, Frank A. Klemm and Abner G. Tisdel, relating to telephones.

Also certified copies either already filed or herewith filed in this cause of the following:

Agreement Klemm *et al.*, March 6, 1880.

Agreement Klemm *et al.*, March 8, 1880.

Deed Klemm *et al.*, to The People's Telephone Company, dated Sept. 4, 1880.

Deed Mary S. Marx *et al.*, to People's Telephone Company, dated Oct. 11, 1880.

Deed Drawbaugh to Klemm *et al.*, dated July 21, 1880.

Articles of association of The People's Telephone Company, dated Aug. 30, 1880, filed in the office of the clerk of the city and county of New York.

Counsel for defendants gives notice that he will hereafter call upon counsel for complainants for certain documents and agreements referred to in said defendants' answer in this cause, especially those referred to in paragraph 8 in said answer.

The complainants offer to call Edward L. Bradley.

Whereupon it is admitted and agreed by the respondents that said Bradley would testify as he has already testified in the annexed affidavit heretofore filed in this cause; it is also admitted by the complainants that the interviews with Klemm, Marx, and others were had at the express request of the complainants, in whose employ he was at the time, and thereupon cross-examination is waived, and it is agreed that said affidavit, with the foregoing admissions by the complainants, shall stand as the testimony of the said Bradley, subject to all legal objections to its relevancy and effect.

Whereupon the complainants rest their case.

LEWIS ABRAHAM,
for Respondents.
J. J. STORROW,
for Complainants.

AFFIDAVIT OF EDWARD L. BRADLEY.

CITY AND COUNTY OF NEW YORK, ss.

I, Edward L. Bradley, on oath depose and say: —

My name is Edward L. Bradley, age forty-two, residence Jersey City, New Jersey. I am familiar with electric speaking telephones. I produce herewith as part of this affidavit, a magneto telephone, which I have marked "Complainants' Exhibit Tisdel Magneto Telephone, E. L. Bradley." I also produce herewith, as part of this affidavit, a battery transmitting telephone, which I have marked "Complainants' Exhibit Klemm Battery Telephone, E. L. Brad-

EPHONE COMPANY,-3

ley." On or about June 11, 1880, I purchased of Frank A. Klemm, personally, at his residence, No. 234 West 4th Street, New York, a pair of magneto telephones, of which said Exhibit Tisdel Telephone is one. On that occasion Mr. Klemm told me that he and those associated with him intended to make, and put out for use by the public generally, electric speaking telephones, and to establish by themselves and those whom they would supply with telephones, telephonic exchanges; that he was making said telephones at his said premises; that he was endeavoring to perfect a battery-transmitting telephone, to be also sold and put out in the same way. I annex hereto a copy of the bill for said magneto telephones, and will produce the original at the hearing of the case for which this affidavit is taken. On July 31, 1880, I also purchased of said Klemm, at his said residence, the said Exhibit Klemm Battery Telephone. I annex a copy of the bill for said instrument, and will produce the original at the hearing. He told me then that this was the kind that he and his associates intended to put out. That he expected to supply such telephones for use as electric speaking telephones in Harlem and elsewhere, in New York City. That such telephones, both battery and magneto, furnished by him and his associates, were in use in New York City and at Harlem, and that they were arranging to sell them to be used in other parts of the United States. That a line equipped with said telephones, furnished by him, could be found at the place of Mr. Groesman, No. 211 Canal Street, New York City. I went to said Groesman's place, No. 211 Canal Street, and there found one station of a telephone line, and talked over it. On Sept. 11, 1880, I again saw Mr. Klemm at his said residence. He told me that a company got up for the purpose was about to manufacture and sell electric speaking telephones like those I had purchased of him; that he was interested in said company; that Mr. Richard McCormick, of New York, was its president, Mr. Loth, of Cincinnati, was treasurer, and that Mr. Marx, of New York, was its manager; that an executive office for it was being fitted up at No. 4 East 14th Street, New York; that as soon as arrangements could be completed, they should endeavor to establish exchanges and sell telephones. I understood from him that they had applied for patents on some alleged inventions of Drawbaugh. The building No. 4

East 14th Street, New York, has at the street door a sign, "People's Telephone Co." Up one flight of stairs there is an office with the same name on the door. About the middle of September, 1880, I called at that office and found Mr. Marcus Marx there. In conversation he told me that The People's Telephone Co. had begun to furnish telephones and were putting in a few, but he refused to tell me where. He handed me a business card, which is as follows: "The People's Telephone Co. Marcus Marx, manager, New York. Office, 4 East 14th Street." I have the original ready to be produced. I asked him to let me see one of the telephones they were putting in and he said he would do so later. I called on him again on Sept. 25, 1880, at the same office. He declined to show me any telephones, or to tell me where he or his company had put them up, or to give me any information about the subject, stating as a reason that he knew I was employed by the Bell Telephone Company.

E. L. BRADLEY.

Sworn to before me this twelfth day of October, 1880.

AMERICAN BELL TELEPHO

EPHONE COMPANY,-3

UNITED STATES PATENT OFFICE.

ALEXANDER GRAHAM BELL, OF SALEM, MASSACHUSETTS.

IMPROVEMENT IN TELEGRAPHY.

Specification forming part of Letters Patent No. 174,465, dated March 7, 1876; application filed Febuary 14, 1876.

To all whom it may concern:

Be it known that I, ALEXANDER GRAHAM BELL, of Salem, Massachusetts, have invented certain new and useful Improvements in Telegraphy, of which the following is a specification: —

In Letters Patent granted to me April 6, 1875, No. 161,739, I have described a method of, and apparatus, for transmitting two or more telegraphic signals simultaneously along a single wire by the employment of transmitting instruments, each of which occasions a succession of electrical impulses differing in rate from the others; and of receiving instruments, each tuned to a pitch at which it will be put in vibration to produce its fundamental note by one only of the transmitting instruments; and of vibratory circuit-breakers operating to convert the vibratory movement of the receiving instrument into a permanent make or break (as the case may be) of a local circuit, in which is placed a Morse sounder, register, or other telegraphic apparatus. I have also therein described a form of autograph-telegraph based upon the action of the above-mentioned instruments.

In illustration of my method of multiple telegraphy I have shown in the patent aforesaid, as one form of transmitting instrument, an electro-magnet having a steel-spring armature, which is kept in vibration by the action of a local battery. This armature in vibrating makes and breaks the main circuit, producing an intermittent current upon the line-wire. I have found, however, that upon this plan the limit to the number of signals that can be sent simultaneously over the same wire is very speedily reached; for, when a number of transmitting instruments, having different rates of vibration, are simultaneously making and breaking the same circuit, the effect upon the main line is practically equivalent to one continuous current.

In a pending application for Letters Patent, filed in the United States Patent Office Feburary 25, 1875, I have described two ways of producing the intermittent current — the one by actual make and break of contact, the other by alternately increasing and diminishing the intensity of the current without actually breaking the circuit. The current produced by the latter method I shall term, for distinction sake, a pulsatory current.

My present invention consists in the employment of a vibratory or undulatory current of electricity in contradistinction to a merely intermittent or pulsatory current, and of a method of, and apparatus for, producing electrical undulations upon the line-wire.

The distinction between an undulatory and a pulsatory current will be understood by considering that electrical pulsations are caused by sudden or instantaneous changes of intensity, and that electrical undulations result from gradual changes of intensity exactly analogous to the changes in the density of air occasioned by simple pendulous vibrations. The electrical movement, like the aerial motion, can be represented by a sinusoidal curve or by the resultant of several sinusoidal curves.

Intermittent or pulsatory and undulatory currents may be of two kinds, accordingly as the successive impulses have all the same polarity or are alternately positive and negative.

The advantages I claim to derive from the use of an undulatory current in place of a merely intermittent one are, first, that a very much larger number of signals can be transmitted simultaneously on the same circuit; second, that a closed circuit and single main battery may be used; third, that communication in both directions is established without the necessity of special induction-coils; fourth, that cable despatches may be transmitted more rapidly than by means of an intermittent current or by the methods at present in use; for, as it is unnecessary to discharge the cable before a new signal can be made, the lagging of cable-signals is prevented; fifth, and that as the circuit is never broken a spark-arrester becomes unnecessary.

It has long been known that when a permanent magnet is caused to approach the pole of an electro-magnet a current of electricity is

PHONE COMPANY,-3

induced in the coils of the latter, and that when it is made to recede a current of opposite polarity to the first appears upon the wire. When, therefore, a permanent magnet is caused to vibrate in front of the pole of an electro-magnet an undulatory current of electricity is induced in the coils of the electro-magnet, the undulations of which correspond, in rapidity of succession, to the vibrations of the magnet, in polarity to the direction of its motion, and in intensity to the amplitude of its vibration.

That the difference between an undulatory and an intermittent current may be more clearly understood I shall describe the condition of the electrical current when the attempt is made to transmit two musical notes simultaneously — first upon the one plan and then upon the other. Let the interval between the two sounds be a major third; then their rates of vibration are in the ratio of 4 to 5. Now, when the intermittent current is used the circuit is made and broken four times by one transmitting instrument in the same time that five makes and breaks are caused by the other. A and B, Figs. 1, 2, and 3, represent the intermittent currents produced, four impulses of B being made in the same time as five impulses of A. *c c c*, &c., show where and for how long time the circuit is made, and *d d d*, &c., indicate the duration of the breaks of the circuit. The line A and B shows the total effect upon the current when the transmitting instruments for A and B are caused simultaneously to make and break the same circuit. The resultant effect depends very much upon the duration of the make relatively to the break. In Fig. 1 the ratio is as 1 to 4; in Fig. 2, as 1 to 2; and in Fig. 3 the makes and breaks are of equal duration. The combined effect, A and B, Fig. 3, is very nearly equivalent to a continuous current.

When many transmitting instruments of different rates of vibration are simultaneously making and breaking the same circuit the current upon the main line becomes for all practical purposes continuous.

Next, consider the effect when an undulatory current is employed. Electrical undulations, induced by the vibration of a body capable of inductive action, can be represented graphically, without error, by the same sinusoidal curve which expresses the vibration of the inducing body itself, and the effect of its vibration upon the air; for, as above stated, the rate of oscillation in the electrical current corresponds to the rate of vibration of the including body — that is, to the pitch of the sound produced. The intensity of the current varies with the amplitude of the vibration — that is, with the loudness of the sound; and the polarity of the current corresponds to the direction of the vibrating body — that is, to the condensations and rarefactions of air produced by the vibration. Hence, the sinusoidal curve A or B, Fig. 4, represents, graphically, the electrical undulations induced in a circuit by the vibration of a body capable of inductive action.

The horizontal line *a d e f*, &c., represents the zero of current. The elevations *b b b*, &c., indicate impulses of positive electricity. The depressions *c c c*, &c., show impulses of negative electricity. The vertical distance *b d* or *c f* of any portion of the curve from the zero-line expresses the intensity of the positive or negative impulse at the part observed, and the horizontal distance *a a* indicates the duration of the electrical oscillation. The vibrations represented by the sinusoidal curves B and A, Fig. 4, are in the ratio aforesaid, of 4 to 5 — that is, four oscillations of B are made in the same time as five oscillations of A.

The combined effect of A and B, when induced simultaneously on the same circuit, is expressed by the curve A+B, Fig. 4, which is the algebraical sum of the sinusoidal curves A and B. This curve A+B also indicates the actual motion of the air when the two musical notes considered are sounded simultaneously. Thus, when electrical undulations of different rates are simultaneously induced in the same circuit, an effect is produced exactly analogous to that occasioned in the air by the vibration of the inducing bodies. Hence, the co-existence upon a telegraphic circuit of electrical vibrations of different pitch is manifested, not by the obliteration of the vibratory character of the current, but by peculiarities in the shapes of the electrical undulations, or, in other words, by peculiarities in the shapes of the curves which represent those undulations.

There are many ways of producing undulatory currents of electricity, dependent for effect upon the vibrations or motions of bodies capable of inductive action. A few of the methods that may be employed I shall here specify. When a wire, through which a continuous current of electricity is passing, is caused to vibrate in the

PHONE COMPANY,-3

neighborhood of another wire, an undulatory current of electricity is induced in the latter. When a cylinder, upon which are arranged bar-magnets, is made to rotate in front of the pole of an electro-magnet, an undulatory current of electricity is induced in the coils of the electro-magnet.

Undulations are caused in a continuous voltaic current by the vibration or motion of bodies capable of inductive action; or by the vibration of the conducting-wire itself in the neighborhood of such bodies. Electrical undulations may also be caused by alternately increasing and diminishing the resistance of the circuit, or by alternately increasing and diminishing the power of the battery. The internal resistance of a battery is diminished by bringing the voltaic elements nearer together, and increased by placing them farther apart. The reciprocal vibration of the elements of a battery, therefore, occasions an undulatory action in the voltaic current. The external resistance may also be varied. For instance, let mercury or some other liquid form part of a voltaic circuit, then the more deeply the conducting-wire is immersed in the mercury or other liquid, the less resistance does the liquid offer to the passage of the current. Hence, the vibration of the conducting-wire in mercury or other liquid included in the circuit occasions undulations in the current. The vertical vibrations of the elements of a battery in the liquid in which they are immersed produces an undulatory action in the current by alternately increasing and diminishing the power of the battery.

In illustration of the method of creating electrical undulations, I shall show and describe one form of apparatus for producing the effect. I prefer to employ for this purpose an electro-magnet, A, Fig. 5, having a coil upon only one of its legs *b*. A steel-spring armature, *c*, is firmly clamped by one extremity to the uncovered leg *d* of the magnet, and its free end is allowed to project above the pole of the covered leg. The armature *c* can be set in vibration in a variety of ways, one of which is by wind, and, in vibrating, it produces a musical note of a certain definite pitch.

When the instrument A is placed in a voltaic circuit, *g b e f g*, the armature *c* becomes magnetic, and the polarity of its free end is opposed to that of the magnet underneath. So long as the armature *c* remains at rest, no effect is produced upon the voltaic current, but the moment it is set in vibration to produce its musical note a powerful inductive action takes place, and the electrical undulations traverse the circuit *g b e f g*. The vibratory current passing through the coil of the electro-magnet *f* causes vibration in its armature *h* when the armature *c h* of the two instruments A I are normally in unison with one another; but the armature *h* is unaffected by the passage of the undulatory current when the pitches of the two instruments are different.

A number of instruments may be placed upon a telegraphic circuit, as in Fig. 6. When the armature of any one of the instruments is set in vibration all the other instruments upon the circuit which are in unison with it respond, but those which have normally a different rate of vibration remain silent. Thus, if A, Fig. 6, is set in vibration, the armatures of A^1 and A^2 will vibrate also, but all the others on the circuit will remain still. So if B^1 is caused to emit its musical note the instruments B B^2 respond. They continue sounding so long as the mechanical vibration of B^1 is continued, but become silent with the cessation of its motion. The duration of the sound may be used to indicate the dot or dash of the Morse alphabet, and thus a telegraphic dispatch may be indicated by alternately interrupting and renewing the sound. When two or more instruments of different pitch are simultaneously caused to vibrate, all the instruments of corresponding pitches upon the circuit are set in vibration, each responding to that one only of the transmitting instruments with which it is in unison. Thus the signals of A, Fig. 6, are repeated by A^1 and A^2, but by no other instrument upon the circuit; the signals of B^2 by B and B^1; and the signals of C^1 by C and C^2 — whether A, B^2, and C^1 are successively or simultaneously caused to vibrate. Hence by these instruments two or more telegraphic signals or messages may be sent simultaneously over the same circuit without interfering with one another.

I desire here to remark that there are many other uses to which these instruments may be put, such as the simultaneous transmission of musical notes, differing in loudness as well as in pitch, and the telegraphic transmission of noises or sounds of any kind.

When the armature *c*, Fig. 5, is set in vibration the armature *h* responds not only in pitch but in loudness. Thus, when *c* vibrates with little amplitude, a very soft musical note proceeds

PHONE COMPANY,-3

from *h*; and when *c* vibrates forcibly the amplitude of the vibration of *h* is considerably increased, and the resulting sound becomes louder. So, if A and B, Fig. 6, are sounded simultaneously, (A loudly and B softly,) the instruments A^1 and A^2 repeat loudly the signals of A, and B^1 and B^2 repeat softly those of B.

One of the ways in which the armature *c*, Fig. 5, may be set in vibration has been stated above to be by wind. Another mode is shown in Fig. 7, whereby motion can be imparted to the armature by the human voice or by means of a musical instrument.

The armature *c*, Fig. 7, is fastened loosely by one extremity to the uncovered leg *d* of the electro-magnet *b*, and its other extremity is attached to the centre of a stretched membrane, *a*. A cone, A, is used to converge sound-vibrations upon the membrane. When a sound is uttered in the cone the membrane *a* is set in vibration, the armature *c* is forced to partake of the motion, and thus electrical undulations are created upon the circuit E *b e f g*. These undulations are similar in form to the air vibrations caused by the sound — that is, they are represented graphically by similar curves. The undulatory current passing through the electro-magnet *f* influences its armature *h* to copy the motion of the armature *c*. A similar sound to that uttered into A is then heard to proceed from L.

In this specification the three words "oscillation," "vibration," and "undulation," are used synonymously, and in contradistinction to the terms "intermittent" and "pulsatory." By the term "body capable of inductive action," I mean a body which, when in motion, produces dynamical electricity. I include in the category of bodies capable of inductive action — brass, copper, and other metals, as well as iron and steel.

Having described my invention, what I claim, and desire to secure by Letters Patent, is as follows:

1. A system of telegraphy in which the receiver is set in vibration by the employment of undulatory currents of electricity, substantially as set forth.

2. The combination, substantially as set forth, of a permanent magnet or other body capable of inductive action, with a closed circuit, so that the vibration of the one shall occasion electrical undulations in the other, or in itself, and this I claim, whether the permanent magnet be set in vibration in the neighborhood of the

conducting-wire forming the circuit, or whether the conducting-wire be set in vibration in the neighborhood of the permanent magnet, or whether the conducting-wire and the permanent magnet both simultaneously be set in vibration in each other's neighborhood.

3. The method of producing undulations in a continuous voltaic current by the vibration or motion of bodies capable of inductive action, or by the vibration or motion of the conducting-wire itself, in the neighborhood of such bodies, as set forth.

4. The method of producing undulations in a continuous voltaic circuit by gradually increasing and diminishing the resistance of the circuit, or by gradually increasing and diminishing the power of the battery, as set forth.

5. The method of, and apparatus for, transmitting vocal or other sounds telegraphically, as herein described, by causing electrical undulations, similar in form to the vibrations of the air accompanying the said vocal or other sounds, substantially as set forth.

In testimony whereof I have hereunto signed my name this twentieth day of January, A. D. 1876.

ALEX. GRAHAM BELL.

ALEXANDER GRAHAM BELL, OF BOSTON, MASSACHUSETTS.

IMPROVEMENT IN ELECTRIC TELEGRAPHY.

Specification forming part of Letters Patent No. 186,787, dated January 30, 1877; application filed January 15, 1877.

To all whom it may concern:

Be it known that I, ALEXANDER GRAHAM BELL, of Boston, Massachusetts, have invented certain new and useful Improvements in Electric Telephony, of which the following is a specification:

In Letters Patent granted to me the 6th day of April, 1875, No. 161,739, and in an application for Letters Patent of the United States now pending, I have described a method of and apparatus for producing musical tones by the action of a rapidly-interrupted electrical current, whereby a number of telegraphic signals can be sent simultaneously along a single circuit.

In another application for Letters Patent now pending in the United States Patent Office I have described a method of and apparatus for inducing an intermittent current of electricity upon a line-wire, whereby musical tones can be produced and a number of telegraphic signals be sent simultaneously over the same circuit, in either or both directions; and in Letters Patent granted to me March 7, 1876, No 174,465, I have shown and described a method of an apparatus for producing musical tones by the action of undulatory currents of electricity, whereby a number of telegraphic signals can be sent simultaneously over the same circuit, in either or in both directions, and a single battery be used for the whole circuit.

In the applications and patents above referred to, signals are transmitted simultaneously along a single wire by the employment of transmitting-instruments, each of which occasions a succession of electrical impulses differing in rate from the others, and are received without confusion by means of receiving-instruments, each tuned to a pitch at which it will be put in vibration to produce its fundamental note by one only of the transmitting-instruments. A separate instrument is therefore employed for every pitch, each instrument being capable of transmitting or receiving but a single note, and thus as many separate instruments are required as there are messages or musical notes to be transmitted.

My invention has for its object, first, the transmission simultaneously of two or more musical notes or telegraphic signals along a single wire in either or both directions, and with a single battery for the whole circuit without the use of as many instruments as there are musical notes or telegraphic signals to be transmitted; second, the electrical transmission by the same means of articulate speech and sound of every kind, whether musical or not; third, the electrical transmission of musical tones, articulate speech, or sounds of every kind, without the necessity of using a voltaic battery.

In my patent No. 174,465, dated March 7, 1876, I have shown as one form of transmitting-instrument a stretched membrane, to which the armature of an electro-magnet is attached, whereby motion can be imparted to the armature by the human voice, or by means of a musical instrument, or by sounds produced in any way.

In accordance with my present invention I substitute for the membrane and armature shown in the transmitting and receiving instruments alluded to above a plate of iron or steel capable of being thrown into vibration by sounds made in its neighborhood.

The nature of my invention and the manner in which the same is or may be carried into effect will be understood by reference to the accompanying drawings, in which —

Figure 1 is a perspective view of one form of my electric telephone. Fig. 2 is a vertical section of the same, and Fig. 3 is a plan view of the apparatus. Fig. 4 is a diagram illustrating the arrangement upon circuit.

Similar letters in the drawings represent corresponding portions of the apparatus.

A in said drawings represents a plate of iron or steel, which is fastened at B and C to the cover or sounding-box D. E represents a speaking-tube, by which sounds may be conveyed to or from the plate A. F is a bar of soft iron. G is a coil of insulated copper wire, placed around the extremity of the end H of the bar F. I is an adjusting-screw, whereby the distance of the end H from the plate A may be regulated.

The electric telephones J, K, L, and M are placed at different stations upon a line, and are arranged upon circuit with a battery, N, as shown in diagram, Fig. 4.

I have shown the apparatus in one of its simplest forms, it being well understood that the same may be varied in arrangement, combination, general construction, and form, as well as material of which the several parts are composed.

The operation and use of this instrument are as follows:

I would premise by saying that this instrument is and may be used both as a transmitter and as a receiver — that is to say, the sender of the message will use an instrument in every particular identical in construction and operation with that employed by the receiver, so that the same instrument can be used alternately as a receiver and a transmitter.

In order to transmit a telegraphic message by means of these instruments, it is only necessary for the operator at a telephone (say J) to make a musical sound in any way in the neighborhood of the plate A — for convenience of operation, through the speaking-tube E — and to let the duration of the sound signify the dot or dash of the Morse alphabet, and for the operator who receives his message (say at M) to listen to his telephone, preferably through the speaking-tube E. When two or more musical signals are being transmitted over the same circuit all the telephones reproduce the signals for all the messages; but as the signals for each message differ in pitch from those for the other messages, it is easy for an operator to fix his attention upon one message and ignore the other.

When a large number of despatches are being simultaneously transmitted it will be advisable for the operator to listen to his telephone through a resonator, which will re-enforce to his ear the signals which he desires to observe. In this way he is enabled to direct his attention to the signals for any given message without

AMERICAN BELL TELEPHO

being distracted or disturbed by the signals for any other messages that may be passing over the line at the time.

The musical signals, if preferred, can be automatically received by means of a resonator, one end of which is closed by a membrane, which vibrates only when the note with which the resonator is in unison is emitted by the receiving-telephone. The vibrations of the membrane may be made to operate a circuit-breaker, which will actuate a Morse sounder or a telegraphic recording or registering apparatus.

One form of vibratory circuit-breaker which may be used for this purpose I have described in Letters Patent No. 178,399, June 6, 1876. Hence by this plan the simultaneous transmission of a number of telegraphic messages over a single circuit in the same or in both directions with a single main battery for the whole circuit and a single telephone at each station is rendered practicable. This is of great advantage in this, that for the conveyance of several messages, or signals, or sounds over a single wire simultaneously, it is no longer necessary to have separate instruments correspondingly tuned for each given sound, which plan requires nice adjustment of the corresponding instruments, while the present improvement admits of a single instrument at each station, or, if for convenience several are employed, they are all alike in construction, and need not be adjusted or tuned to particular pitches.

Whatever sound is made in the neighborhood of any telephone — say at J, Fig. 4 — is echoed in fac-simile by the telephones of all the other stations upon the circuit; hence this plan is also adapted for the use of the transmitting intelligibly the exact sounds of articulate speech. To convey an articulate message it is only necessary for an operator to speak in the neighborhood of his telephone, preferably through the tube E, and for another operator at a distant station upon the same circuit to listen to the telephone at that station. If two persons speak simultaneously in the neighborhood of the same or different telephones, the utterances of the two speakers are reproduced simultaneously by all the other telephones on the same circuit; hence by this plan a number of vocal messages may be transmitted simultaneously on the same circuit, in either or both directions. All the effects noted above may be produced by the

EPHONE COMPANY,-3

same instruments without a battery by rendering the central bar F H permanently magnetic. Another form of telephone for use without a battery is shown in Fig. 5, in which O is a compound permanent magnet, to the poles of which are affixed poll-pieces of soft iron, P Q, surrounded by helices of insulated wire R S.

Fig. 6 illustrates the arrangement upon circuits of similar instruments to that shown in Fig. 5.

In lieu of the plate A in above figures, iron or steel reeds of definite pitch may be placed in front of the electro-magnet O, and, in connection with a series of such instruments of different pitches, an arrangement upon circuit may be employed similar to that shown in my patent No. 174,465, and illustrated in Fig. 6 of Sheet 2 in said patent. The battery, of course, may be omitted.

This invention is not limited to the use of iron or steel, but includes within its scope any material capable of inductive action.

The essential feature of the invention consists in the armature of the receiving-instrument being vibrated by the varying attraction of the electro-magnet so as to vibrate the air in the vicinity thereof in the same manner as the air is vibrated at the other end by the production of the sound. It is, therefore, by no means necessary or essential that the transmitting-instrument should be of the same construction as the receiving-instrument. Any instrument receiving and transmitting the impression of agitated air may be used as the transmitter, although, for convenience and for reciprocal communication, I prefer to use like instruments at either end of an electrical wire. I have heretofore described and exhibited such other means of transmitting sound, as will be seen by reference to the proceedings of the American Academy of Arts and Sciences, Volume XII.

For convenience, I prefer to apply to each instrument a call-bell. This may be arranged so as to ring, first, when the main circuit is opened; second, when the bar F comes into contact with the plate A. The first is done to call attention; the second indicates when it is necessary to readjust the magnet, for it is important that the distance of the magnet from the plate should be as little as possible, without, however, being in contact. I have also found that the electrical undulations produced upon the main line by the vibration of the plate A are intensified by placing the coil G at the end of the bar F nearest the plate A, and not extend it beyond the middle, or thereabout.

Having thus described my invention, what I claim, and desire to secure by Letters Patent, is—

1. The union upon, and by means of, an electric circuit of two or more instruments, constructed for operation substantially as herein shown and described, so that, if motion of any kind or form be produced in any way in the armature of any one of the said instruments, the armatures of all the other instruments upon the same circuit will be moved in like manner and form, and if such motion be produced in the former by sound, like sound will be produced by the motion of the latter.

2. In a system of electric telegraphy or telephony, consisting of transmitting and receiving instruments united upon an electric circuit, the production, in the armature of each receiving-instrument, of any given motion by subjecting said armature to an attraction varying in intensity, however such variation may be produced in the magnet; and hence I claim the production of any given sound or sounds from the armature of the receiving-instrument by subjecting said armature to an attraction varying in intensity, in such manner as to throw the armature into that form of vibration that characterizes the given sound or sounds.

3. The combination, with an electro-magnet, of a plate of iron or steel, or other material capable of inductive action, which can be thrown into vibration by the movement of surrounding air or by the attraction of a magnet.

4. In combination with a plate and electro magnet, as before claimed, the means herein described, or their mechanical equivalents, of adjusting the relative position of the two so that, without touching, they may be set as closely together as possible.

5. The formation, in an electric telephone such as herein shown and described, of a magnet with a coil upon the end or ends of the magnet nearest the plate.

6. The combination, with an electric telephone such as described, of a sounding box, substantially as herein shown and set forth.

7. In combination with an electric telephone, as herein described,

the employment of a speaking or hearing tube for conveying sounds to or from the telephone, substantially as set forth.

8. In a system of electric telephony, the combination of a permanent magnet with a plate of iron or steel, or other material capable of inductive action, with coils upon the end or ends of said magnet nearest the plate, substantially as set forth.

In testimony whereof I have hereunto signed my name this 13th day of January, A. D. 1877.

A. GRAHAM BELL.

AMERICAN BELL TELEPHON

PHONE COMPANY,-3

BELL TO HUBBARD, TRUSTEE. — ASSIGNMENT OF PATENT RIGHT.

Liber R^{21}, p. 399. [Record, page 20.]

To all whom it may concern:

Whereas, Alexander Graham Bell, of Boston, in the county of Suffolk and State of Massachusetts, did obtain three several Letters Patent of the United States, for an improved system of telegraphy, telephony and telephonic apparatus, which Letters Patent bear date respectively, March seventh, A. D. eighteen hundred and seventy-six, and numbered 174,465, June sixth, A. D. eighteen hundred and seventy-six, and numbered 178,399, and January thirtieth, A. D. eighteen hundred and seventy-seven, and numbered 186,787.

And whereas, Gardiner G. Hubbard, of Cambridge, in the county of Middlesex and State of Massachusetts, trustee, is desirous of acquiring an interest therein; now this indenture witnesseth that for a valuable consideration, viz , one dollar and other valuable consideration to me in hand paid, the receipt of which is hereby acknowledged, I have assigned, sold and set over, and by these presents do assign, sell and set over unto the said Gardiner G. Hubbard, trustee, all the right, title and interest I have in the above described invention, as secured to me by Letters Patent, for, to and in the United States and Territories, and in no other place or places. The same to be held and enjoyed by the said Gardiner G. Hubbard, trustee, for his own use and behoof, and for the use and behoof of his legal representatives, to the full end of the term for which said letters were granted, as fully and entirely as the same would have been held and enjoyed by me had this assignment and sale not been made.

In testimony whereof, I have hereunto set my hand and affixed my seal this day of July, in the year of our Lord one thousand eight hundred and seventy-seven.

ALEXANDER GRAHAM BELL. [SEAL]

Sealed and delivered in presence of

CHAS. EUSTIS HUBBARD.

Recorded July 28, 1877.

HUBBARD, TRUSTEE, TO BELL TELEPHONE COMPANY.

ASSIGNMENT OF PATENT RIGHT.

Liber Y^{22}, p. 460. [Record, page 20.]

To all whom it may concern:

Whereas, Alexander Graham Bell, of Salem, Massachusetts, as assignor to himself, Thomas Sanders and Gardiner G. Hubbard, did obtain Letters Patent of the United States, bearing date April 6, 1875, and numbered 161,739, and whereas said Alexander Graham Bell did obtain Letters Patent of the United States, bearing date March 7, 1876, and numbered 174,465, bearing date June 6, 1876, and numbered 178,399, and bearing date Jan. 30, 1877, and numbered 186,787, all of said Letters Patent being for improvements in "Telegraphy, Telephony and Telephonic Apparatus" invented by said Alexander Graham Bell; and whereas all of said Letters Patent have been assigned to Gardiner G. Hubbard, trustee, said letters numbered 161,739, by deed of assignment, delivered July 9, 1877, and recorded in Liber T^{21}, page 448 of Transfers of Patents; and said letters numbered 174,465, 178,399 and 186,787, by deed of assignment, delivered July 9, 1877, and recorded in Liber R^{21}, page 399 of Transfers of Patents; and said Hubbard, trustee, is now the owner of the above-described inventions secured by said Letters Patent; and whereas the Bell Telephone Company, a corporation duly established under the laws of the Commonwealth of Massachusetts, and located at Boston, is desirous of acquiring the ownership of said inventions secured by said Letters Patent.

Now, this indenture witnesseth that I, Gardiner G. Hubbard, trustee, in consideration of one dollar and other valuable consideration to me in hand paid by said Bell Telephone Company, the receipt whereof is hereby acknowledged, have assigned, sold and set over, and by these presents do assign, sell and set over unto the said Bell Telephone Company all my right, title and interest in the above-described inventions and in and to said Letters Patent, each and all of them, the same to be held and enjoyed by the said Bell Telephone Company for its own use and behoof, and for the use and behoof of its legal representatives, to the full end of the term for which said letters were granted, and any extension or reissue there-

PHONE COMPANY,-3

of, as fully and entirely as the same would have been held and enjoyed by me had this assignment and sale not been made.

In testimony whereof, I have hereunto set my hand and seal this twentieth day of July, in the year eighteen hundred and seventy-eight, being thereto duly authorized.

BELL TELEPHONE CO. TO AMERICAN BELL TELEPHONE CO.

Liber I^{25}, p. 282. [Record, page 20.]

Know all men by these presents:

That the Bell Telephone Company, a corporation established under the laws of the Commonwealth of Massachusetts, in consideration of one dollar, to it paid by the American Bell Telephone Company, a corporation established under the laws of said Commonwealth, the receipt whereof is hereby acknowledged, does hereby grant and convey unto said American Bell Telephone Company the exclusive right, under the following patents, to all the territory of the United States except the State of Massachusetts, viz.: Letters Patent No. 174,465, issued March 7, 1876, to Alexander Graham Bell, for an improvement in telegraphy, and Letters Patent No. 186,787, issued January 30, 1877, to said Alexander Graham Bell, for an improvement in electric telegraphy, and in and to the inventions therein described or intended to be described. To have and to hold the same to the said American Bell Telephone Company, its successors and assigns, to their own use and behoof forever. This instrument is made at the request of the National Bell Telephone Company, in pursuance of an agreement between said Bell Telephone Company and said National Bell Telephone Company, dated March 20, 1879, said American Bell Telephone Company being the appointees of said National Bell Telephone Company to receive this conveyance, and in pursuance of an agreement between said National Bell Telephone Company and said American Bell Telephone Company, dated May 8, 1880.

In witness whereof, said Bell Telephone Company has caused its corporate seal to be hereto affixed, and these presents to be signed in its name and behalf, by William H. Forbes, its president, and William R. Driver, its treasurer, thereto duly authorized; this twenty-second day of June, A. D. 1880.

ACT INCORPORATING THE AMERICAN BELL TELEPHONE COMPANY.

[Record, page 20.]

Chapter 117.

COMMONWEALTH OF MASSACHUSETTS.

IN THE YEAR ONE THOUSAND EIGHT HUNDRED AND EIGHTY.

AN ACT

TO INCORPORATE THE AMERICAN BELL TELEPHONE COMPANY.

Be it enacted by the Senate and House of Representatives, in General Court assembled, and by the authority of the same, as follows: —

Section 1. Alexander Graham Bell, William H. Forbes, George Z. Silsbee, Richard S. Fay, Alexander Cochrane, George L. Bradley, Francis Blake, Jr., Thomas Sanders and Charles Eustis Hubbard, and their associates, may associate themselves and organize a corporation according to the provisions of chapter two hundred and twenty-four of the Acts of the year eighteen hundred and seventy, and the Acts in amendment thereof and addition thereto, for the purpose of manufacturing, owning, selling, using and licensing others to use, electric speaking telephones and other apparatus and appliances pertaining to the transmission of intelligence by electricity, and for that purpose constructing and maintaining by itself and its licensees public and private lines and district exchanges, with a capital stock exceeding one million of dollars, and not exceeding ten millions of dollars.

Section 2. For the purposes aforesaid, said Corporation may become a stockholder in or become interested with other corporations hereafter organized for like purposes, or already established for the transaction of telephonic business under its patents and no others; provided, that said Corporation shall not become a stockholder in any other corporation doing business in this State to an amount exceeding thirty per cent of the capital stock of said last named corporation. And it and its licensees may, with this Commonwealth, enjoy the rights given by chapter sixty-four of the

General Statutes and Acts amendatory thereof, and shall be subject to the liabilities therein imposed; but section ten of said chapter shall only apply to their public lines; and the apportionment provided by section five of chapter two hundred and eighty-three of the Acts of the year eighteen hundred and sixty-five and Acts amendatory thereof, shall be made upon the number of telephones in use by it, or under its authority, or with its permission, or under letters patent owned or controlled by it within and without this Commonwealth respectively; and the returns to be made under said Act shall state the facts required for such apportionment in such form as the Tax Commissioner may determine; and it shall be the duty of said Tax Commissioner, or his deputy, to annually examine the books, accounts and papers of said corporation, so far as may be necessary for the verification of said returns.

SECTION 3. When an injury is done to a person or to property by the posts, wires, telephones, or other apparatus of the Corporation, caused by any negligence on the part of itself or its officers, or on the part of any of its agents, servants, employees or operatives, the Corporation shall be responsible in damages to the party injured.

SECTION 4. The franchise or charter of said Corporation shall not be sold or offered for sale, or leased, to any company, or to any person or association of persons, without the consent of the Legislature; and any contract made contrary to the provisions of this Act shall be void. And this charter may be revoked by the Legislature for any cause which they deem sufficient.

SECTION 5. The provisions of the first and second sections of the three hundred and tenth chapter of the Acts of the year eighteen hundred and sixty-eight shall apply to said telephone company and its licensees.

Said Corporation shall be subject to all general laws that now are, or that may be hereafter in force, relating to similar corporations, so far as the same shall not be inconsistent with the provisions of this Act.

SECTION 6. This Act shall take effect upon its passage.

PHONE COMPANY,-3

HOUSE OF REPRESENTATIVES, March 12th, 1880.

Passed to be enacted.

CHAS. J. NOYES,
Speaker.

IN SENATE, March 17th, 1880.

AMERICAN BELL TELEPHON

CERTIFICATE OF INCORPORATION OF THE AMERICAN BELL TELEPHONE COMPANY.

[RECORD, PAGE 20.]

No. 1077.

COMMONWEALTH OF MASSACHUSETTS.

Be it known that whereas W. H. Forbes, George L. Bradley, G. Z. Silsbee, Charles Eustis Hubbard, Francis Blake, W. G. Saltonstall, Richard S. Fay, R. W. Devonshire, Charles Emerson, Thomas B. Bailey, and C. M. Whitcomb have associated themselves with the intention of forming a corporation under the name of the American Bell Telephone Company, for the purpose of manufacturing, owning, selling, using and licensing others to use, electric speaking telephones and other apparatus and appliances pertaining to the transmission of intelligence by electricity, and for that purpose constructing and maintaining by itself and its licensees public and private lines and district exchanges with a capital of seven million three hundred and fifty thousand dollars, and have complied with the provisions of the Statutes of this Commonwealth in such case made and provided, as appears from the certificate of the President, Treasurer and Directors of said corporation, duly approved by the Commissioner of Corporations, and recorded in this office:

Now, therefore, I, Henry B. Peirce, Secretary of the Commonwealth of Massachusetts, do hereby certify that said W. H. Forbes, G. L. Bradley, G. Z. Silsbee, C. E. Hubbard, F. Blake, W. G. Saltonstall, R. S. Fay, R. W. Devonshire, C. Emerson, T. B. Bailey and C. M. Whitcomb, their associates and successors, are legally organized and established as and are hereby made an existing corporation under the name of the American Bell Telephone Company, with the powers, rights and privileges, and subject to the limitations, duties and restrictions, which by law appertain thereto.

[SEAL] Witness my official signature hereunto subscribed, and the seal of the Commonwealth of Massachusetts hereunto affixed this seventeenth day of April, in the year of our Lord one thousand eight hundred and eighty.

(Signed)
HENRY B. PEIRCE,
Secretary of the Commonwealth.

COMMONWEALTH OF MASSACHUSETTS.

SECRETARY'S DEPARTMENT,
BOSTON, December 24, 1880.

I hereby certify, that the foregoing is a true copy of the Certificate of Incorporation of the American Bell Telephone Company, organized under the provisions of chapter two hundred and twenty-four of the Acts of the year eighteen hundred and seventy (and Act 1880, 217), having "the force and effect of a special charter," as appears by the records of this Department.

Witness the seal of the Commonwealth.

[SEAL] HENRY B. PEIRCE,
Secretary of the Commonwealth.

COMMONWEALTH OF MASSACHUSETTS.

SECRETARY'S DEPARTMENT,
BOSTON, December 24, 1880.

EXTRACT FROM SECTION 11 OF CHAPTER 224 OF THE ACTS OF THE YEAR 1870.

"The Secretary of the Commonwealth shall sign the same and cause the seal of the Commonwealth to be thereto affixed, and such certificate shall have the force and effect of a special charter, and be conclusive evidence of the organization and establishment of such corporation. The secretary shall also cause a record of such certificate to be made, and a copy of such record, duly certified, may, with like effect as the original certificate, be given in evidence to prove the organization and establishment of such corporation."

I hereby certify that the foregoing is a true copy of a portion of Section 11 of Chapter 224 of the Acts of 1870; that the said section is in force, and that the certificate of incorporation of which the annexed is a copy, is a certificate issued under and in pursuance of said section of said Act.

Witness the seal of the Commonwealth.

[SEAL] HENRY B. PEIRCE,
Secretary of the Commonwealth.

UNITED STATES PATENT OFFICE.

FRANK A. KLEMM, OF NEW YORK, N. Y., ASSIGNOR, BY MESNE ASSIGNMENTS, TO THE PEOPLE'S TELEPHONE COMPANY, OF SAME PLACE.

TELEPHONE-TRANSMITTER.

SPECIFICATION forming part of Letters Patent No. 235,635, dated December 21, 1880.

Application filed November 18, 1879.

To all whom it may concern:

Be it known that I, FRANK A. KLEMM, of the city, county, and State of New York, have invented a new and useful Improvement in Telephone-Transmitters, of which the following is a specification.

The object of my invention is to simplify the construction and connections of transmitting-instruments for telephone-lines, and to obtain a more perfect operation than heretofore; and the invention consists in a diaphragm suspended upon an arm, or as a spring-tongue, and an adjustable spring-arm carrying the carbon contact-point, combined together. These features will be particularly described with reference to the accompanying drawings, wherein—

Figure 1 is a sectional elevation of the transmitter. Fig. 2 is a back view of the mouth-piece and diaphragm.

Similar letters of reference indicate corresponding parts.

A is the box of the instrument, which may be of any desired form, and is fitted at the top with the mouth-piece *a*. B is the induction-coil. *b* is the diaphragm, attached to the under side of piece *a* by the metal arm *c*. *d* is a spring-arm fixed upon a post, *e*, that is attached to the under side of piece *a*. *f* is the adjusting-screw, sustained in an extension from post *e* and bearing on the spring *d*. *g* is the carbon-holder attached upon the outer end of spring *d*.

The connections to the local circuit with battery are from the arm *c* to a binding-post at the side of the box A, and from the post *e* to the primary of coil B, and from thence to a second binding-post. The secondary of coil B is connected to the main line.

The arm *c*, sustaining the diaphragm *b*, is constructed of spring metal, and tends to press the diaphragm in contact with the piece *a*. The diaphragm is damped by a ring of rubber or other material attached upon its edges, and is fitted at its center with a point of platinum.

The spring-arm *d*, carrying the carbon-holder, tends to separate the contact-points, and its position is regulated by screw *f*.

It will be seen that this construction is very simple. The diaphragm is substantially a spring-tongue, its vibrations being upon its support *c*, and its movement vibrates the arm *d*. The movements of *b* would be naturally more sluggish than the movements of *d*, and the change of resistance is due to that difference, regulated by the pressure given by screw *f*.

It will be observed that, the diaphragm *b* having a platinum point arranged in its center, as shown at *h*, Fig. 1, and connected by a metallic spring-arm, *c*, to the mouth-piece, and said arm having connection in the manner described with the local circuit, the diaphragm becomes in itself one of the electrodes, and that the spring-arm *c* permits the diaphragm to vibrate freely, even though it is in constant contact with the carbon point secured to the end of the spring-electrode *d*.

I disclaim a spring forming or carrying one electrode of the circuit of a telephone and constantly pressing against the other electrode, to maintain the required initial pressure between the electrodes and yield to the movements of the diaphragm.

I also disclaim a yielding weight carried by a spring connected with the movable electrode, to resist the movements of the diaphragm and modify by its inertia the variations of pressure between the electrodes; and I further disclaim the application of a band of rubber or other similar plastic material to the disk of a telephone to cover the edge and lap over upon both faces.

Having thus described my invention, I claim as new and desire to secure by Letters Patent—

1. The diaphragm *b*, connected with the mouth-piece by a spring-arm, *c*, substantially as and for the purpose set forth.

2. In telephone-transmitters, the diaphragm *b*, attached to the mouth-piece by the spring-arm *c*, and the adjustable spring-arm *d*, carrying the carbon-holder, combined and operating substantially as shown and described.

3. In telephone-transmitters, the spring carbon-holder *d* and adjusting-screw, combined with the diaphragm *b*, hung as a spring-tongue, substantially as described and shown.

ABNER G. TISDEL, OF ILION, ASSIGNOR TO FRANK A. KLEMM AND ERNEST MARX, OF NEW YORK, N. Y., SIMON WOLF, OF WASHINGTON, D. C., AND MORITZ LOTH, OF CINCINNATI, OHIO.

MAGNET-TELEPHONE.

SPECIFICATION forming part of Letters Patent No. 227,861, dated May 18, 1880.

Application filed November 14, 1879.

To all whom it may concern:

Be it known that I, ABNER G. TISDEL, of Ilion, in the county of Herkimer and State of New York, have invented a new and useful Improvement in Speaking-Telephones, of which the following is a specification.

My improvements relate to the class of telephones using a permanent magnet and induction-coil, whereby the magnetic vibrations of the poles caused by the induced current and vibrations in magnetic force produce the sound-waves by action upon a diaphragm, or, reversely, the variations in magnetic force and vibration of the magnet are produced by the sound-waves acting on the diaphragm.

My invention consists in the combination and construction of parts, as hereinafter described and claimed, whereby freedom of vibration of the diaphragm of a telephonic transmitter and receiver is controlled so that the effect of the force of the magnetic current may be easily regulated at will.

Figure 1 is a front elevation of the instrument, the mouth-piece being removed. Fig. 2 is a cross-section on the line *x x* of Fig. 1.

Similar letters of reference indicate corresponding parts.

A is a permanent magnet of U form, having one pole surrounded by the induction-coil B, and its other pole terminating in a thin metallic tongue, *a*. The coil B is upon a right-angled extension of the pole which projects contiguous to the tongue *a*, so that both poles of the magnet are within the magnetic field. These parts are fitted in a case, C, having a mouth-piece, *b*, beneath which is clamped the diaphragm *c*, of mica or other non-conducting material.

Upon the tongue *a* is a small block or point, *d*, of metal, rubber, or other material, which is in mechanical contact with diaphragm *c*.

The magnet A extends into a recess of the case B, in which is a spring, *f*, that tends to press the other end of the magnet away from the diaphragm *c*, and in the back of the case a screw, *g*, is fitted, bearing upon the magnet against the pressure of spring *f*, so that by turning screw *g* the pressure of the block *d* upon the diaphragm may be regulated.

The connecting-wires *h h'* from coil B connect with the binding-posts *i i'*, respectively, for connection with the circuit that is to contain a similar instrument.

The instrument in the form shown is adapted for transmitting or receiving.

In operation as a transmitter the vibrations of the diaphragm will cause the vibration of the tongue *a* to and from the other pole of the magnet. Such vibrations being entirely within the magnetic field, the magnetic force and induced current will vary with the extent of vibration. These variations in the induced current act in the receiving-instrument to vary the magnetic force of the induction-coil and the tongue *b* and diaphragm *c* of the receiver will be vibrated in harmony with the transmitter to produce articulate sounds.

I am aware that in telephones a permanent magnet has been used with one pole fitted with a helix and the other pole formed as a vibrating diaphragm. In such instruments, to obtain the required amplitude of vibration, the magnet-bar must be shortened to admit a diaphragm of the size required, while in my instrument the vibrating tongue may be short and the poles of the magnet brought closely together. The tongue, being also protected, may be of the most delicate construction.

Having thus described my invention, I claim as new and desire to secure by Letters Patent—

In speaking-telephones, the spring *f* and adjusting-screw *g*, combined with the magnet A, diaphragm *c*, block *d*, and case C, substantially as and for the purposes set forth.

ABNER G. TISDEL.

EPHONE COMPANY,-3

CERTIFIED COPY DIGEST ASSIGNMENTS, ETC., TO DEC. 18, 1880, RELATING TO TELEPHONE PATENTS AND INVENTIONS OF DRAWBAUGH, KLEMM & TISDEL.

[Record, page 51.]

UNITED STATES PATENT OFFICE.

To all Persons to whom these Presents shall come, Greeting:

This is to certify that the annexed is a true copy from the Digest of this Office of all assignments, Agreements, Licenses, Powers of Attorney, and other instruments of writing found of record up to and including Dec. 18, 1880, under or relating to Letters Patent granted to, or inventions of Daniel Drawbaugh, Frank A. Klemm and Abner G. Tisdel, relating to Telephones.

In Testimony whereof, I, E. M. Marble, Commissioner of Patents, have caused the seal of the Patent Office to be hereunto affixed this twenty-third day of December, in the year of our Lord one thousand eight hundred and eighty, and of the Independence of the United States the one hundred and fifth.

[SEAL] E. M. MARBLE,
Commissioner.

EPHONE COMPANY,-3

CERTIFIED COPY AGREEMENT BETWEEN MARX, KLEMM, WOLF AND LOTH.

[Record, page 51.]

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE.

To all persons to whom these presents shall come, greeting:

This is to certify, that the annexed is a true copy from the records of this Office, of an agreement recorded in Liber H 25, p. 39, and that said annexed copy has been compared by me with the original, and that it is a correct transcript thereof, and of the whole of said original.

In testimony whereof, I, E. M. Marble, Commissioner of Patents, have caused the seal of the Patent Office to be hereunto affixed this twenty-first day of January, in the year of our Lord one thousand eight hundred and eighty-one, and of the Independence of the United States the one hundred and fifth.

[SEAL]

E. M. MARBLE,
Commissioner.

Liber H^{25}, p. 39.

Whereas, Ernest Marx, of the city, county and State of New York, is sole owner of an undivided three tenths part of certain improvements in Speaking Telephones, the invention of Abner G. Tisdel, of Ilion, in the county of Herkimer and State of New York, and of the Letters Patent to be issued therefor; and is also sole owner of an undivided three tenths part of certain improvements in Telephone Repeaters, Telephone Receiver and Transmitters, Induction Coils, and certain improvements in Telephones, the inventions of Frank A. Klemm, of the city, county and State of New York, and in the Letters Patent to be obtained therefor. And whereas Frank A. Klemm, of the city, county and State of New York, is sole owner of a like undivided three tenths part in all of said improvements and inventions, and in the Letters Patent to be issued therefor. And whereas Moritz Loth, of the city of Cincinnati, county of Hamilton and State of Ohio, is sole owner of one undivided one fifth part in all of said improvements and inventions, and in the Letters Patent to be issued therefor. And whereas Simon Wolf, of the city of Washington, in the District of Columbia, is sole owner of one undivided one fifth part in all of said improvements and inventions, and in the Letters Patent to be issued therefor. Now this agreement witnesseth, That the said Ernest Marx, Frank A. Klemm, Moritz Loth and Simon Wolf, each and all mutually covenant and agree, one and all, with each other, that each and all of their interests in said improvements and inventions, and in the Letters Patent to be issued therefor, shall be merged and consolidated as common stock in a corporate body, to be formed and created and incorporated under the general laws either of the State of New York, the State of Ohio, or the general laws of the United States relating to the formation of incorporations in the District of Columbia, or of such other States or Territories as may be found necessary hereafter; and each of the parties to this agreement mutually covenant and agree, one and all, with each other, that they will each and all of them retain intact their respective shares, titles and interests in all of said improvements and inventions, and in the Letters Patent to be issued therefor; and that they, each and all of them, will not sell, transfer or assign their respective titles and interests in and to said improvements and inventions, and in the Letters Patent to be issued therefor, except to said corporation or corporations to be hereafter formed and created in accordance with this agreement; and it is further understood and agreed upon by each and all of the parties hereto, that the gross capital of the corporations to be created and formed in accordance with the stipulations hereinbefore set forth shall be represented by stock to be issued for five millions of dollars ($5,000,000), in shares of one hundred dollars each ($100 each), to be distributed to each of the parties hereto in proportions equal to their respective interests in the improvements, inventions and Letters Patent, as hereinbefore set forth, — that is to say, three tenths ($\frac{3}{10}$ths) to Frank A. Klemm, three tenths ($\frac{3}{10}$ths) to Ernest Marx, one fifth ($\frac{1}{5}$th) to Moritz Loth, and one fifth ($\frac{1}{5}$th) to Simon Wolf, — and that each of said parties is at full liberty to dispose of any or all of said stock so issued to him, in accordance with the rules and laws of said corporation or corporations and not otherwise; and each and all of the parties hereto covenants and agrees to surrender, assign, transfer and set over to said corporation or corporations each and all of their respective titles and interests in said improvements, inventions and Letters Patent hereinbefore mentioned and referred to; and that they will, each and all of them, hereafter make, execute and deliver all such deeds, assignments, and other instruments, undertakings and writings that may be found necessary in the premises for the purpose of carrying out the provisions of this agreement.

In testimony of the whole of which the said Ernest Marx, the said Frank A. Klemm, the said Moritz Loth and the said Simon Wolf, have each of them hereunto set their respective hands and seals, this sixth day of March, 1880.

CERTIFIED COPY OF AGREEMENT BETWEEN MARX, KLEMM, WOLF AND LOTH.

[Record, page 51.]

Liber H^{25}, page 42.

New York March 8th, 1880.

Frank A. Klemm, Earnest Marx, Simon Wolf, and M. Loth, each and all agree one with the other and all others, that they will not either of them without the consent of all the others assign or make any contract to assign any share of stock before said stock is issued, but that a joint contract may be made to dispose of some of the stock to be issued to such party or parties hereafter agreed upon, with the distinct understanding that whatever is realized therefor shall be divided in equal proportions in accordance with their respective interest- viz; 3/10 to Frank A. Klemm, 3/10 to Earnest Marx, 1/5 to Simon Wolf, 1/5 to Morits Loth.

ASSIGNMENT KLEMM ET AL. TO PEOPLE'S TELEPHONE COMPANY.

[Record, page 51.]

DEPARTMENT OF THE INTERIOR.

UNITED STATES PATENT OFFICE.

To all Persons to whom these Presents shall come, Greeting:

This is to certify that the annexed is a true copy from the records of this office of two (2) assignments recorded in the volumes as stated on the margins of each copy, respectively, and that said annexed copies have been compared by me with the originals, and that they are correct transcripts thereof, and of the whole of said originals.

EPHONE COMPANY,-3

In testimony whereof, I, E. M. Marble, Commissioner of Patents, have caused the seal of the Patent Office to be hereunto affixed, this ninth day of November, in the year of our Lord one thousand eight hundred and eighty, and of the Independence of the United States the one hundred and fifth.

E. M. MARBLE,
Commissioner.

[L. S.]

Whereas, Frank A. Klemm, of the city, county and State of New York, Moritz Loth, of the city of Cincinnati, county of Hamilton, and State of Ohio, Ernest Marx, of the city, county and State of New York, and Simon Wolf, of the city of Washington, District of Columbia, are now owners of the following patents, that is to say: No. 227,270, granted to Frank A. Klemm, dated May, 1880; No. 227,546, granted to Frank A. Klemm, dated May 11th, 1880; No. 227,861, granted to Abner G. Tisdel, dated 11th May, 1880, and No. 230,288, granted to Frank A. Klemm, dated July 20th, 1880, which four patents have been duly assigned to us, as will more fully appear by reference to deeds of assignment, now on record in the United States Patent Office.

And whereas we are also owners of certain improvements in telephones, and telephone apparatuses, the inventions of the said Frank A. Klemm, for which applications for patents are now pending in the United States Patent Office, and further are owners of all inventions of the said Frank A. Klemm relating to telephones, and for the patents that may be issued therefor. And whereas we are also owners of the inventions in telephones made by Daniel Drawbaugh, of Eberly's Mills, Cumberland County, in the State of Pennsylvania, for which applications for patents was made on or about the twenty-first day of July, 1880, and which was assigned to us on the first day of July, 1880, as more particularly appears in a certain deed of assignment recorded in the United States Patent Office, in Liber W 25, page 85, in the book of transfers of patents.

And whereas The People's Telephone Company, a corporation formed under the laws of the State of New York, is desirous of acquiring the entire interest in each and all of said inventions and in the patents that may be issued therefor, and in each and all of the patents that have been issued as hereintofore recited, and in each and all of the applications that are pending hereintofore recited and referred to and in the patents that may be issued therefor;

Now, therefore, to all whom it may concern, be it known that for and in consideration of the sum of four million nine hundred and ninety-nine thousand five hundred and fifty dollars ($4,999,550), represented by ninety-nine thousand nine hundred and ninety-one shares (99,991) in the stock of the said The People's Telephone Company, the receipt whereof is hereby acknowledged, we, the said Frank A. Klemm, Moritz Loth, Ernest Marx and Simon Wolf, have sold, assigned and transferred, and by these presents do sell, assign and transfer unto the said The People's Telephone Company, the whole right, title and interest in, and to each and all of the patents granted to the said Abner G. Tisdel, and the said Frank A. Klemm, as hereinbefore recited, and in and to each and all of the inventions of the said Frank A. Klemm, for which applications are now pending in the United States Patent Office, and in and to the inventions of the said Frank A. Klemm, hereintofore referred to, and in and to the inventions of the said Frank A. Klemm, for which applications for patents may be hereinafter made, and in and to all patents that may be granted therefor; and we hereby authorize and request the Commissioners of Patents to issue any and all patents that may be granted to the said Frank A. Klemm for the inventions hereintofore referred to, to the said The People's Telephone Company, as the assignee, our entire right, title and interest in and to the same for the sole use and behoof of The People's Telephone Company and their legal representatives as fully and entirely as the same would have been held and enjoyed by us had this assignment and sale not been made.

And it is further understood and agreed upon that for the consideration hereinbefore mentioned, and the receipt of which is hereby further acknowledged, we, the said Frank A. Klemm, Moritz Loth, Ernest Marx and Simon Wolf, have sold, assigned and transferred, and by these presents do sell, assign and transfer unto the said The People's Telephone Company the full and exclusive right to the inventions of Daniel Drawbaugh, of Eberly's Mills, Cumberland

County, State of Pennsylvania, and in and to the patents that may be granted therefor as fully set forth and described in the application for Letters Patent filed on or about the twenty-first day of July, 1880, and which is assigned to us as hereinbefore recited; and we hereby authorize and request the Commissioner of Patents to issue any and all Letters Patent that may be granted on the said application of the said Daniel Drawbaugh to the said The People's Telephone Company, as the assignee of the entire right, title and interest in and to the same, for the sole use and behoof of the said The People's Telephone Company and their legal representatives, as fully and as entirely as the same would have been held and enjoyed by us had this assignment and sale not been made. In testimony of which, each of the parties hereunto have affixed their hands and seals, this fourth day of September, 1880, in the city of New York.

ASSIGNMENT MARY S. AND ERNEST MARX TO PEOPLE'S TELEPHONE COMPANY.

[Record, page 51.]

Know all men by these presents that Mary S. Marx and Ernest Marx, of the city, county and State of New York, composing the firm of Marx & Son, for and in consideration of the sum of one hundred dollars to us in hand paid, the receipt whereof is hereby acknowledged, have sold, assigned and transferred, and by these presents do sell, assign and transfer unto The People's Telephone Company, a corporation formed under the laws of the State of New York, all our right, title and interest, both as individuals and as the firm of Marx & Son, in and to the inventions and patents of Frank A. Klemm in telephone transmitters and telephone apparatus described and set forth in a certain deed of assignment from Frank A. Klemm to Ernest Marx, dated March 4th, 1880, and now of record in the United States Patent Office in Liber H 25, page 29, one of the books of record of the Patent Office, and in and to the inventions and improvements of the said Frank A. Klemm, as described and set forth in a certain deed of assignment from Abner G. Tisdel to Frank A. Klemm and Marx & Son, dated fourth day of March, 1880, now of record in the United States Patent Office, in Liber H 25, page 31, one of the books of record of the Patent Office, and all of our rights, title and interest in and to all patents that may be issued hereafter, the inventions of the said Frank A. Klemm, set forth and referred to in said two deeds of assignment now of record before recited; and we do hereby authorize and request the Commissioner of Patents to issue all Letters Patent hereafter granted on the applications of said Klemm, on the inventions and improvements set forth and referred to in said deeds of assignment to the said "The People's Telephone Company," as the assignees of our entire right, title and interest (either as individuals or as a firm), in and to the same, for the sole use and behoof of the said "The People's Telephone Company," and their legal representatives.

In testimony of which we have each of us signed our individual names and placed our seals, and the said Ernest Marx has signed the firm name this eleventh day of October, 1880.

EPHONE COMPANY,-3

CERTIFIED COPY OF AN ASSIGNMENT FROM DANIEL DRAWBAUGH TO KLEMM ET AL., RECORDED IN LIBER U^{25}, PAGE 85.

Record, page 52.]

Whereas, I, Daniel Drawbaugh, of Eberly's Mills, in the County of Cumberland, and State of Pennsylvania, have invented certain new and useful improvements in the transmission of vocal speech, and the apparatus to be used for such purpose for which I am about to make application for letters patent of the United States. And Whereas Frank A. Klemm, of the City, County and State of New York, Ernest Marx, of the same place, Simon Wolf, of the City of Washington, District of Columbia, and Moritz Loth, of the City of Cincinnati, County of Hamilton, State of Ohio, are each of them desirous of acquiring an interest in said invention, and in the letters patent to be obtained therefor.

Now, therefore, to all whom it may concern, be it known that for and in consideration of the sum of Twenty Thousand Dollars to me in hand paid, the receipt of which is hereby acknowledged, I, the said Daniel Drawbaugh, have sold, assigned and transferred, and by these presents, do sell, assign and transfer, unto the said Frank A. Klemm, Ernest Marx, Simon Wolf and Moritz Loth, the full and exclusive right to the said invention as fully set forth and described in the Specification prepared and executed by me, dated the 21st day of July, 1880, preparatory to obtaining letters patent of the United States therefor, and I do hereby authorize and request the Commissioner of Patents to issue the letters patent for my said invention to the said Frank A. Klemm, Ernest Marx, Simon Wolf, and Moritz Loth each as assignee of one undivided fourth part thereof, for the sole use and behoof of my said named Assignees and each of their legal representatives. In Testimony of which I have hereunto set my hand and affixed my seal this twenty-first day of July, 1880.

DANIEL DRAWBAUGH. [SEAL]

ARTICLES OF ASSOCIATION OF THE PEOPLE'S TELEPHONE COMPANY.

[Record, page 52.]

State of New York,
County of New York, ss.

We, Joseph Loth, of the city of New York, in the county and State of New York, Julius Bien, of the said city of New York, Richard C. McCormick, of the territory of Arizona, Marcus Marx, of the said city of New York, and Auguste H. Girard, of the said city of New York, do, by these presents, pursuant to and in conformity with the *Act* of the *Legislature* of the *State of New York*, passed on the seventeenth day of February, one thousand eight hundred and forty-eight, entitled "An Act to authorize the formation of Corporations for manufacturing, mining, mechanical, or chemical purposes," and the several acts of the said legislature amendatory thereof associate ourselves together and form a *Company* under the name and style of The People's Telephone Company; and the following are hereby declared to be

The corporate name of the said company.

The objects for which the company is formed.

The amount of the capital stock of the said company.

The number of shares of which the said capital stock of the company shall consist.

The term of existence of the company.

The number of trustees and their names.

The names of those who shall manage the concerns of the said company for the first year.

The names of the town and county in which the operations of the said company are to be carried on: —

1. The corporate name of the said company is hereby declared to be The People's Telephone Company.

2. The objects for which the company is formed are as follows: The manufacturing, constructing, owning, furnishing, maintaining, letting, and selling telephones, and the apparatus used therewith, under the inventions and patents of Abner G. Tisdel, Frank A. Klemm, Daniel Drawbaugh, and other inventions and patents which

may hereafter be assigned to said company, and the doing all things to said business or necessarily connected therewith.

3. The capital stock of the said company shall be five million dollars, which shall be divided into one hundred thousand shares of fifty dollars ($50) each.

4. The said company shall commence on the thirty first day of August, in the year one thousand eight hundred and eighty ('80), and shall continue in existence for the term of fifty (50) years.

5. The number of trustees shall be nine (9). Their names are: Joseph Loth, of the said city of New York, Edgar W. Chellis, of Harrisburg, in the State of Pennsylvania, Julius Bien, of the said city of New York, Richard C. McCormick, of the Territory of Arizona, Marcus Marx, of the said city of New York, Henry D. Cooke, Jr., of Washington, in the District of Columbia, Max D. Gutmann, of Rochester, in the State of New York, Auguste H. Girard, of said city of New York, and John N. Goodwin, of the said city of New York.

The names of those who shall manage the concerns of the said company for the first year are: the said Joseph Loth, Edgar W. Chellis, Julius Bien, Richard C. McCormick, Marcus Marx, Henry D. Cooke, Jr., Max L. Gutmann, Auguste H. Girard, and John N. Goodwin.

6. The name of the town and county in which the operations of the said company are to be carried on: the principal place of business and office of said company will be in the city of New York, in the county and State of New York. The operations of the company will also be carried on in Brooklyn, in the county of Kings, in said State.

Witness our hands and seals this thirtieth day of August, 1880.

EPHONE COMPANY,-3

EVIDENCE FOR COMPLAINANTS IN REPLY.

CIRCUIT COURT OF THE UNITED STATES, SOUTHERN DISTRICT OF NEW YORK, IN EQUITY.

American Bell Telephone Company et al. v. *The People's Telephone Company* et al.

The plaintiffs propose to take the deposition of Mr. T. A. Watson (of Everett, near Boston); whereupon it is agreed that the depositions heretofore given by Mr. Watson, and copies of which are hereto annexed, be put in evidence as his deposition in this cause with the same effect as if given herein before the examiner, and stand as evidence accordingly.

It is also agreed that the deposition of Alexander Graham Bell, referred to by Mr. Watson in his said deposition, also stand as evidence in this cause as if herein taken and sworn to, and a copy shall be filed accordingly. But the complainants shall recall said Bell for further examination or cross-examination, if either party shall so desire and request.

If Mr. Watson shall return from Europe before testimony is closed, the complainants will recall him for further examination or cross-examination, if either party shall so desire and request.

L. HILL, *for Defendants.*
J. J. STORROW, *for Complainants.*

JUNE 1, 1881.

DEPOSITION OF ALEXANDER GRAHAM BELL.

BOSTON, July 8, 1879.

Direct Examination by J. J. STORROW, Esq., *of Counsel for Complainants.*

Int. 1. Please state your name, age, residence, and occupation, and whether you are the Mr. Bell who is mentioned in the bill of complaint in this case.

Ans. I am the Alexander Graham Bell alluded to in the bill of complaint; age, thirty-two years; residence, Cambridge; occupation, electrician.

Int. 2. How early and why was your attention called to the composition and production of vocal sounds?

Ans. My father was a teacher of articulation, and as he intended me to follow his own profession, he very early gave me instruction in the anatomy of the vocal organs, the functions of the various organs of speech, and in subjects bearing generally upon the science of vocal physiology.

Int. 3. Did you, at an early age, begin to make experiments in the artificial production of vocal sounds, or speech, and in the construction of apparatus for that purpose; and if so, what did you do?

Ans. I remember when I was quite a child that my father spoke to me of some automaton speaking machine that he had seen, and aroused so much interest in me that I determined to attempt the construction of such an apparatus. I invented a speaking machine, and constructed it, as a boy, and was able to make it articulate one or two simple words.

Int. 4. When and how did you first become acquainted with Helmholtz's discoveries relating to the quality of vocal sounds?

Ans. While in the city of Elgin in Scotland, I made what I deemed to be the first discovery that the elements of speech were really compound in their nature. My father and I had been struck by the fact that whispered sounds seemed to have a pitch of their own, and we had arranged vowels in musical series. In Elgin I discovered that the position of the vocal organs for any vowel sound yielded a double resonance, and that the resonance tones, proper to the mouth cavities, could be heard mingling with the tones of the voice during the articulation of speech. I made a series of experiments to determine the characteristic tones of the vowels, and communicated the result to Mr. Alexander J. Ellis, of London, who was then, as now, considered an authority in all matters relating to speech. Mr. Ellis replied that my discovery had already been made by Helmholtz, and that Helmholtz had proved the compound nature of speech sounds, by producing such sounds synthetically, by compounding the tones of tuning forks of different pitches, which were kept in continuous vibration by means of an electrical current.

Int. 5. Are the statements contained in Prof. Cross's twentieth to twenty-fourth answers, inclusive, pages 391 and 392 [*printed record in Dowd suit*], a part of the discoveries of Helmholtz, to which you have just alluded?

Ans. They are.

Int. 6. The synthesis of vowel sounds made by Helmholtz was performed by means of an apparatus consisting of a series of tuning forks of different pitches, all of which were kept in vibration by an electro-magnet placed near their prongs, and through the coils of which intermittent currents were passed by a circuit-breaker, so that each tuning fork produced its own tone; and then by means of resonators which could be brought into action at pleasure, Helmholtz intensified these partial tones, more or less, or left some of them inaudible at the distance at which the hearer was placed, and thereby produced the quality of sound of whichever vowel he pleased, as stated in the answers of Mr. Cross just referred to; and this apparatus is shown on pages 176, 178, and 606 of Mr. Ellis's translation of Helmholtz's book. Is it not so? And when, if ever, was this apparatus first described to you?

Ans. It is so. The apparatus was described to me by Mr. Ellis somewhere about the year 1867.

Int. 7. What led you to take an interest in the subject of the production of sound by means of electrical currents?

Ans. I felt that it was my duty as a student of speech to master all the researches of others that bore upon what was to be my professional study, and I therefore desired to witness the results obtained by Helmholtz, and investigate speech for myself in the manner shown by him.

Int. 8. When did you begin to study and experiment upon the production of sound by electricity, and to what extent did you carry your study and experiments before 1870? State generally.

Ans. Immediately after the conversation with Mr. Ellis in 1867, I formed the resolution of reproducing Helmholtz's synthetical experiments, and finding that my knowledge of electricity was insufficient to enable me fully to understand his arrangement, I took up seriously the study of electricity. In the city of Bath, England, I made electrical experiments with a friend, and attempted to set a tuning fork in vibration by an electro-magnet. I do not remember the date of my visit to Bath, but I think it was in the year 1868; but it might have been earlier. From the year 1867 to 1870, I made numerous electrical inventions based upon Helmholtz's vowel apparatus, and before I left England, in 1870, I had made up my mind to pursue one of these inventions to a practical end. The invention to which I allude is now known as harmonic telegraphy or multiple telegraphy.

Int. 9. Did you, at that time, have any ideas as to the practicability of transmission of speech by means of electricity; and if so, to what extent?

Ans. From the moment that I became aware that Helmholtz had been able to produce vowel sounds with the aid of electricity, I believed that the other elements of speech might also be produced in a similar manner. I did not, while in England, form any idea of the details of an apparatus for producing speech in this way, but I did very distinctly have the belief that it was possible to construct such an apparatus. I am sure that I stated to friends in England, before 1870, my belief that we should one day speak by telegraph, but I had no idea that I would ever myself be connected with the realization of such a plan.

Int. 10. When did you and the rest of your father's family come to America to live?

Ans. In August, 1870, we went to Canada, to Brantford, Ontario, where my parents still reside.

Int. 11. When did you first come to Boston, and for what purpose?

Ans. I came to Boston on the 1st of April, 1871, at the invitation of the Boston School Board, for the purpose of carrying on experiments with my father's system of physiological symbols in the Boston School for the Deaf. The object of the experiments was to test the practicability of teaching those who are usually called "deaf and dumb" to use their vocal organs so as to articulate intelligibly.

Int. 12. When did you come to Boston to live permanently?

Ans. On the 1st of October, 1872.

Int. 13. While you were in Canada and Boston, say up to the year 1873 or 1874, how much attention did you pay to the subject

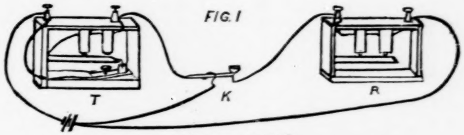
EPHONE COMPANY,-3

of electricity, and what particular use of electricity did you study and experiment upon?

Ans. From the moment of my arrival in Canada in 1870, up to the commencement of 1874, my mind was full of the scheme for the multiple transmission of telegraphic messages by means of musical tones to which I have already alluded. Up to October, 1872, I resided at my father's house in Canada, paying only occasional visits to the United States, each visit continuing for about two months. I had few facilities for experiment in Canada during that time, and none in the United States. I occupied myself chiefly during my leisure time in studying the subjects of electricity and sound, and in developing theoretically the practical details of my system of harmonic telegraphy. I also made such experiments as I could with the limited facilities at my command, at my father's house in Canada. From October, 1872, up to the commencement of 1874, I devoted all my spare time to practical experiments relating to the production of sounds by electrical means, with the object of reducing to practice the system of harmonic telegraphy. My daytime was completely occupied with professional work, and I carried on my electrical experiments chiefly at night.

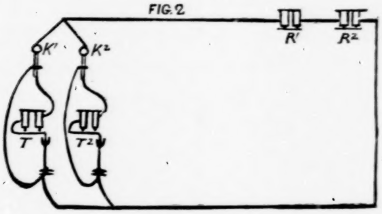
Int. 14. I call your attention to Figs. 1 and 2 in the drawing now shown you: when did you construct and use the apparatus therein shown?

FIG. I



(NOV. 1873)

FIG. 2



(NOV. 1873)

Ans. In November, 1873.

Int. 15. Where?

Ans. In Salem, Mass.

Int. 16. Have you one of the originals of the apparatus there shown? If so, please produce it and state which of those figures it is like.

Ans. I have, and I now produce it. It is a portion of a transmitting instrument like that shown at T, Fig. 1. All the parts are there except the mercury cup and wire to dip into it; one screw cup and a connecting wire also missing.

Int. 17. When and upon what occasion were Figs. 1 and 2, or the figures of which these are lithographic reproductions, drawn by you?

Ans. They were drawn by me some time before the 27th of April, 1876, as part of the illustrations of my preliminary statement in an interference at the Patent Office upon harmonic telegraphy.

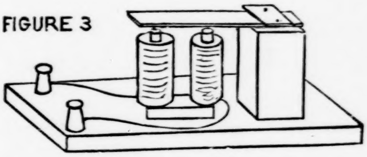
Int. 18. State whether you used at that time, in 1873, similar reeds and electro-magnets as receivers, attaching the reed directly to the base or a standard coming from the base instead of using the large box shown in these figures?

Ans. I did, in November, 1873. The receiving instrument usually employed by me at that time consisted of an arrangement almost identical with the instrument now shown. This very instrument was frequently used by me at that time as a receiver, by untwisting the wires which connect the electro-magnet with the steel plate armature and passing the intermittent current from one of the interrupters through the coils of the electro-magnet, without passing through the plate. During the month of November, 1873, I varied the shape and size of the frame holding the receiver so as more conveniently to get at the plate in order to tune it to its proper transmitter. One of my favorite forms of receivers consisted of an arrangement substantially like the model shown, turned upside down, with the bottom of the box (then forming the top) removed, so that the reed was attached to a standard coming from the base. I found this form especially advantageous, as I could remove the plate and substitute others of different lengths and thickness.

LEPHONE COMPANY,-3

I now make a drawing of my favorite form of receiving instrument in November, 1873.

FIGURE 3



Int. 19. If you ever heard, from a single one of those receivers, tones of different pitches transmitted by transmitters of different pitch, please state when you first did so, describe what you heard, and the circumstances under which you heard it.

Ans. In November, 1873, I arranged two current-interrupters and two harmonic receivers upon a single circuit, as shown in Fig. 2. The details of the instruments will be understood from Fig. 1. The plate armature of the receiver R^1 was intended to have the same normal rate of vibration as that of the interrupter T^1, and the plate armature of R^2 was intended to have the same rate as that of T^2. It was expected that upon depressing the key K^1, the intermittent current from the interrupter T^1 would traverse the circuit in which the receivers R^1 and R^2 were placed, and cause the reed of R^1 to be thrown violently into vibration, so as to produce its musical tone, and that the reed of R^2 would not respond in the same manner. It was also anticipated that upon depressing the key K^2, the reed of R^2 would be thrown violently into vibration, but that that of R^1 would not. And that upon depressing both keys K^1 and K^2 simultaneously, the reeds of both receiving instruments R^1 and R^2 would be thrown violently into vibration, producing musical tones at the receiving station of similar pitch to the tones produced at the transmitting station by the vibration of the interrupters T^1 and T^2. Upon making the experiment, the results were as follows: Upon depressing K^1, the reed of R^1 was thrown violently into vibration, as had been anticipated, producing a musical tone similar in pitch to that produced by T^1, and R^2 was not sensibly affected, save by a slight trembling, which was perceptible to the sense of touch. Upon depressing the key K^2, neither of the reeds R^1 and R^2 was thrown into violent vibration, but both were affected by a slight trembling, which could be felt with the finger. Upon depressing K^1 and K^2 simultaneously, the reed R^1 was thrown into violent vibration, but that of R^2 was not. The results were in accordance with the theory upon which my system of harmonic telegraphy was based, only upon the supposition that the reed of R^2 was not in unison with that of T^2. Upon placing my teeth against the frame to which the reed R^2 was attached and plucking the reed with my finger, I clearly perceived that its pitch was different from that of its proper transmitter T^2. I tried many experiments to tune the reed of R^2, and in the course of these experiments I remodelled the receiving instrument R^2, as shown in Fig. 3, and shifted the position of the reed upon its support, so as to make its free portion longer or shorter, in the attempt to cause its normal rate of vibration to correspond to that of its proper transmitter. I also made the free portion of the reed purposely too short, so that it should have a higher rate of vibration than that of its proper transmitter, and sought to lower its tone by weighting it with lumps of wax. During the course of these experiments, while I happened to have the keys K^1 and K^2 simultaneously depressed, the idea occurred to place my ear against the receiving reed shown in Fig. 3, which was trembling perceptibly to the sense of touch, but which had not been properly adjusted, so as to correspond with its proper transmitter. Upon placing my ear against the reed, I heard two musical tones, the unisons respectively of those produced by T^1 and T^2, seemingly proceeding from that one reed. The reed of R^1, however, was vibrating with great violence in another part of the same room, producing a tone of similar pitch to that produced by T^1, so that I was uncertain whether that tone was produced from the instrument at my ear, or whether it had been mechanically communicated to my ear through the air from the receiver R^1. To test this point, I removed the receiver R^1 from the circuit, leaving R^2, which was then in the condition shown in Fig. 3, in circuit with the two transmitters T^1 and T^2. Upon placing my ear against the receiver R^2, I then clearly perceived two tones proceeding from it, which were similar in pitch to the tones produced by the transmitters T^1 and T^2, and different from that normally produced by the reed of R^2 when plucked by the finger. This experiment was made in Salem, Mass., during the month of November, 1873.

Int. 20. Whether or not, afterward, in the ordinary course of your operations in harmonic telegraphy or with vibrating reed receivers, you availed yourself of this phenomenon of the production in the receiving reed of feeble forced vibrations of the same rate as the rate of the circuit interrupter, but differing in rate from the more ample vibrations which took place when the impulses came with periods corresponding to the normal rate of the receiving reed; and if so, to what extent, and how often, and for what purposes?

[*Question objected to and withdrawn.*]

Int. 20*a*. Did you afterwards in your ordinary operations in the vibrations of reeds, when used as receivers, avail yourself of the phenomenon described in your last answer; and if so, to what extent and for what purpose?

Ans. It was constantly my custom after November, 1873, to observe the feeble forced vibrations produced in the reed of a receiver by the action of a current interrupter of different rate from its own, by placing my ear against the reed. It was my usual method of ascertaining whether to shorten or lengthen the reed of the receiver. When the tone electrically produced was lower in pitch than that produced by plucking the reed by the finger, I lengthened the free portion of the reed, but when the forced vibrations were of higher rate than the free vibrations of the reed, I shortened the vibratory portion of the reed, and thus adjusted its pitch to correspond to that produced by its proper interrupter.

Int. 21. How early did you arrange your multiple telegraph instruments with an induction coil placed between the interrupter and the receiver?

Ans. In the winter of 1873, I think about December.

Int. 22. State whether the drawing now shown you is a correct representation of the manner in which you arranged the apparatus with an induction coil, and state when and for what purpose this drawing, Figs. 4, 5 and 6, was made.

Ans. Figs. 4 and 5 represent correctly the manner in which I arranged the apparatus with induction coils, in December, 1873, and Fig. 6 represents an improvement of the arrangement, devised about the commencement of the year 1874. This drawing, Figs. 4, 5 and 6, was made previously to April 27, 1876, and formed part of the illustrations of my preliminary statement in the harmonic-telegraph interference before referred to.

Int. 23. When, if ever, did you become familiar with the Scott phonautograph, referred to in Prof. Cross's twenty-eight answer, page 395?

Ans. In the winter of 1873–74.

Int. 24. Did you during that winter construct any phonautographs yourself?

Ans. I did; early in 1874.

Int. 25. In those that you constructed, how was the rod which

LEPHONE COMPANY,-3

carried the style attached to the phonautograph frame, and how was it moved by the membrane?

Ans. One end of the rod was hinged by means of a piece of leather or calico to the edge of the circular frame carrying the membrane. A small piece of cork was fastened to the centre of the membrane and to the rod. Upon uttering a sound in the neighborhood of the membrane it was caused to vibrate, and force the rod to vibrate also. The free end of the rod projected considerably beyond the opposite edge of the membrane, and its vibrations were recorded on smoked glass.

Int. 26. Did you use in your phonautographs a paraboloidal mirror to concentrate the sound waves between the speaker and the membrane; if not, what form did you give to that part of the apparatus which conducted the sound waves from the mouth of the speaker to the membrane?

Ans. I did not use the paraboloidal mirror excepting in experiments with Prof. Cross, at the Institute of Technology, with the instrument he has described in his deposition. In all the phonautographs constructed by myself in the early part of 1874, I used a rubber tube, with a mouthpiece similar to those employed in speaking tubes.

Int. 27. Whether or not during that winter you devised any apparatus for reproducing, by means of phonautograph sound tracings, sounds similar to those which had made the tracings; and if so, describe what it was and how it was to operate.

Ans. I did. A phonautograph tracing was to be drawn on a hollow metallic cylinder, so arranged as to be capable of rotating on a vertical axis. The tracing was then to be cut so as to form a sinuous slit, and air was to be blown through the tracing from a pipe whose nozzle was contracted to a vertical slit. A pencil of air would thus be expelled at the points of intersection, and the rotation of the cylinder would cause this pencil of air to vibrate in the same manner as the air had been moved by the voice of the speaker when the original tracing had been made. I presumed, therefore, that the rotation of the cylinder would cause a sound to be heard similar in quality to that which had produced the tracing.

Int. 28. Did you construct such an apparatus at any time?

Ans. I did not.

Int. 29. Did you, during the year 1874, use any phonautograph of an entirely different character from those which you have described; and if so, what was it?

Ans. I used during the year 1874 a phonautograph which was made from a human ear. The middle ear was exposed by dissection, and a style of hay was attached to the end of the *incus* in place of the *stapes.* Upon uttering sounds into the external ear, I found that the hay attached to the *incus* vibrated sufficiently to enable me to obtain tracings of vocal sounds upon smoked glass.

Int. 30. Did you, during the year 1873 or 1874, devise a receiver in which there was a polarized reed and an electro-magnet? And if so, describe it, and state when you devised it.

Ans. In the winter of 1873-74 I devised a receiver in which the reeds were to be polarized by being attached to the poles of permanent magnets, and they were to be placed opposite the poles of electro-magnets. My method was to attach one reed to each pole of a permanent horseshoe magnet, the free end of each reed projecting over one pole of a horseshoe electro-magnet. Upon this plan, I had one permanent magnet and one electro-magnet for each pair of reeds.

Int. 31. Where did you spend your summer vacation in 1874?

Ans. In Brantford, Ontario, at my father's house.

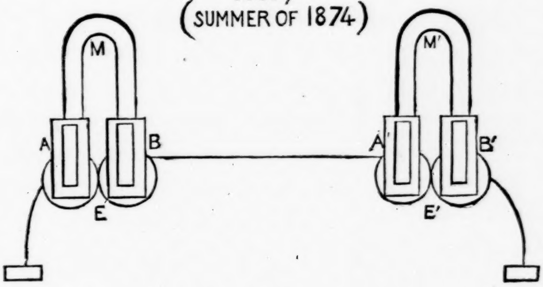
Int. 32. During that summer, did you devise a magneto-electric transmitter to work without a battery? And if so, describe it.

Ans. I did. I saw that the receiver with polarized reeds, which I have just described, could be made to produce electrical currents if the reeds were caused to vibrate mechanically. I therefore devised an arrangement whereby each reed should be enclosed in a bed, so arranged that the reed could be set in vibration by wind in the ordinary manner, as in organ reeds.

Int. 33. Is the arrangement you have just referred to shown in the drawing Fig. 7; and if so, when and for what purpose was the drawing Fig. 7 made?

Ans. Two pairs of reeds, arranged in the manner referred to, are shown in Fig. 7. This drawing was made as part of the preliminary statement above referred to.

FIG. 7
(SUMMER OF 1874)



Int. 34. What characteristics of sound did you then understand that that transmitter would produce from the receiver in the apparatus Fig. 7?

Ans. I understood that the vibration of one of the reeds of the transmitter would not only cause the forcible vibration of the reed of the receiver of similar pitch to itself, but that the amplitude of the vibration of the transmitting reed would control the amplitude of the vibration of the receiving reed, and hence control the loudness of the sound produced from the receiver.

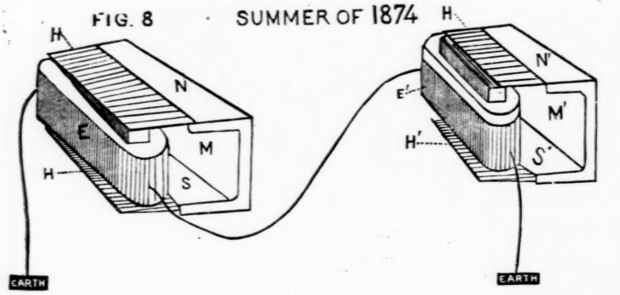
Int. 35. Why and how would the amplitude of the vibration of the transmitting reed control the amplitude of the vibration of the receiving reed?

Ans. I understood from the well-known laws of magneto-electricity that a current of electricity would be induced in the coils of the electro-magnet E, Fig. 7, when any one of the transmitting reeds A moved downwards or upwards, and that the strength of the current would be proportional to the velocity of the motion of the reed. I therefore inferred that as the velocity of motion of the reed was increased when the amplitude of its vibration was increased, that the strength of the current produced by the vibration was also increased. In considering the effect upon the corresponding reed A′ of the receiver, it was evident that the violence of its vibration depended upon the strength of the electrical impulses passed through the coils of the electro-magnet E. I therefore reasoned that the more violent the vibration of any transmitting reed, the more violent would be the vibration of the corresponding receiving reed, and the less violent the vibration of the one, the less violent the vibration of the other.

Int. 36. In the apparatus with polarized reeds which you have been describing, you appear to have had one horseshoe permanent magnet and one horseshoe electro-magnet for each pair of reeds: did you during the same summer of 1874 devise any plan for reducing the number of magnets employed; and if so, what apparatus did you devise for that purpose? Please illustrate your answer by a diagram of it.

Ans. I did.

FIG. 8 SUMMER OF 1874



In the apparatus shown in Fig. 8, which is one of the illustrations to the preliminary statement referred to before, all the reeds were to be attached to the poles of a single horseshoe magnet, and a single elongated straight bar electro-magnet was to be employed. This arrangement was devised during my summer vacation in 1874.

Int. 37. If during that summer you had any ideas concerning the transmission of articulate speech by electricity, state by what kind of an apparatus you thought to do it and how you expected to operate such an apparatus.

Ans. I was at that time acquainted with Helmholtz's theories and experiments, and believed that any of the sounds of speech could be produced by producing the musical tones of which such sounds were known to be composed, with their proper relative intensities. I was also familiar with the well-known experiment of articulating to an undamped piano. I had frequently pronounced vowel sounds in the neighborhood of an undamped piano, and had observed that an approximation to the vowel uttered was produced by the vibration of the strings of the piano after my voice has ceased. I knew that those strings of the piano which corresponded in pitch to the fundamental and upper partials or overtones of the vowel uttered had been set sympathetically into vibration with amplitudes corresponding to the loudness of the component tones, and that they continued vibrating with the proper relations of force for a perceptible time after the voice had ceased, as evidenced by the reproduction from the piano of the quality of the sound which had been uttered into it. I therefore conceived that a similar apparatus to that shown in Fig. 8 could be operated by the voice of a speaker, and that a sound would be produced by the receiving apparatus shown in Fig. 8, similar in quality to that which had operated the transmitting apparatus. For those reeds or springs of the transmitting telephone H, Fig. 8, which corresponded in pitch to the fundamental and upper partials of any sound uttered in their neighborhood would, like the strings of the piano, be thrown sympathetically into vibration, the amplitude of the vibration of the different reeds corresponding to the loudness of the corresponding partial tones. And the reeds of the receiving telephone H′, corresponding in pitch to the fundamental and upper partials of the sound uttered at the transmitting end, would be thrown into vibration with corresponding relations of force, and a sound would be produced from the receiving instrument H′ of similar composition to that uttered at the transmitting end. Hence the quality of the original sound would be reproduced. I therefore conceived if the reeds or rods of the instruments shown in Fig. 8 were made very numerous, and the differences of pitch between adjoining reeds very slight, that a person might speak in the neighborhood of one of the instruments shown in Fig. 8, and his articulation be reproduced by the other instrument; and that thus vocal utterance could be electrically transmitted.

Int. 38. Did you ever build such an apparatus as Fig. 8; and if not, why not?

Ans. I did not, because of the great number of reeds that would be required, and because I saw that the instrument could be very much simplified.

Int. 39. Did you at any time during that summer conceive of any plan by which you could materially reduce the number of reeds required in such an apparatus for the transmission of speech? and if so, what was your conception, and what modification, if any, did you expect to make in the arrangements for vibrating the transmitting reeds which you did retain?

[*Objected to as incompetent.*]

Ans. In considering the action of the apparatus shown in Fig. 8, I saw, however numerous might be the reeds which were set in vibration by the voice of a speaker, that as there was only one electro-magnet, an effect would be produced in that magnet which would be a resultant of the vibration of the reeds; and I saw that this resultant effect might be produced in the electro-magnet by a single reed vibrated in such a manner as to represent the resultant of all the vibrations. I conceived that a single reed could be moved by the voice of a speaker in this manner by attaching it to a stretched membrane, and speaking against the membrane.

Int. 40. What experience had you had in vibrating, by means of the human voice, membranes which were so loaded or arranged that some work had to be done by the sound waves besides moving the membrane itself?

Ans. I had made many experiments with phonautographs in which membranes operated by the human voice had not only moved levers of considerable length, at a mechanical disadvantage, but had caused such levers to perform considerable mechanical work in scraping lampblack from glass slides so as to form enlarged tracings of the aerial vibration. I was also familiar with Koenig's Manometric Flame Apparatus, the membrane of which was caused by the voice to vibrate against the pressure of gas admitted into the capsule from the ordinary gas pipes, so as to create a sensible vibration in the flame at the orifice of a capillary tube. At the very time also when this conception occurred to me, I was obtaining tracings of the vibrations of the bones of a human ear, and I reasoned that the disproportion in mass between the tympanic membrane and the bones that were moved by it was much greater than that existing between a membrane like that used in the phonautograph and the reed which I proposed to operate by it.

[*Adjourned to July* 9, 1879, *at* 11 *A. M.*]

BOSTON, July 9, 1879.

Int. 41. What is the size of the membrane of the human ear?

Ans. The specimen used by me was about the size of a silver half-dime.

Int. 42. Did you, at that time, construct the apparatus described in your fortieth answer?

Ans. I did not.

Int. 43. Why not?

Ans. Because I had the idea that the magneto-electric currents produced by the operation of the voice would be too feeble to produce practically useful results.

Int. 44. Did you, during that summer and while in Canada, describe to any one that apparatus and communicate to them your idea as to the transmission of articulate speech by it; and if so, to whom?

Ans. I did. I had many conversations on the subject with my father, and I believe with friends, and I distinctly recollect making drawings of the harp arrangement to illustrate the subject to some person or other at my father's house in Canada, during the summer of 1874; and I remember directing some person's attention to the human ear, with which I was experimenting, as a proof of the correctness of my membrane idea. I also have some recollection of having a discussion regarding the membrane idea, and directing attention to the massive nature of the bones of the ear when compared to the tympanic membrane. I cannot remember these discussions with any detail, but simply remember holding this human ear in my hand and directing attention to it, as an illustration of some theory I was discussing concerning the reproduction of speech by electrical means.

Int. 45. When did you return to Boston after your vacation in that summer of 1874?

Ans. About the end of September or the first of October.

Int. 46. Did you, after your return to Boston, describe to any one in Boston your harp arrangement or your plan for the transmission of articulate speech; and if so, to whom, when and where?

Ans. I did. I described my method for the transmission of articulate speech to Dr. Clarence J. Blake, at his office in the Hotel Berkeley, a few days after the 21st of October, 1874. I also described this method to Mr. Moses G. Farmer, to Prof. Lovering, and to one of the professors of the Institute of Technology, during the latter part of 1874. I also spoke of it to Mr. Thomas Sanders, in Salem, Mass., and to Mr. Gardiner G. Hubbard, in Cambridge, during October, 1874.

Int. 47. Did you at Dr. Blake's, upon the occasion referred to in your last answer, make any sketches to illustrate your description of your inventions; if so, will you please produce them?

Ans. I did, and I now produce them.

Int. 48. One of these sheets, which is marked "Nor 7," contains figures on both sides: please to state what the figures on the first side represent.

Ans. The larger figure on that side, which for convenience I will call Fig. 1, though the figures are not numbered in this drawing, refers to my apparatus for inducing currents of electricity by the vibration of polarized reeds, arranged like organ reeds, to be blown by wind, and is the same arrangement shown before in Fig. 7, and referred to in my thirty-third answer. The other figure on that side, which I shall call Fig. 2, represents an arrangement for increasing the effect produced by the vibration of the reeds. I had the idea that magneto-electric currents generated by the vibration of a polarized tongue were very feeble, and therefore sought to increase the effect by combining together three permanent horseshoe magnets, as illustrated in this figure. Two of these permanent magnets, the poles of which are marked respectively N, S, N, S, are represented as covered with coils of insulated wire, and between the poles of the opposite magnets are shown in section the ends of the polarized reeds illustrated in plan in Fig. 1 of that side.

Int. 49. What do the drawings on the other side of this sheet represent?

Ans. One of them, which I will call Fig. 3, represents a galvanometer in circuit with a straight bar electro-magnet, over the pole of which a polarized or magnetical tongue is placed. This drawing was made for the purpose of explaining to Dr. Blake the peculiarities of the electrical current produced by the vibration of a magnet in front of an electro-magnet. The other illustration, which I shall term Fig. 4, represents the first apparatus I had conceived for the transmission of vocal utterance electrically. This is the same harp instrument shown before in Fig. 8 and referred to in my thirty-sixth answer.

[*Complainants put in the sheet referred to in the last two answers, and it is marked " Complainants' Exhibit 30,* Dr. C. J. Blake Drawings, W. P. Preble, Jr., Examiner," and the figures on it are numbered by the examiner as mentioned by the witness.*]

Int. 50. Did you have any conversation on that occasion with Dr. Blake as to whether the human voice could vibrate the membrane with attached armature; and if so, state what, and whether any drawings were made by either of you to illustrate that topic.

Ans. I have a recollection of asking Dr. Blake's opinion on this point, and the impression that I got from his remarks was that it could if the membrane were made concave, like that in the human ear, and if the end of the armature were attached, not to the centre of the membrane, but to a point a little to one side, corresponding to the point of attachment of the malleus and tympanic membrane of the ear. I do not recollect whether any drawing was made of this idea at that time, but I remember our discussing the operation of the harp arrangement, marked " Fig. 4 " in Exhibit 30, and comparing the apparatus to the organ of Corti in the human ear I remember also that Dr. Blake suggested that a damping arrangement would have to be attached to the harp arrangement, and that he made a drawing of the manner in which the rods of Corti were damped in the ear.

Int. 51. You say that this first conversation on this subject with Dr. Blake was soon after the 21st of October, 1874: how do you fix that date?

Ans. By reference to a letter that I received from him, dated Oct. 21, 1874, in which he referred to some letter that he had received from Mr. Elisha Gray concerning experiments in telegraphing "vocal" sounds. [I visited Dr. Blake within a day or two after receiving his letter, and told him that I did not wish to see Elisha Gray's letter, as I was then engaged upon the problem of the transmission of articulate speech by electricity, and did not wish to be indebted to any one for information upon the subject.] I then explained to him my method and made the drawings that have been put in evidence, and made other drawings illustrating my system of harmonic telegraphy, for which I was then applying for protection in the Patent Office. I know that all these drawings were made within a few days after receiving Dr. Blake's letter referred to.

---

* The exhibits have been renumbered for the pending case of American Bell Telephone Company *v.* People's Telephone Company, and the number of said exhibit in said pending case is No. 18.

[*Passage in brackets objected to as incompetent.*]

Int. 52. When did Mr. Sanders and Mr. Hubbard become interested in your inventions for multiple telegraphy?

Ans. In the autumn of 1874, shortly after my return from Canada.

Int. 53. Did you have some conversations with Prof. Henry at the Smithsonian Institute in Washington, in February or March, 1875, upon the subject of your electrical inventions?

Ans. I had.

Int. 54. Did you at or about the time of that conversation make any memorandum of it; and if so, in what form and for what purpose did you write down the substance of it?

Ans. I did. I wrote an account of my conversation with Prof. Henry in the form of a letter for the information of my parents in Canada.

Int. 55. Was that letter sent to your parents at the time it was written?

Ans. It was.

Int. 56. Whether or not the statements contained in that letter as to your conversations with Prof. Henry are correct?

Ans. They are.

Int. 57. Will you please produce that letter, and read from it as part of your answer what relates to those conversations, omitting the personal and family matters?

[*Objected to as incompetent.*]

Ans. I produce it, and read from it the following: —

"292 ESSEX STREET, SALEM, March 18, 1875.

"*Dear Papa and Mamma:*

"I have just returned from my trip to New York, thoroughly worn out. Found your letters of the 14th inst. awaiting me. I am now beginning to realize the cares and anxieties of being an inventor. In order to complete the apparatus as thoroughly as possible, I have decided to give up all professional work for some weeks. I have put off all pupils and classes until the 12th of April. Flesh and blood could not stand much longer such a strain as I have had upon me. Professional work is all in confusion, and the only way is to cut the Gordian knot and throw up everything till the end is achieved. I long to write full accounts to you, and I have delayed writing in order to give a connected narrative of the whole. You seem to think that my anxieties are over, when in truth they are really only beginning.

"Before entering upon explanations, let me ask you first to hunt over all my old letters that you have preserved for everything bearing on the Telegraph. Forward to me at once as evidence. I must take action at once in regard to foreign patents. Will you or uncle help me in this?

"What I would like is this. I have written to my lawyers in Washington to make application for foreign patents on my own responsibility.

"Should I prove unable to pay for these applications at once, will you help me? While these applications are being got out I shall write to the Herdmans, offering them a share if they will take the pecuniary burden of any interference, etc., that may arise abroad from Mr. Gray. Should they decline, — which I should think unlikely, — I should of course relinquish a foreign contest. . . .

"Whenever I am free to dispose of my interest in the invention I shall do so, and then you may expect to see Visible Speech go ahead. I can then take up the electro-motor, which I think as valuable an idea as this telegraph.

" . . . Now, to resume telegraphy. When I was in Washington I had a letter of introduction to Prof. Henry, who is the Tyndall of America. I had found on inquiry at the Institute of Technology that some of the points I had discovered in relation to the application of acoustics to telegraphy had been previously discovered by him. I thought I would, therefore, explain all the experiments, and ascertain what was new and what was old. He listened with an unmoved countenance, but with evident interest, to all; but when I related an experiment that at first sight seems unimportant, I was startled at the sudden interest manifested.

"I told him that on passing an intermittent current of electricity through an empty helix of insulated copper wire, a noise could be heard proceeding from the coil, similar to that heard from the telephone. He started up, said, 'Is that so? Will you allow me, Mr. Bell, to repeat your experiments, and publish them to the world through the Smithsonian Institute, of course giving you the credit of the discoveries?'

"I said it would give me extreme pleasure, and added that I had apparatus in Washington, and could show him the experiments myself at any time. He asked if I could do it *then*, if he went with me, and I told him that I had everything in readiness at Mr. Hubbard's house. He said, 'I will go with you now. Have you a carriage here?' I had not, and so he put on his coat and was about to order his carriage, when I offered to save him the trouble of going out on such a raw, damp day, by bringing the apparatus to the Smithsonian Institute. (He was suffering from a cold, and besides is very aged, — I believe about eighty years old.)

"We appointed noon next day for the experiment. I set the instrument working, and he sat at a table for a long time with the empty coil of wire against his ear, listening to the sound. I felt so much encouraged by his interest that I determined to ask his advice about the apparatus I have designed for the transmission of the human voice by telegraph. I explained the idea and said, 'What would you advise me to do: publish it and let others work it out, or attempt to solve the problem myself?' He said he thought it was the germ of a great invention, and advised me to work at it myself instead of publishing. I said that I recognized the fact that there were mechanical difficulties in the way that rendered the plan impracticable at the present time. I added that I felt that I had not the electrical knowledge necessary to overcome the difficulties. His laconic answer was, 'GET IT.'

"I cannot tell you how much these two words have encouraged me. I live too much in an atmosphere of discouragement for scientific pursuits. Good ——— is unfortunately one of the *cui bono* people, and is too much in the habit of looking at the dark side of things. Such a chimerical idea as telegraphing *vocal sounds* would indeed to *most minds* seem scarcely feasible enough to spend time in working over. I believe, however, that it is feasible, and that I have got the cue to the solution of the problem.

"Prof. Henry seemed to be much interested in what I told him, and cross-questioned me about my past life, and specially wanted to know where I had studied physics. . . .

"Having left Prof. Henry and Washington, I proceeded to New York, where I saw Mr. Orton, and Mr. Prescott the electrician. Arrangements are made for me to bring my instruments to New York and experiment on a real line wire.

"I left Boston last Sunday and called at the office of the Western Union on Monday. Mr. Orton and Mr. Prescott both devoted a large portion of their time in discussing with me the whole plan from its theoretical point of view. Mr. Smith, the manager of the experimental room, was absent from town, but was telegraphed for. He replied that he could not come till next morning. Tuesday forenoon we had batteries connected, and I tuned up my instruments. They went like clockwork. I have come to the conclusion that by a happy chance they are much more perfect than I thought at first. The signals are as clear, sharp and rapid as with the ordinary Morse sounder. I connected two transmitters and two receivers on only one line, and two messages were sent simultaneously.

"We had 100 cells of a battery, and all went well on our artificial circuit. Mr. Prescott then said he would like to see them tried on a real line wire. He telegraphed to Philadelphia to have two wires crossed there so as to give us (practically) a continuous wire from New York to Philadelphia and back. The electro-magnets I employed were not intended for trial on a long line. They were wound with coarse wire and the 'resistance' was only '3 ohms.' Ordinary electro-magnets for actual service on a line have a resistance of about

200 to 600 ohms. None of us, therefore, expected the instruments to work without stronger magnets. But they *did work.* The signals, though feeble, came sharply and concisely through the 200 miles of line wire !!! I suggested trying stronger magnets, so Mr. Prescott ordered the instruments to be taken to the workshop and stronger magnets placed on them. They were to be ready in the afternoon, so I went out to dinner and returned in a couple of hours.

"Rest will form subject for next letter.

"With fond love,
"Your ever affectionate son,
"ALECK.

"PROF. A. M. BELL,
Brantford, Ontario."

[*The original letter is marked for identification by the examiner, with his initials and the date, July* 9, 1879, *on each of the five leaves.*]

Int. 58. What do you mean by the phrase "visible speech" in that letter?

Ans. "Visible speech" is the name of my father's system of physiological symbols, which I was using as a means of teaching articulation to the deaf, and has no reference to electricity or telegraphy.

Int. 59. The letter refers to an interference with Mr. Gray: were you then in interference with him at the Patent Office; and if so, upon what subject?

Ans. I was then in interference with Mr. Elisha Gray upon the subject of harmonic multiple telegraphy.

Int. 60. The letter refers to an exhibition which you made in the presence of Mr. Orton and Mr. Prescott, of the Western Union Telegraph Company: what kind of apparatus or system was the subject of that exhibition?

Ans. The experiment was made to illustrate my method of multiple transmission of telegraphic messages.

Int. 61. Whether or not you occupied yourself in studying and experimenting upon your electrical inventions during the spring and summer of 1875?

Ans. I did.

LEPHONE COMPANY,-3

Int. 62. Did you, at the time of its date, May 4, 1875, write and send to Mr. Gardiner G. Hubbard a letter which is now shown you, and which was referred to and identified in the deposition of Mr. Hubbard on pages 431* and 440 of the record?

Ans. I did.

Int. 63. Please to read from it, as part of your answer, that part of it which begins at the top of the third page, and from thence to the end.

[*Objected to as incompetent.*]

Ans. I do so. It is as follows: —

"SALEM, MASS., May 4, 1875.

"*Dear Mr. Hubbard:*

" . . . Letter received from Mr. Pope, with directions for preparing paper. Letter received from Prof. Henry of the Smithsonian Institute, in answer to one I wrote him some time ago telling him of recent experiments undertaken in order to determine the cause of the sound heard from the empty helix of wire.

"The deduction I had made from the experiments was that an intermittent current of electricity creates a molecular vibration in the conductor through which it is passed. Prof. Henry writes that he believes that my experiments are new, and that my explanation of the cause of the sound is in his opinion correct.

"An experiment which I have long desired to make is at last within my reach. My friend, Don Manuel Fenollosa, whose music rooms are next door to this house, is to allow me to experiment with his pianos. I shall carry a wire from my study into his room to-morrow, and try the effect of passing an intermittent current through the strings of a piano. Unless I am greatly mistaken, the string, whose rate of movement coincides with the molecular vibration induced in the wires by one of my transmitters, will resound loudly.

"Another experiment has occurred to me which, if successful, will pave the way for still greater results than any yet obtained. The strings of a musical instrument in vibrating undergo great changes of *molecular tension*. In fact, the vibration represents the struggle between the tension of the string and the moving force impressed upon it. I have read somewhere that the resistance offered by a wire to the passage of an electrical current is affected by the *tension of the wire*. If this is so, a *continuous current of electricity* passed through a vibrating wire should meet with a varying resistance, and hence a pulsatory action should be induced in the current. If this turns out to be the case, the oscillations of the current should correspond in *amplitude*, as well as in the rate of movement, to the vibrations of the string. One consequence would be that the *timbre* of a sound could be transmitted. The plan for transmitting *timbre* that I explained to you before — viz., causing permanent magnets to *vibrate* in front of electro-magnets — is chiefly defective on account of the feebleness of the induced currents. If the other plan is successful, the strength of the current can be increased *ad libitum*, without destroying the *relative intensities of the vibrations*.

---

"Yours respectfully,

"A. GRAHAM BELL.

"GARDINER G. HUBBARD, Esq.,
Cambridge, Mass."

Int. 64. In the letter of May 4, you speak of certain experiments which you propose to try, one of which you supposed would cause pulsations or oscillations in the electrical current by means of varying the resistance of its conductors, and you say that one consequence would be that the *timbre* of a sound could be transmitted: how did you expect that this variation of resistance would reproduce the *timbre* of a sound?

Ans. The experiment referred to was tried a day or two after the 4th of May. I expected that an instrument constructed with a large number of wires, arranged as in a piano, could replace the transmitting harp arrangement shown in Fig. 8, and referred to in my thirty-sixth answer. I had the idea that magneto-electric currents, generated in the way shown in Fig. 8, would be too feeble for practical purposes, and conceived that a more powerful and similar effect could be produced by keeping the electro-motive force of my circuit constant, and interposing a varying resistance. I thought that upon speaking to a harp arrangement of stretched wires, through which a continuous current of electricity was passed, that the strings corresponding in pitch to the musical constituents of the sound uttered would be thrown sympathetically into vibration, and that the amplitude of the vibration of each string would correspond to the loudness of the corresponding partial tone of the sound uttered, and that the battery current would meet with a varying resistance on account of the varying tension of the wires through which the current was passed, and that the variations in the strength of the current thus produced would cause the vibration of those reeds of the receiving-harp arrangement, shown in Fig. 8, which corresponded to the stretched strings which were vibrated by the voice; and that the amplitude of the vibration of each reed would be dependent upon the amplitude of the vibration of the corresponding stretched string, and that thus the quality of the sound produced from the receiving-reed arrangement would be similar to the quality or *timbre* of the sound uttered in the neighborhood of the stretched-string harp arrangement. I also thought that it might be possible to dispense altogether with the reed arrangement shown in Fig. 8, and that a stretched-string harp arrangement might be used as a receiver; for I believed at the time this letter was written that the passage of a varying current through a conducting wire occasioned a molecular vibration in that conductor, and I therefore thought that the varying current from a stretched-string harp transmitter would, when passed through the strings of another similar apparatus, occasion a molecular vibration in those strings, and that the strings of the receiver which were in unison with the vibrating strings of the transmitter would be thrown into sympathetic vibration by the molecular changes, and that the amplitude of the vibration of each of those strings would be dependent upon the amplitude of the vibration of the corresponding strings of the transmitter, and that thus a sound would be produced from the receiver of similar quality or *timbre* to that which occasioned the vibration of the wires of the transmitter. I further thought that a single wire could be used in place of the single reed of my membrane arrangement. My idea was to stretch a wire parallel to the surface of my stretched membrane, and to attach the centre of the membrane to the wire. I presumed that upon speaking to the membrane, the wire would be forced into vibration, and that the changes of tension would produce an effect upon the continuous current passed through the wire similar to the resultant effect produced by the stretched-string harp transmitter, and that the quality or *timbre* of the sound uttered against the membrane could be produced from a reed membrane receiver, or from a stretched-wire receiver similar to the transmitter employed. I was quite familiar with the fact that the elements of speech differ from one another in *timbre;* and when I speak in this letter of my "plan for transmitting *timbre*," I mean my method of transmitting articulate speech.

Int. 65. What advantage is it in a system of multiple harmonic telegraphy to transmit quality as well as pitch of sound?

Ans. No advantage whatever.

Int. 66. This letter of May 4, 1875, speaks of having received a letter from Mr. Pope about some prepared paper. Was that Mr. Frank L. Pope, the electrician of the Western Union Telegraph Company, and what did you want prepared paper for at that time?

Ans. I believe that was Mr. Frank L. Pope, electrician of the Western Union Telegraph Company. I wanted to obtain chemically prepared paper for use in my system of autographic telegraphy, for which I obtained Letters Patent of the United States in April 6, 1875.

Int. 67. Please look at the letter now shown you, dated May 24, 1875. State whether you wrote it and sent it to your father at the time of its date; and if so, read it as part of your answer.

[*Objected to as incompetent.*]

Ans. I did, and I now read it.

"SALEM, MASS., May 24, 1875.

"*Dear Papa and Mamma:*

"I am so immersed in telegraphy and science that I find it impossible to write freely about anything else; but I feel that at the present time you can scarcely be inclined to listen to anything I have to say on such subjects.

"Since I gave up professional work and devoted myself exclusively to telegraphy, I have been steadily gaining health and strength,

EPHONE COMPANY,-3

and am now in a fit state to encounter Mr. Gray or any one else. The patents that have been granted to me without opposition are, —

"1st. The principle of converting a vibratory motion into a permanent make or break of a local circuit.

"2d. The special form of 'vibratory circuit breaker' put in illustration.

"3d. The autograph telegraph.

"The autograph arrangement is rapidly approaching completion. Already I can copy handwriting *quite legibly*, though not yet neatly. The rate of transmission by means of my instrument will be exactly ten times more rapid than 'Bakewell's Autograph Telegraph,' in which the rate is 300 letters per minute. When 3,000 letters per minute can be sent, my telegraph will be the most rapid as well as the cheapest.

"Every moment of my time is devoted to study of electricity and to experiments. The subject broadens. I think that the transmission of the human voice is much more nearly at hand than I had supposed. However, this is kept in the background just now, as every effort is to be made to complete the autograph arrangement, so as to have it used on some line.

"The two patents for the transmission of musical notes are not decided yet. I can't understand why the interference should not have been declared before this. Here are some late discoveries: 1. The current from one of my instruments passed through an iron wire causes a musical note to issue from the wire. 2. The same effect is produced by passing the current through a piece of carbon. 3. Ditto when it is forced through the plumbago of an ordinary lead pencil ! ! ! No similar effects noted yet with copper, brass, or mercury.

"A still more curious phenomenon is the following: —

"Two thin strips of brass (A and B) are connected with the wires coming from my transmitting instrument, T, and from the battery. On holding A to my ear I hear nothing, but the moment that I touch B with my finger a musical note is heard to proceed from A ! !

"Truly, the more I study electricity and magnetism the more I feel the truth of Hamlet's saying, 'There are more things,' etc.

"I fear that this telegraphic business may force me to remain the membrane to the wire. I presumed that upon speaking to the membrane, the wire would be forced into vibration, and that the changes of tension would produce an effect upon the continuous current passed through the wire similar to the resultant effect produced by the stretched-string harp transmitter, and that the quality or *timbre* of the sound uttered against the membrane could be produced from a reed membrane receiver, or from a stretched-wire receiver similar to the transmitter employed. I was quite familiar with the fact that the elements of speech differ from one another in *timbre;* and when I speak in this letter of my "plan for transmitting *timbre*," I mean my method of transmitting articulate speech.

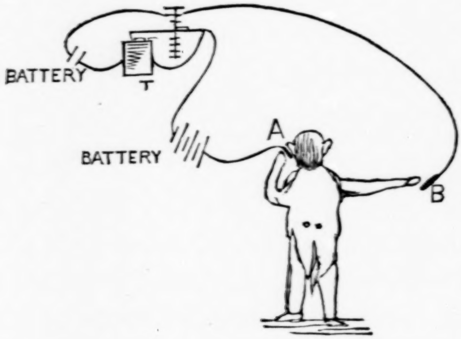
"I fear that this telegraphic business may force me to remain the

AMERICAN BELL TELEPHO



greater portion of the summer here, but I cannot tell yet, so many details have to be worked out. My inexperience in such matters is a great drawback. However, Morse conquered his electrical difficulties although he was only a painter, and I don't intend to give in either till all is completed.

" With dear love,

" Your affectionate son,

" ALECK."

[*The original is marked by the examiner with his initials and the date July* 9, 1879, *for identification.*]

Int. 68. Did you try at Mr. Fenollosa's rooms the experiment proposed in your letter to Mr. Hubbard of May 4; and if so, with what results?

Ans. I tried the experiments proposed within a day or two of the letter to Mr. Hubbard. I first passed an intermittent current from a current interrupter through that string of a piano which seemed to be in unison with the interrupter, and observed whether the string was thrown into sympathetic vibration. It was not. I then listened very closely to the piano, for the purpose of ascertaining whether any noise proceeded from the wire. I heard the pitch of the interrupter, but whether the sound was transmitted through the air from the adjoining house, or proceeded from the string in question, I was not able to satisfy myself. A continuous current was then passed through one of the wires of the piano, and through the coils of an electro-magnet in the adjoining house. Over the pole of that electro-magnet projected the free end of a steel reed which was tuned to the pitch of the string. The string of the piano was then set in vibration by depressing the proper key of the piano, and the effect upon the reed noted. The reed was not thrown sympathetically into vibration. Upon placing my ear against the steel reed, I could hear very faintly the tone of the string, but I was unable to satisfy myself whether the sound I heard was electrically produced, or had been transmitted mechanically to my ear. The piano was in an adjoining house, and the sound was faintly audible in the room where I tried the experiment.

Int. 69. Have you since that day ever tried to work a telephonic receiver by vibrating a stretched wire through which a continuous current of electricity was passing on to the main line in the manner proposed in your letter of May 4? And if so, describe such experiment with its results, and state when you made it.

Ans. I have made the experiment, but I cannot at the present moment fix the exact date. My impression is it was during the month of February of the present year; at any rate, it was during this present year. I passed a continuous current through a fine stretched iron or steel wire which was placed in one of the rooms in Mr. Williams's building, 109 Court Street. The circuit was continued into another room, and the current passed through the coils of an ordinary hand telephone. While I listened at the telephone, Mr. Edward Wilson kept plucking the stretched wire. I heard distinctly from the telephone a musical tone each time the wire was plucked, and recognized, moreover, the peculiar quality or *timbre* of the wire. I satisfied myself, by short-circuiting the telephone and by breaking the circuit, that the sound I heard had been electrically produced.

Int. 70. Please look at the letter now shown you, dated June 2, 1875, which is one of those identified in the deposition of Mr. Hubbard, pages 431* and 440. State whether you wrote it and sent it to Mr. Hubbard at the time of its date; and if so, read it as a part of your answer.

[*Objected to as incompetent*]

---

* These references are to pages of the printed record in the suit *Bell Telephone Company* v. *Dowd.*

Ans. I did, and I now read it: —

"SALEM, MASS., June 2, 1875.

"*Dear Mr. Hubbard:*

"I have accidentally made a discovery of the very greatest importance in regard to the transmitting instruments. Indeed, so important does it seem to me that I have written to the organ factory to delay the completion of the reed arrangement until I have had the opportunity of consulting you.

"I have succeeded to-day in transmitting signals *without any battery whatever!*

"The musical note produced at the receiving end was sensibly the equivalent of that at the transmitting end in *loudness* as well as pitch.

"I shall call upon you to-morrow (Wednesday) evening, as there are several matters I wish to talk over with you.

"In haste,
"Yours respectfully,
"A. GRAHAM BELL.

"GARDINER G. HUBBARD, Esq.,
Brattle Street, Cambridge."

Int. 71. Did you, on the 2d of June, 1875, perform the experiment stated in that letter? And if so, state where, and describe the experiment fully.

Ans. I did. The experiment was made in the upper part of Mr. Williams's building, No. 109 Court Street, in two small rooms that Mr. Williams had allowed me to use for experimental purposes. I was carrying on a series of experiments for the purpose of perfecting for practical use my system of autograph telegraphy, which was a development of my harmonic telegraph. I had arranged three experimental stations upon a single line wire, which for convenience of reference I shall designate A, B and C. At station A were arranged a number of current interrupters, whose rates of vibration were different, and a number of telegraph keys corresponding to the interrupters. By the depression of any key, the intermittent current from the corresponding interrupter was directed on to the line wire to the stations B and C. At each station, B and C,

EPHONE COMPANY,-3

were placed harmonic receivers corresponding in pitch to the interrupters at station A. Each receiver consisted of a horseshoe electro-magnet, to one pole of which was clamped one end of a steel reed, the free end of which projected over the other pole of the magnet. A coil of insulated wire surrounded that leg of the magnet which was presented to the free end of the reed. Stations A and B were in one room, and station C in the adjoining room. I took charge of stations A and B during the experiment referred to, and Mr. Thomas A. Watson took charge of station C. We were making an experiment to ascertain whether the receiving reeds were properly tuned to their corresponding interrupters, and whether the operation of one interrupter interfered with that of the others when the keys were simultaneously depressed. I pressed down one key at station A and observed whether the proper reed at station B was thrown into forcible vibration, and Mr. Watson observed whether the proper reed of station C was similarly affected. Upon trying all the keys in succession it was found that one of the receivers at station C failed to respond. As we very often found that the magnets of the receivers were so closely adjusted to the reeds that the reeds would stick to the pole when a powerful current was passed, I thought that this might be the cause of the failure in the present case. I therefore called out to Mr. Watson to pluck the reed with his finger. He did so, and I imagined that the corresponding reed of station B was thrown momentarily into vibration. I was struck by this, as I had not depressed the key of the corresponding interrupter, and could not see where the current came from to operate that receiver. I therefore requested Mr. Watson to pluck the reed at station C a number of times, and found that I had not been mistaken in my observation. To test the matter still further I removed station A from the circuit altogether, and connected the receivers of B and C upon a closed circuit without any battery. Upon plucking with the finger any reed of station C, it was found that the corresponding reed of station B was thrown into sympathetical vibration, and *vice versa*. I then requested Mr. Watson to pluck one of the reeds of station C a number of times, while I placed my ear against all the reeds of station B in succession; I could hear from each reed the peculiar tone of the reed plucked at station C, and recognized that the *timbre* of the plucked reed had been reproduced. We then placed a single receiver at station C in circuit with a single receiver at station B, and repeated the experiments. The results were much more marked. Upon plucking the reed at station C, its sound was reproduced by that at station B; and upon plucking the reed at station B, its sound was reproduced by that at station C. When the two reeds employed were in unison with one another, the plucking of one resulted in the visible vibration of the other, the amplitude of vibration often being considerable. No battery was used. Upon placing a battery in the circuit, the same effects were observed and the results were more marked.

[*Adjourned to July* 10, 1879, *at* 10 *A. M.*]

BOSTON, July 10, 1879.

Int. 72. When you used the apparatus without a battery, as stated in your last answer, what generated the electrical impulses which went over the line wire and vibrated the receiver?
